Light

Light, a basic aspect of the human environment, cannot be defined in terms of anything simpler or more directly appreciated by the senses than itself. Light, certainly, is responsible for the sensation of sight. Light is propagated with a speed that is high but not infinitely high. Physicists are acquainted with two methods of propagation from one place to another, as (1) particles and as (2) waves, and for a long time they have sought to define light in terms of either particles or waves. In the early 19th century a wave description was favoured, though it was difficult to understand what kind of wave could possibly be propagated across the near-vacuum of interstellar space and with the extremely high speed of 300,000 kilometres per second (186,000 miles per second). In the latter half of the 19th century a British physicist, James Clerk Maxwell, showed that certain electromagnetic effects could be propagated through a vacuum with a speed equal to the measured speed of light. Thus, in the second half of the 19th century, light was described as electromagnetic waves (see ELECTROMAGNETIC RADIATION). Such waves were visualized as analogous to those on the surface of water (transverse waves) but with an extremely short wavelength of about 500 nanometres (one nanometre is 10^{-9} metre). The analogy is valid up to a certain point but the experimental results obtained at the end of the 19th century and in the early years of the 20th century revealed properties of light that could not have been predicted from knowledge that was obtainable about other waves. These results led to the quantum theory of light, which in its primitive form asserted that, at least in regard to its emission and absorption by matter, light behaves like particles rather than waves. The results of certain important experiments on the spreading of light into shadows and other experiments (on the interaction of beams of light) that supported the wave theory found no place in a particle theory. For a time it was believed that light could not be adequately described by analogy with either waves or particles—that it could be defined only by a description of its properties. A reconciliation of wave and particle concepts did not emerge until after 1924.

Two properties of light are, perhaps, more basic and fundamental than any others. The first of these is that light is a form of energy conveyed through empty space at high velocity (in contrast, many forms of energy, such as the chemical energy stored in coal or oil, can be transferred from one place to another only by transporting the matter in which the energy is stored). The unique property of light is, thus, that energy in the form of light is always moving, and its movement is only in an indirect way affected by motion of the matter through which it is moving. (When light energy ceases to move, because it has been absorbed by matter, it is no longer light.)

The second fundamental property is that a beam of light can convey information from one place to another. This information concerns both the source of light and also any objects that have partly absorbed or reflected or refracted the light before it reaches the observer. More information reaches the human brain through the eyes than through any other sense organ. Even so, the visual system extracts only a minute fraction of the information that is imprinted on the light that enters the eye. Optical instruments extract much more information from the visual scene; spectroscopic instruments, for example, reveal far more about a source of light than the eye can discover by noting its colour, and telescopes and microscopes extract scientific information from the environment. Modern optical instruments produce, indeed, so much information that automatic methods of recording and analysis are needed to enable the brain to comprehend it.

From the standpoint of wave motion, blue light has a somewhat higher frequency and shorter wavelength than red. In the quantum theory, blue light consists of higher energy quanta than the red.

The subject of light is so wide and its associations are so numerous that it cannot be accommodated within one article of reasonable length. There are three main divisions of the subject of light: physical optics, physiological optics, and optical instrumentation. This article deals primarily with physical optics, treating the nature and behaviour of light. It also discusses the interaction of light with matter and describes such phenomena as luminescence in considerable detail. Although electromagnetic theory is considered here, further elucidation may be obtained in the article ELECTROMAGNETIC RADIATION. The article SENSORY RECEPTION includes the physiological and psychological aspects of light, while the section *Optical Engineering* in the article OPTICS treats the theory and technology of lenses, mirrors, and optical systems. The experimental evidence that led to the quantum theory of radiation is included in the present article along with a brief statement of some of the basic ideas. The quantum theory of radiation, however, is so closely associated with the quantum theory of matter that the two must be considered together, as is done in the section on *Quantum mechanics* of the MECHANICS article. (R.W.Di./Ed.)

The article is divided into the following sections:

General considerations

HISTORICAL SURVEY

From 500 BC to AD 1650. In this period, there were innumerable confusions and false starts toward an understanding of light. Sometimes an idea was stated, though not clearly, and then almost forgotten for centuries before it reappeared and was generally accepted. The uses of plane and curved mirrors and of convex and concave lenses were discovered independently in China and in Greece. References to burning mirrors go back almost to the start of history, and it is possible that Chinese

and Greek knowledge were both derived from a common source in Mesopotamia, India, or Egypt. The formulation of general empirical laws and of speculation about the theory of light derives mainly from Mediterranean (Greek and Arab) sources. Pythagoras, Greek philosopher and mathematician (6th century BC), suggested that light consists of rays that, acting like feelers, travel in straight lines from the eye to the object and that the sensation of sight is obtained when these rays touch the object. In this way, the more mysterious sense of sight is explained in terms of the intuitively accepted sense of touch. It is only necessary to reverse the direction of these rays to obtain the basic scheme of modern geometrical optics. The Greek mathematician Euclid (300 BC), who accepted the Pythagorean idea, knew that the angle of reflected light rays from a mirror equals the angle of incident light rays from the object to the mirror. The idea that light is emitted by a source and reflected by an object and then enters the eye to produce the sensation of sight was known to Epicurus, another Greek philosopher of Samos (300 BC). The Pythagorean hypothesis was eventually abandoned and the concept of rays travelling from the object to the eye was finally accepted about AD 1000 under the influence of an Arabian mathematician and physicist named Alhazen.

Pythagorean hypothesis of light

Angles of incidence and of refraction—*i.e.*, the change in direction of a light ray going from one transparent medium to another—were measured by an astronomer, Ptolemy, in the 1st century in Alexandria. He correctly deduced that the ray is bent toward the normal (*i.e.*, the direction perpendicular to a boundary plane, such as the plane separating air and water) on entering the denser medium. A Dutchman, Willebrord van Roijen Snell, discovered the so-called sine law that gives the index of refraction (a measure of the change in direction) for light in a transparent medium. The laws of reflection and refraction were brought together by a 17th-century French mathematician, Pierre de Fermat, who postulated that the rays of light take paths that require a minimum time. He assumed that the velocity of light in a more dense medium is less than that in a less dense one in the inverse ratio of the indices of refraction.

Fermat's principle

The idea of rectilinear propagation of light—that is, that it travels in a straight line—was applied in a practical sense to drawing and painting long ago. Euclid was familiar with the basic idea, but the main theory was developed by Leonardo da Vinci, and a complete description of shadows was given by the Danish astronomer Johannes Kepler in 1604. Kepler also was the first to apply the laws of rectilinear propagation to photometry (the measurement of light intensities).

From 1650 to 1895. At the beginning of this period, the result of the conflict between the corpuscular theory and the wave theory was in doubt. At the end of the period, the wave theory was generally accepted and seemed capable of explaining all known optical phenomena though, with hindsight, it can now be seen that there were some important difficulties.

Diffraction—*i.e.*, the spreading of light into shadows—was first observed in Italy in the 17th century. In England, a worker, who independently noticed diffraction, also observed the interference colours of thin films, which are commonly seen today in an oil film on a wet road surface or in the iridescent colours of a butterfly's wing. He believed that light consists of vibrations propagated at great speed. Christiaan Huygens, of Holland, greatly improved the wave theory. In England, Sir Isaac Newton did not attach much importance to the small amount of spreading of light, and he knew that strictly rectilinear propagation could not be reconciled with the wave theory. Polarization phenomena (which can be accounted for by transverse wave motion in a single plane) discovered in the 17th century by a Danish physicist, Erasmus Bartholin, and by Huygens were not consistent with the theory of longitudinal waves (waves vibrating in the direction of propagation, like compression waves in a coiled spring), which was the only wave theory then considered. Newton therefore supported the corpuscular theory, although he did not reject the wave theory completely. He accepted a concept of a luminiferous ether, and he postulated that the particles had "fits of easy reflection" and "fits of easy transmission"; *i.e.*, he assumed that they changed regularly between (1) a state in which they were reflected at a glass surface and (2) a state in which they were transmitted. He thus introduced periodicity—one of the basic ideas of wave theory—in a form that anticipates the quantum mechanics. Newton, using a glass wedge, or prism, discovered that white light can be separated into light of different colours and took the first steps toward a theory of colour vision.

In the century following his death the great authority of Newton was quoted to uphold the corpuscular theory and to oppose the wave theory in a way that he probably would not have approved. It was not until the 19th century that the work of Thomas Young of England; Augustin-Jean Fresnel, François Arago, and Armand-Hippolyte-Louis Fizeau, all of France; Irish scientist Humphrey Lloyd; and German physicist Gustav Kirchhoff established the transverse-wave concept of light; *i.e.*, light is a wave vibration at right angles to the direction of travel. A universal medium pervading all space and called the ether was supposed to be some kind of elastic solid. This made it possible to accept the transmission of light through a vacuum, but there was no completely satisfactory theory of the ether or of the way in which light is modified by transparent materials like glass. The necessity for an elastic solid disappeared when Maxwell proposed an electromagnetic theory of light. He stated the laws of electromagnetism in a clear mathematical form and generalized the concept of an electric current. From his equations he predicted the existence of transverse electromagnetic waves having a constant speed *c in vacuo*. The constant *c* had a value of 300,000 kilometres per second and was derived from measurements on electrical circuits. It was known from the work of Ole Rømer, a Danish astronomer; Jean-Bernard-Leon Foucault of France; and others that the velocity of light was not much different from the velocity constant *c*. A.A. Michelson, a physicist in the United States, measured the velocity of light and showed that it is equal to *c* within a small margin of experimental error. This result, together with the work of a German physicist (Heinrich Rudolf Hertz) on electromagnetic waves of larger wavelength, confirmed Maxwell's predictions (see ELECTROMAGNETIC RADIATION). The existence of a connection between electromagnetism and light had, indeed, been demonstrated in England much earlier in the century by Michael Faraday, who observed the rotation of the plane of polarization of a beam of light by a magnetic field (Faraday effect).

Transverse wave concept established

From 1900 to the present. Maxwell's theory is a theory of waves in a continuous (*i.e.*, infinitely divisible) medium. The energy of the waves is also infinitely divisible so that an indefinitely small amount can be emitted or absorbed by matter. Classical physical theories of the 19th century had predicted that in such a system the energy in equilibrium would be distributed so as to give an equal amount to each mode (frequency) of vibration. Because a continuous medium has an infinite number of modes of vibration, and the atoms (which constitute matter) have only a finite number, all the energy of the universe would be transformed into waves of high frequency. Maxwell understood this difficulty, which was later most clearly stated in the Rayleigh–Jeans law (after two English physicists, Lord Rayleigh and Sir James Hopwood Jeans) of the radiation of a blackbody (a body in which the intake and output of energy are in equilibrium). The German physicist Max Planck demonstrated that it is necessary to postulate that radiant-heat energy is emitted only in finite amounts, which are now called quanta. At first, it was hoped to retain, without modification, the theory of light as electromagnetic waves in free space and to use the quantum concept only in relation to the interaction between radiation and matter. In 1905, however, Einstein showed that, in the photoelectric effect, light behaves as if all the energy were concentrated in quanta—*i.e.*, particles of energy now called photons. In the same year, Einstein published the theory of relativity, which modified the whole of physics and gave a special role to the velocity constant *c*. Because light, in some situations, behaves like waves and, in others, like particles, it is necessary to have

The role of the velocity of light in relativity theory

a theory that predicts when and to what extent each kind of behaviour is manifested. The main development of the quantum mechanics, which does precisely this, took place between 1925 and 1935.

Light from ordinary sources is emitted by atoms the phases of which are not correlated with one another, so that there is a random irregularity or incoherence between the waves emitted from different atoms. This places severe restrictions on the conditions under which the periodicity associated with wave theory can be observed. In England, Lord Rayleigh appreciated this effect and knew that, by the use of pinholes or slits and light of a narrow range of wavelength, effectively coherent light could be produced. For a long time, interest in this topic lapsed. About 1935 Frits Zernike, a Dutch physicist, and others extended the theory of coherence to include the concept of partial coherence. This appeared to be of practical importance only in a few rather special applications (*e.g.*, in the Michelson stellar interferometer; see below *Interference*). A theory of stimulated emission, attributable to the work of Einstein and an English physicist, Paul A.M. Dirac, postulated that under certain conditions atoms could be made to radiate in phase so that highly coherent radiation could be maintained indefinitely. The practical realization of these conditions, previously thought to be impossible, was achieved in 1960.

A second major development in the theory of light in this century is the application of so-called Fourier transform methods (a mathematical treatment of light waves) to a wide range of optical problems and, especially, to the transfer of information in optical systems (see OPTICS).

Information transfer in optical systems

Today, the theory of light has again reached a point at which all known terrestrial phenomena are included in one logical theory. The known unsolved problems concern the transmission of light over the vast distances of intergalactic space. Here the theory of light impinges on the science of cosmology.

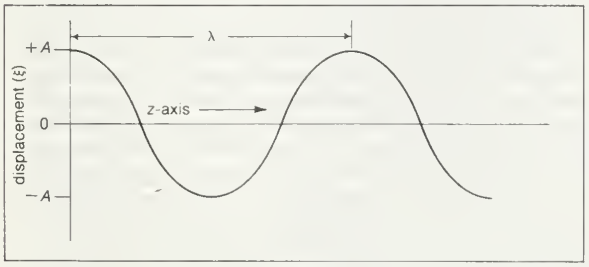
BASIC CONCEPTS OF WAVE THEORY

In this section on the wave theory of light, those properties of light that are consistent with a wave theory are described using a minimum of mathematical formulation. It is convenient to introduce the basic concepts of wave theory in relation to mechanical systems. Below, in the section on *Interference*, and beyond, it will be necessary to consider results obtained by more sophisticated mathematical methods, such as Fourier analysis.

General characteristics of waves. *Periodicity in time and space.* If one end of a stretched rope is vibrated, a wave will run along the rope. Figure 1 (top) represents a profile of the wave—*i.e.*, a "snapshot" of the displacement of the rope from its normal position. It gives the variation of this displacement (indicated by ξ) at different points (z) along the axis of propagation for one specific instant of time. Similarly, Figure 1 (bottom) shows the variation with time of the displacement at one arbitrary point on the axis. In Figure 1 (top) the distance between successive crests is constant and is called the wavelength (λ). Similarly, the constant time between crests in Figure 1 (bottom) is called the period (τ). The temporal frequency ($\nu_t = 1/\tau$) is the number of vibrations per unit time and the spatial frequency or wave number ($\nu_s = 1/\lambda$) is the number of waves per unit length. The wave shown in Figure 1 (top) may be represented by the cosine of an angle (φ) to give the displacement for a particular point on the axis at any instant of time:

$$\xi = A \cos \Phi = A \cos 2\pi (\nu_t t - \nu_s z), \qquad (1)$$

in which ξ is the displacement at any point z on the axis at a time t, A is the amplitude (the maximum displacement); the angle φ (phi) in this case is equal to $2\pi(\nu_t t - \nu_s z)$ and is called the phase angle, or simply, the phase.



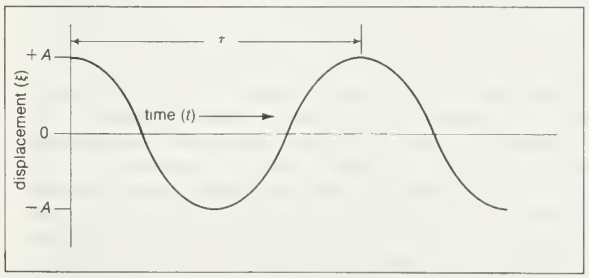


Figure 1: *Wave profiles.*
(Top) Variation with position at one time. (Bottom) Variation with time at one place (see text).

Energy. The energy per unit volume (W) stored in a wave motion is proportional to the square of the amplitude (A) so that, with a suitable choice of units, $W = A^2$.

Phase velocity. Any one crest moves forward a distance λ in a time τ; *i.e.*, with a velocity b of the wavelength divided by the period or the temporal frequency divided by the spatial frequency,

$$b = \frac{\lambda}{\tau} = \frac{\nu_t}{\nu_s} = \lambda \nu_t. \qquad (2)$$

The velocity b is called the phase velocity because the phase angle φ will remain constant when the time t changes by an incremental amount t_0 and z changes by $z_0 = bt_0$. (This may be seen by substituting $t = t_0$ and $z = z_0$ in the expression for this phase and using $b = \nu_t/\nu_s$.)

Relation of phase velocity to the medium

The velocity of light in vacuum (denoted by c) is the same for all frequencies; all colours travel through space with the same speed. The phase velocity (denoted by b) in a material medium, on the other hand, depends on the medium and on the temporal frequency and, hence from equation (2), on the wavelength.

Wave surfaces. Two-dimensional waves are formed by vibrating (dipping) the end of a rod up and down in the surface of a liquid. Waves spread from the point of origin (where the rod contacts the surface) and, at any moment, the phase at any point on a circle is the same; *i.e.*, if, at a given moment, the wave is at a maximum at one point on a circle then it is at a maximum everywhere on this circle, and the circle as a whole is a wave crest. Similarly, a trough is found at all points on another circle (the radius of which is $\lambda/2$ greater than that of the first circle). As the waves progress farther and farther from the origin, they become less strongly curved about the origin so that, at great distances, they are approximately plane waves.

Light waves are propagated in three dimensions and, for waves from a point source in an isotropic medium (*i.e.*, one in which the speed is the same along any radius), the phase is constant over spherical surfaces drawn about the point source as a centre. The surfaces of constant phase are called wave surfaces, and waves are called plane, spherical, ellipsoidal, and so on according to the shapes of the wave surfaces.

Reflection and refraction. The similarity between the behaviour of light waves and the surface waves of a liquid may be demonstrated with the so-called ripple tank. For reflection of a train of surface waves incident on a flat object, it may be readily observed that the angle of reflection is equal to the angle of incidence. For waves that are refracted in passing from one medium of the ripple tank in which the phase velocity is b_1, to another in which the phase velocity is b_2, measurements of angles of incidence (θ_i) and refraction (θ_r) of the surface waves verify Snell's sine law of refraction; *i.e.*, that the ratio of the sines of the angle of incidence and refraction is a constant, or

$$\frac{\sin \theta_i}{\sin \theta_r} = \frac{b_1}{b_2} = n_{12}, \qquad (3)$$

in which the constant n_{12} is called the index of refraction from medium 1 to medium 2. The index of refraction (n)

from vacuum to a material medium is called the index of the medium and, for transparent mediums is always greater than unity (one). When n_{12} is less than unity, as happens when light is refracted as it passes from glass into air, the refracted ray grazes the surface if $\sin \theta_i = n_{12}$, θ_i being the angle of incidence in the glass. At angles of incidence greater than this critical angle there is total reflection; *i.e.*, light, instead of penetrating into the air, is reflected back into the glass.

Dispersion. Newton found that, when a beam of white light is refracted by a glass prism, it is dispersed, or split, into beams of different colours. This phenomenon is now interpreted in the following way: the velocity of light in glass varies fairly rapidly with its wavelength, whereas its velocity in air varies little; thus the index of refraction and hence the angle of refraction depend on wavelength. A beam of white light, containing as it does a wide range of wavelengths, is thus dispersed by a glass prism so that light of one wavelength emerges from it in a different direction from light of another wavelength. Because colour depends on wavelength, the emergent light forms a spectrum (see Plate). All material mediums are, to some extent, dispersive (*i.e.*, phase velocity varies with the temporal or spatial frequency).

Wave groups. When a stone is dropped into a quiescent pond, a few waves may be seen travelling out from the point of impact. This group of waves maintains its identity as it is propagated over a considerable distance, although it finally dies away. The velocity of the group as a whole is called the group velocity. Careful observation shows that the group velocity is less than the phase velocity. Individual waves may be seen to appear at the back of the group, advance through it, and die out as they reach the front of the group. In a nondispersive medium the group velocity is equal to the phase velocity, while in a dispersive medium it may be greater than, less than, or equal. For light waves, the group velocity is almost always less than the phase velocity.

Group velocity

Interference. When two or more wave motions are present at the same place and time, the simplest assumption is that the resultant displacement (ξ_R) is the algebraic sum of the individual displacements (ξ_1, ξ_2, ξ_3, etc.), *i.e.*,

$$\xi_R = \xi_1 + \xi_2 + \xi_3 + \cdots + \xi_N. \qquad (4)$$

Nearly all observations on light are in accord with this equation, which is a statement of the principle of superposition. These phenomena constitute the subject of what is known as linear optics. The possibility that additional phenomena might be observed at high intensities of light has long been accepted, and the use of lasers in the attainment of the necessary high intensities has led to the discovery of frequency doubling and other effects that cannot be predicted from equation (4). These new observations constitute the material of nonlinear optics (see OPTICS). Equation (4) is valid for all the phenomena of interference, diffraction, etc., which will be described in this article.

Two waves are said to be coherent if their phase difference remains constant during a period of observation. Figure 2 shows two equal coherent plane waves travelling across the same space, with the wave fronts inclined at a small angle α, AB representing a surface corresponding to a crest of one wave. (The surface must be assumed to be perpendicular to the page.) C_1 D_1, C_2 D_2, etc., represent surfaces that correspond to crests of the other wave. The intermediate dotted lines represent troughs. At points such as P_1 (and P_2, P_3, . . .), a crest of one wave coincides with a crest of the other and according to the principle of superposition the displacement is twice that of either wave alone. At points Q_1, Q_2, etc., a crest of one wave meets a trough of another; so the displacements being equal and opposite, the resultant is zero. Thus, an observer looking at a plane that is perpendicular to the page and passes through AB sees a series of straight lines through P_1, P_2, P_3, etc., representing large displacement and a series of lines through Q_1, Q_2, Q_3, etc., representing zero displacement.

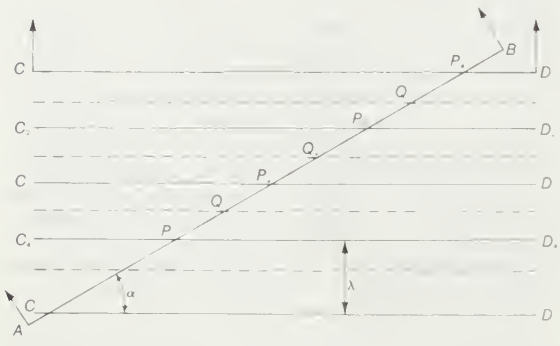

Figure 2: Interference of two plane waves AB and CD with directions inclined at an angle α. The crests of CD are represented as C_1D_1, C_2D_2, etc., and the troughs are shown as broken lines (see text).

There are many ways in which coherent beams of light can be made to cross at an angle of about one part in a thousand. The eye (or a low-power magnifier) can be focussed on a plane such as that through AB. The resulting parallel light and dark lines are called interference fringes (Figure 3). From Figure 2 it may be seen that the separation (d) of two bright fringes is λ/α or $1{,}000\ \lambda$ if $\alpha = 0.001$. When α has this value, $d = 0.5$ millimetre for blue-green light and this would imply that λ is about 0.5×0.001 or 1/2,000 part of a millimetre (this is usually written 500 nanometres).

Interference fringes

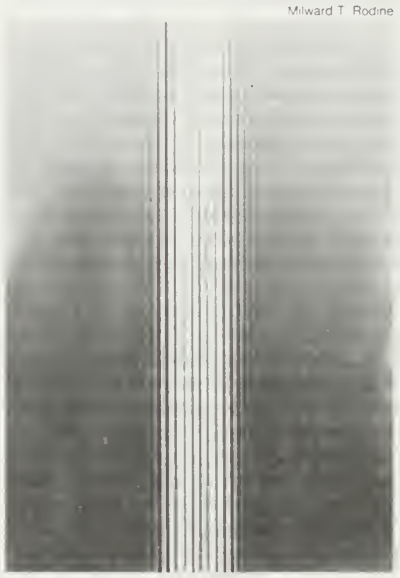

Figure 3: Two-beam interference fringes from Young's double slits or Fresnel's biprism (see text).

In this experiment the spatial periodicity of the light waves (about 2,000 waves per millimetre) has been made to produce fringes with periodicity of about two per millimetre. The spatial periodicity of a light wave is too high for the human eye, and it cannot be magnified directly. Interference methods effectively magnify it so that the resultant fringes can be seen by eye or with a convenient magnification. The following method of producing interference fringes, developed by Thomas Young, is now called Young's experiment.

In the arrangement shown in Figure 4, light of one wavelength passes through a slit S producing semicylindrical waves that are intercepted by two other slits P_1 and P_2. The two slits P_1 and P_2 act as secondary sources of coherent, semicylindrical waves the combined effect of which is observed on the plane perpendicular to the page and designated AB. In a typical case the separation (a) of P_1 and P_2 is a millimetre and the distances l_1 and l_2 are each about a metre. The slits are a centimetre or so long but are much less than a millimetre wide. They are accurately parallel to one another and, as represented in the drawing, are at right angles to the page. Because the waves from P_1 and P_2 are indirectly derived from the same small source, they are coherent. When they cross plane AB they are

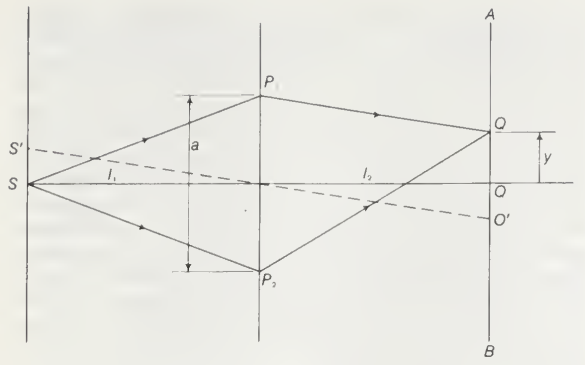

Figure 4: Young's experiment (see text).

nearly plane because of the large radius, and they intersect at an angle α equal to 0.001. It may be shown that the intensity (I) for these fringes varies from point to point along the line AB in the way shown in Figure 5 (curve A), which is in accord with the equation

$$I = 2A^2(1 + \cos \varepsilon) = 2I_0(1 + \cos \varepsilon)\,, \qquad (5)$$

in which A is the amplitude of either wave, I_0 is the intensity of one wave acting alone and the phase difference $\varepsilon = 2\pi ya/\lambda l_2$. Bright fringes are seen in positions for which $\varepsilon = 2\pi p$ or $y = p\lambda/l_2 a$ (in this case p is a whole number, which may be positive, zero or negative—0, ±1, ±2, ±3, etc.). Because cos ε varies from −1 to +1, I varies from $4I_0$ to zero. The average, in accordance with the law of conservation of energy, is $2I$.

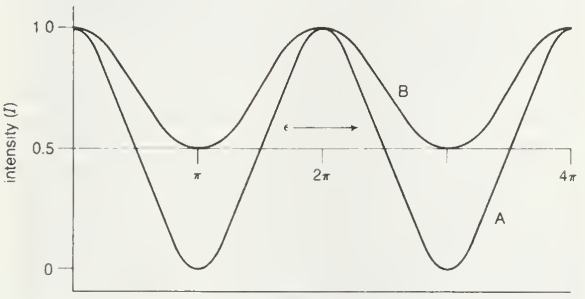

Figure 5: Interference fringes obtained in Young's experiment (see text).

Diffraction. Plane waves that pass through a restricted opening emerge as divergent waves. When the opening is less than one wavelength in diameter the emergent wave is nearly spherical. Whenever a beam of light is restricted by holes or slits or by opaque obstacles that block out part of the wave front, some spreading occurs at the edges of geometrical shadows. This effect, called diffraction, is also obtained with transparent obstacles that cause an irregularity in the wave front. Diffraction can be demonstrated by allowing a parallel beam of light to fall on a grating consisting of an array of equally spaced narrow slits. If the extent of physical separation of two adjacent slits is e, then the path difference between any two adjacent rays emitted in a direction symbolized by θ is $e \sin \theta$, and if this path difference is an integral number (p) of wavelengths,

$$e \sin \theta = p\lambda, \text{ or } \nu_s \sin \theta = pg\,, \qquad (6)$$

in which ν_s is the spatial frequency ($1/\lambda$) and g is the number of lines per unit width of the grating, then the waves from different slits have phases that differ by angles of $2p\pi$, and they reinforce one another. Thus, when lenses are employed with a grating, sharp lines are obtained for each wavelength at values of θ corresponding to integral values of p. If white light is used, each line is drawn out into a spectrum of wavelengths because the direction of reinforcement depends on the wavelength.

Polarization. In the propagation of waves on a rope or across the surface of a liquid the displacement (as shown in Figure 1) is in a direction perpendicular to the direction of propagation and the waves are said to be transverse. Sound waves in a gas consist of alternate dilation and compression and the displacement is in the direction of propagation. The waves are longitudinal. If a beam of longitudinal waves is propagated in a vertical direction, there is nothing to distinguish one azimuthal plane from another—everything that is true for an east–west plane is equally true for a north–south plane. With transverse waves the displacement may be in the east–west plane; in that case, there is no component in the north–south plane, and this should manifest itself in the form of a property that depends on the azimuth. Such an effect is called an azimuthal property. An ordinary beam of light from a thermal source does not exhibit any azimuthal property, but experiments show that light can have an azimuthal property and must be represented by transverse waves.

Azimuthal property

If an unsilvered glass plate has an index of refraction equal to 1.5 and the angle of incidence of a beam of light is 57°, about 15 percent of the light will be reflected from the two glass surfaces of the plate (Figure 6); this percentage will not be altered when the glass plate is rotated about an axis parallel to the beam of light so as to change the azimuth of the plane of reflection. If a second mirror (G_2), parallel to the first (G_1), is used to reflect the beam in the same plane as that of the original reflection, about 30 percent of the light incident on the second plate of glass will be reflected; but if the second plate is turned so as to reflect the light in a plane perpendicular to that of the first reflection—*i.e.*, out of the plane of the page—hardly any light will be reflected. Thus, after the first reflection, the beam of light will have acquired an azimuthal property—it will be reflected more strongly when the transverse displacement is in one azimuthal plane than when in another. Further tests will show that the transmitted light has a complementary azimuthal property; it is more strongly reflected in the perpendicular plane—though the difference is less marked.

These results may be understood if ordinary light consists of a mixture of transverse waves with displacements in all azimuthal planes but only one component is reflected from a glass surface when the angle of incidence is 57°. The reflected light is said to be plane-polarized because all of the displacement of the wave is in one azimuthal plane. The transmitted light (about 85 percent of the whole) contains about 50 parts of a component that is polarized in a perpendicular plane and about 35 parts of light that is polarized in the same way as the reflected light. It is more strongly reflected in the plane of the page, but because it is only partially polarized, the azimuthal effect is less.

From R.W. Ditchburn, *Light* (1963), Interscience Publishing, Inc., by permission of John Wiley & Sons, Inc.

Figure 6: *Malus' experiment.* Successive reflections at two unsilvered mirror surfaces, G_1 and G_2 (see text).

The above experiments do not show whether or not the reflected light has its displacement in the plane of reflection or perpendicular to it. It is a matter of choice whether the reflected light is said to be polarized in or perpendicular to the plane of reflection. Some controversy (and some

difference of nomenclature) that formerly led to confusion was removed by the electromagnetic theory (see below). In this theory light is represented by two vectors (quantities that can be represented graphically by arrows that point in the field directions), a magnetic vector in the plane of reflection and an electric vector perpendicular to it. Confusion is avoided by specifying the plane of the electric vector instead of speaking of the plane of polarization.

The azimuthal property of reflected light at the surface of any medium—glass, plastic, a liquid—is most strongly manifested when the angle of incidence is so chosen that its tangent is equal to the index of refraction; that is, it satisfies Brewster's law (after Sir David Brewster, a British physicist), which states that, at the polarizing angle, the incident and refracted beams make an angle of 90° with one another; $\tan \theta_i = n$, in which θ_i is the angle of incidence, called the polarizing angle, and n is the index of refraction of the medium. Nevertheless, there is some azimuthal difference after reflection at any angle except $\theta_i = 0$ or $\theta_i = 90°$. Other ways of producing polarized light are described in a later section.

It is found that the plane of polarization of a beam of polarized light is rotated when the beam is passed through certain mediums (especially sugar solutions). These mediums are said to be optically active. Most mediums do not normally rotate the plane of polarization, but do so when there is a magnetic field in the direction of propagation (the Faraday effect).

Optical activity

The wave equation. The expression for a plane wave, given in equation (1) and showing the relationship between displacement (ξ), the time span (t), and distance (z) along the wave, may be differentiated twice with respect to t and z; that is, to find out how the displacement changes with position and time. This operation yields the partial differential equation:

$$\frac{\partial^2 \xi}{\partial z^2} = \frac{1}{b^2} \cdot \frac{\partial^2 \xi}{\partial t^2}, \tag{7a}$$

in which b is the phase velocity. For a three-dimensional wave the analogous expression is

$$\frac{\partial^2 \xi}{\partial z^2} + \frac{\partial^2 \xi}{\partial y^2} + \frac{\partial^2 \xi}{\partial x^2} = \frac{1}{b^2} \cdot \frac{\partial^2 \xi}{\partial t^2}. \tag{7b}$$

There are many solutions of this basic equation. Some correspond to the sinusoidal plane waves, which have already been considered. Others correspond to groups of plane waves that differ slightly either in direction, or wavelength, or both. Yet another solution of the general wave equation is:

$$\xi = \frac{A}{r} \cos 2\pi(\nu_i t - \nu_i r), \tag{8}$$

in which r is the magnitude of a radius vector drawn from the origin and A is a constant. This represents spherical waves.

Energy of a beam of light. The energy in a small volume (dV), through which plane waves are passing, is proportional to the product of the square of the amplitude (A), or its energy per unit volume (W), and the small volume; that is, $A^2 dV = W dV$. The rate of transport of energy across a surface normal to the direction of propagation is proportional to the product of the energy per unit volume, the phase velocity, and a small area (dS) normal to the direction of propagation, or $Wb\,dS$. For spherical waves, the rate of transport is inversely proportional to r^2, *i.e.*, $(A/r^2)dS$. Because the area of a sphere is $4\pi r^2$ in which r is its radius, this equation implies that the total energy crossing any sphere surrounding a point source is independent of the radius. Thus, inverse-square law for the intensity of radiation at a distance r from a point source is in accord with the law of conservation of energy—the total energy of a wave remains the same even though the wave is spread over a greater area.

Doppler–Fizeau effect. The length of a wave train emitted in one second by a stationary light source is equal to the velocity of light (c) times one second, which in itself is equal to the product of its frequency (ν_i) times its wavelength (λ)—*i.e.*, $c = \nu_i \lambda$. If the source moves away from the observer with a velocity (v) that is small compared with the velocity of light, then the length of the wave train increases so as to be numerically equal to the sum of the two velocities ($c + v$) and the number of waves remains the same. The wavelength λ increases to λ' by a factor $(c + v)/c$; that is $\lambda' = (1 + v/c)\lambda$. This change was discovered by an Austrian physicist, Christian Doppler, in the 19th century in relation to sound waves and subsequently applied to light waves by Fizeau. It is called the Doppler–Fizeau effect. The Doppler–Fizeau effect is easily observed when part of the light from a gas laser is allowed to be scattered by a moving body and mixed with a little unscattered light. It is known from the study of sound waves that the beat frequency is equal to the difference between the frequencies of the two waves that are mixed. Although the frequency of light waves is extremely high (more than 10^{14} per second), the beat frequency may be a megahertz (10^6 cycles per second), which is easily detected by radio amplifiers, or even a few hundred cycles per second, which the human ear can detect. Thus, just as interference fringes provide a periodic phenomenon in which two light waves combine to produce fringes of low spatial frequency, so the Doppler–Fizeau effect produces beats the temporal frequency of which is a known, but very small, fraction of the temporal frequency of the light waves. In this way the periodicity of light in both space and time is exhibited and measured.

Beat frequency

LIGHT SPECTRUM

It was seen, in the preceding section, that white light can be dispersed into a spectrum by refraction, by diffraction, or by interference. Newton showed that if a suitably oriented slit is used to select a small region of the spectrum, the light that passes through the slit is much more homogeneous than the original white light, and he was unable to observe any further dispersion when passing this light through a second prism. Delicate methods of interferometry nevertheless show that this light is never entirely of one wavelength, however fine the slit, but covers a range ($\Delta\lambda$) of wavelengths. The ratio of the wavelength divided by this range, which measures the purity of the spectrum, may be a few thousand for a spectrum formed by a prism and up to a million for a spectrum formed by a large diffraction grating. It is never infinite, as it would be if $\Delta\lambda$ were zero.

The spectrum of a hot body such as the solar photosphere is continuous (every wavelength is represented); but a German physicist, Joseph von Fraunhofer, early in the 19th century observed that the solar spectrum contains numerous dark lines appearing at certain wavelengths, which are attributed to wavelengths originally emitted by inner layers of the Sun but then absorbed by various elements (in gaseous form) in the cooler outer layers (see Plate). Emission spectra produced by electric sparks and arcs contain sharp bright lines which are characteristic of the elements in the electrodes.

In monochromatic light, colour and wavelength are associated. Nevertheless, as Newton said, "the rays, to speak properly, are not coloured." Colour is a sensation in the human mind. Light of one wavelength can stimulate the visual system so that a certain colour sensation (*e.g.*, red) is produced. The way in which the visual system analyzes colour is entirely different from the way in which physical instruments form a spectrum (see SENSORY RECEPTION).

There are a number of ways in which spectra are produced in nature. The rainbow is the most striking of these. The primary rainbow is formed by reflection and refraction of light in raindrops. The rays emerging from the drops are spread out, but for any given wavelength there is a minimum angle of deviation and there is a concentration of energy at this angle. For green light the minimum angle of deviation is about 138° and an observer with his back to the Sun sees the bow at an angle of 42° to the direction of the Sun's rays. Because of the dispersion of water, the angles for different wavelengths are not exactly the same, and the red is seen on the outside and blue on the inside of the bow. A weaker rainbow is formed by

Primary and secondary rainbows

rays that have been twice reflected. In this the colours are reversed. Still weaker supernumerary bows are caused by diffraction in droplets. A rainbow may be regarded as a spectrum of the Sun, but the purity is low.

VELOCITY OF LIGHT

The accepted value of the velocity of light (c) in vacuum is 299,792.458 kilometres per second (see Table 1). The velocity is the same for all wavelengths over the whole range of the electromagnetic spectrum from radio waves to gamma rays. Methods of measurement are of three types: (1) measurement of the time (T) in which a group of waves covers a known distance (l), (2) measurement of the frequency (ν) and wavelength (λ) of monochromatic waves, and (3) indirect methods, such as measurement of the change of frequency or wavelength (Doppler–Fizeau effect) when a beam of light is reflected from a mirror moving with a known velocity.

Table 1: The Constant c
(in kilometres per second)

	year	value
Derived from measurements of the velocity of light		
Michelson	1927	299,796 ± 4
Michelson, Pearson and Pease	1935	299,774 ± 11
Value accepted in 1941	1941	299,773 ± 3
Bergstrand	1951	299,793.1 ± 0.2
Bergstrand (mean value)	1957	299,792.9 ± 0.2
Value adopted by 17th General Congress on Weights and Measures	1983	299,792.458
Derived from measurements on radio waves		
Essen (10^4 MHz)	1950	299,792.5 ± 1
Froome (2.4 and 7.5×10^4 MHz)	1951–58	299,792.5 ± 0.1
Value adopted by 12th General Assembly of the Radio-Scientific Union	1957	299,792.5 ± 0.4
Derived from electrical measurements		
Rosa and Dorsey (ratio of units)	1907	299,788 ± 30
Mercier (Lecher wires)	1923	299,795 ± 30

Methods of type (3) have, so far, given an accuracy of only a few percent. Methods of type (2) cannot be used for light waves because the frequency is about 1.5×10^{14} hertz and is too high to be measured directly. The remainder of this section will review measurements of the velocity of light by methods of type (1) and compare the results of the best measurements with the results obtained for radio waves by methods (1) and (2).

Astronomical measurements. In 1676 Rømer made careful measurements of the times at which satellites of Jupiter were eclipsed by the planet. The times observed did not agree with those calculated on the assumptions of a constant period of rotation and of instantaneous transmission of light. Starting at a time when the Earth was at its nearest to Jupiter, the apparent period increased and the eclipses became increasingly later than the calculated times as the Earth receded from Jupiter. Similarly, the period shortened when the Earth was moving toward Jupiter. The observed times were consistent with a finite velocity of light such that the time for it to transverse the Earth's orbit is about 1,000 seconds. Taken with modern values of the size of the Earth's orbit, the derived value of the velocity is 298,000 kilometres per second. It is remarkable that this first measurement was even of the correct order; the most important conclusion was that the velocity of light is finite. An English astronomer, James Bradley (died 1762), obtained a similar value by the so-called aberration method, based on the apparent motion of stars as the Earth travels in its orbit about the Sun.

Early terrestrial experiments. In terrestrial experiments by method (1), the beam of light is periodically marked either by interrupting it at regular intervals or by modulating it (alternately increasing and decreasing its intensity). The marked beam is transmitted to a distant mirror and the return beam passes through the apparatus that interrupts or modulates the outgoing beam and then to a detector. If the time required for transmission to the distant mirror and return is $1/2$, $3/2$, $5/2$, . . . times the period of the interrupter (or modulator), then the amount that reaches the detector is small. It is usual to adjust either the path length or the period of the interrupter or modulator until the light registered by the detector is a minimum. In the earlier experiments, a mechanical chopper was used as interrupter, and the eye was the detector. Later experimenters used electronic modulators and photoelectric detectors.

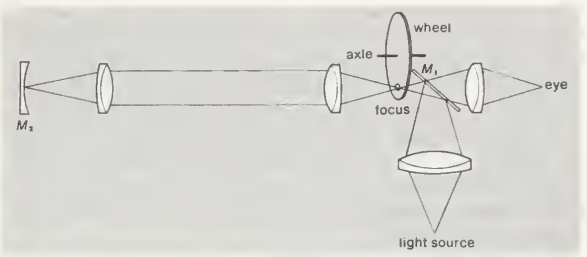

Figure 7: Fizeau's method for measuring the velocity of light.
From R.W. Ditchburn, *Light* (1963), Interscience Publishing, Inc., by permission of John Wiley & Sons, Inc.

The apparatus used by Fizeau in 1849 is shown in Figure 7, in which M_1 is a partially reflecting mirror and M_2 is a fully silvered mirror. As the speed of the wheel (which has 720 teeth) was increased from zero, it was found that the light was first eclipsed by a tooth when the speed was about 12.6 revolutions per second—*i.e.*, when the time to make the round trip was 560 microseconds (0.00056 second), the length of the double path being 17.3 kilometres (about 10 miles). The chief error in the measurement lay in the difficulty of determining the exact speeds at which the light received by the eye at E was at a minimum. Essentially the same method was used by others between 1874 and 1903. The accuracy gradually improved, and it was shown that the velocity is between 299,000 and 301,000 kilometres per second.

In 1834 Sir Charles Wheatstone of England suggested a method incorporating a rotating mirror for interrupting the light that was later developed by Arago (1838) and Foucault (1850). It was considerably improved by Michelson, who made measurements from 1879 to 1935.

Use of a rotating mirror

Michelson's measurements. Figure 8 shows the arrangement used in 1927. The mirror M_3 is a little above the plane of the diagram, and M_3' is a little below. Light from the source S passes to one face of the octagonal mirror M_1 and then to M_2, M_3, and M_4. From M_4 it goes to the mirror M_5 at a distance of about 35 kilometres (about 22 miles). It returns via M_6, M_4, M_3', and M' to the octagon. An image of S is seen in an eyepiece at E. The octagonal mirror rotated at 528 revolutions per second. It turned through approximately one-eighth of a revolution during the transit of the light. If the rotation were exactly one-eighth of a revolution, the image would be undisplaced from the position it had when the mirrors were stationary. In some of Michelson's experiments, the speed of rotation was slowly changed until this condition was obtained. In others, the speed and distance were fixed, and a small displacement of the image was measured.

It is difficult to estimate the accuracy of Michelson's 1927 and 1935 experiments, and it is no longer important to do so in view of the more accurate measurements made since 1945. His most important contribution to the measurement of the velocity was the proof that the velocity agreed with Maxwell's prediction to better than one part in a thousand. This gave confidence to those working on applications of the electromagnetic theory.

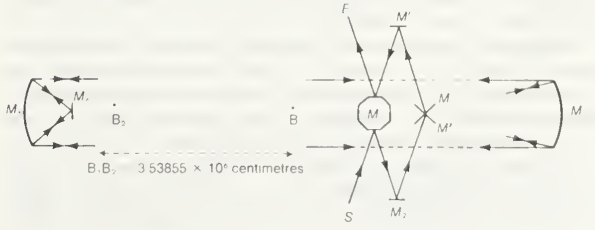

Figure 8: Michelson's Mount Wilson experiment, 1927.

The electro-optical shutter. This device, based on the Kerr effect (see below), makes it possible to modulate a beam of light at frequencies more than 10,000 times the highest frequency of interruption used by Michelson and obtain values in reasonably good agreement with each other and with Michelson's later work. This method was greatly improved by E. Bergstrand in Sweden, who reduced the random errors by a factor of more than 30 and obtained a value for the velocity of light of 299,793.1 kilometres per second.

Radio-frequency measurements. The velocity of electromagnetic waves of radio frequency in vacuum has been measured by several methods. An English physicist, Louis Essen, measured (1950) the resonance frequency of a cavity resonator (an electromagnetic device) whose dimensions were also determined with high accuracy. Keith Davy Froome, a physicist in England, measured (1952 and 1958) the wavelength in air, corresponding to a known frequency, using a microwave interferometer. The results of these and other measurements are in agreement with those of Bergstrand to within a few parts per million. The velocity of radio waves in vacuum is thus equal, within this accuracy, to the velocity of light. The velocity of gamma rays is also the same, within the much lower accuracy of this last measurement. Table 1 summarizes the measurements of the velocity constant (c) and shows that there is now satisfactory agreement between results obtained over a wide range of conditions.

Recognition of the velocity of light as a fundamental constant

Since the publication of the special theory of relativity (1905), the constant c has been recognized as one of the fundamental constants of modern physics. For this reason, attempts will undoubtedly be made to measure it with even greater precision. The use of lasers may help, but a major improvement will require the establishment of better standards of length and time than those now available.

Velocity in material mediums. All measurements of the velocity of light involve interruption or modulation of a beam of light so as to form groups of waves and the velocity measured is the group velocity. The difference in magnitude between the wave velocity and the group velocity of light in air is only about one part in 50,000, but in most glasses and in some liquids it is much larger. Michelson obtained 1.758 for the ratio of the velocity in air to the velocity in carbon disulfide. The inverse ratio of their indices of refraction is 1.64 and the value calculated from this for the ratio of group velocities is 1.745 for wavelength 580 nanometres, close to Michelson's observations. Bergstrand found that the ratio of the velocity *in vacuo* to the velocity in a certain glass was 1.550 ± 0.003. The refractive index of the glass was 1.519, but the ratio of c to the group velocity was 1.547. The experimental results thus agree with those calculated on the assumption that the measured velocity is the group velocity.

Interference and diffraction phenomena

INTERFERENCE

Quasi-monochromatic waves. A perfectly monochromatic wave, represented by equation (1), has constant amplitude and is not limited in space or in time. Sources of light (other than lasers) emit waves the amplitude of which varies with time. For example, a single undisturbed atom emits a damped wave (Figure 14A). Under favourable conditions the damping is so weak that 10^7 waves are emitted before the amplitude has fallen to half its initial value and the change of amplitude is not significant over a distance of several thousand wavelengths. Wave trains of this type are said to be quasi-monochromatic. Superposition of these waves gives interference when the path difference is not too large.

Photometric summation. Figure 5, curve A, shows the way in which the intensity of light varies from place to place when two monochromatic or quasi-monochromatic waves overlap. The intensity at a point in the region where the waves overlap may be expressed as the sum of two terms: (1) the sum of the intensities of each wave acting alone ($2I_0$ if each alone would give intensity I_0); (2) a term representing the interference of the waves. The second term varies from point to point along the direction of propagation between the values $-2I_0$ and $+2I_0$. Thus the total intensity varies from $4I_0$ (*i.e.*, twice the intensity sum) to zero. Now, when a large number of waves from different sources cross a certain space, the fringes caused by the interference of each pair of waves have their maxima in different places and the overall result is that, at any point, the interference terms are positive nearly as often as they are negative and their total sum is nearly zero. In this case the resultant intensity at any point caused by a number of sources is just equal to the sum of the intensities (at that point) of each source acting alone. This is the law of photometric summation and is used by illumination engineers in calculating the illumination on a surface that receives light from various sources. Interference fringes are obtained only when experimental conditions are such that the interference fringes caused by light emitted from different atoms all have their maxima in the same places (or near to the same places). The interference term then becomes a significant fraction of the summation term. This may be achieved either (1) by using two secondary sources (such as the two slits used in Young's interference experiment), which are both derived from the same primary source, or (2) by using a laser in which the source atoms are stimulated in such a way that the phase relations between them remain constant during the period of observation.

Visibility of interference fringes. The distribution of intensity in interference fringes, shown in Figure 5, curve A, represents an ideal that is closely approached in some experiments, but generally the distribution is such that the fluctuations that constitute the fringes are superposed upon a nearly uniform background. Michelson defined the visibility of fringes as the difference between the maximum and minimum intensity of a fringe divided by their sum, or

$$V = \frac{I_{max} - I_{min}}{I_{max} + I_{min}}, \qquad (9)$$

in which V is the visibility, I_{max} is the maximum intensity, and I_{min} is the minimum. The fringe visibility is thus always between zero and one. When the minimum intensity is zero, the visibility equals one. Obviously, fringes for which V is less than one are obtained when waves of unequal amplitude are superposed because the weaker cannot, at any point, annul the stronger. It is also found, however, that even when the intensities are equal, the visibility is usually less than one (as shown in Figure 5, curve B). Further consideration of Young's slit experiment leads to recognition of two conditions that must be fulfilled to obtain fringes of high visibility. These relate to their geometrical condition and spectral range.

Two conditions for high visibility

Geometrical conditions. In the arrangement shown in Figure 4, the centre of the fringe system is at a position O on the screen, on the straight line from the source slit S to a position midway between P_1 and P_2 (the slits are all assumed to be extremely narrow). If slit S is moved to S' then the centre moves to O'. If, instead of moving the slit S to this new position, it is gradually widened, the intensity at any point Q is found by adding the intensities of waves emitted by atoms behind different parts of the slit. Because the fringes on plane $O'OQ$ produced by light from different parts of slit S are not in register, there cannot be zero intensity at any point in the pattern. As slit S is widened the fringes gradually become blurred—*i.e.*, the visibility falls from unity to zero. If $l_1 = l_2$, no fringes are seen when the width of slit S is about equal to the distance (d_f) between successive fringes.

Spectral range. In the case in which the slit S is extremely narrow and the light is not all of exactly one wavelength, the path difference and the phase difference will be zero at the centre of the fringe system for all wavelengths, so that for all wavelengths there is maximum intensity at the centre O of the fringe system. Because the separation of the fringes is proportional to the wavelength, the fringes produced by light of different wavelengths gradually go out of register as the path difference is increased. With white light, one clear fringe is seen in the centre. A few coloured fringes are seen on either side because the

eye makes a certain degree of separation of the colours. If a filter is used to restrict the light to a band of say 50 nanometres wide, then about ten fringes may be seen on either side, and this number is increased if the wavelength range is further restricted.

These two causes of reduced visibility differ in that the geometrical condition affects all parts of the fringe system equally and the effect of the spectral range increases as the path difference increases. In discussing these phenomena it has been assumed, in accordance with the preceding discussion, that the intensity of light from different atoms obeys the law of photometric summation. It is also assumed that the photometric law applies when different wavelengths are superposed.

Coherence. When two beams of light can interact so as to produce interference fringes the visibility of which is unity, they are said to be perfectly coherent. When their interaction produces no fringes (but only photometric summation) they are said to be noncoherent or incoherent. An elaborate mathematical theory of coherence recognizes that coherence and noncoherence are extreme cases—between them lies "partial coherence." Zernike, who contributed a great deal to the development of the subject, defined the degree of coherence γ_{12} of two sources as equal to the visibility of the fringes obtained in the most favourable circumstances using light from these sources. It has been shown that the visibility of the fringes obtained in Young's experiment depends on the width of the slit S_1, and the following mathematical relation has been derived:

Partial coherence

$$\gamma_{12} = \frac{\sin(2\pi ad/l_1)}{2\pi ad/l_1}, \qquad (10)$$

in which d is the width of the slit S_1 (Figure 4). If d is gradually increased from zero, γ_{12} falls from one (for d equal to zero) to zero for $d = l_1\lambda/a$, a value equal to the separation of the fringes when $l_1 = l_2$. When the width d is further increased, fringes are again seen but they are of low visibility and are reversed (*i.e.*, there is now a dark fringe in the centre).

For the case of a slit source being inaccessible for measurement, its angular width (d/l_1) can be determined by measuring the visibility of the fringes while a, the separation between P_1 and P_2, is varied. Michelson used this method to obtain the angular diameter d of a star (serving as the slit source) from measurements of the visibility of interference fringes formed in the focal plane of a telescope that receives light from two small mirrors mounted in front of the telescope's objective, separated from each other by a distance a.

Coherence length

The concept of coherence that has been applied to light from two pinholes may be extended to a beam of light considered as a whole. A roughly parallel beam of light is incident on a thin sheet of metal normal to the direction of propagation. Then two pinholes may be made in the sheet at A and B (Figure 9) and the visibility of the resulting fringes measured so as to obtain the mutual coherence γ_{AB}. If A and B are initially coincident and are slowly separated then γ_{AB} falls gradually from one to zero. It is possible to define a region of coherence around any point A such that if point B lies within this region the coherence is good ($\gamma_{AB} > 0.7$). Similarly, by devices such as that described in the next section it is possible to measure the mutual coherence between A and a point A' that is, as it were, downstream from A and to define a "coherence length" l_c such that coherence is good when $AA' < l_c$. When, (1) the region of coherence extends across the whole beam of light, and (2) the coherence length is large, the beam is said to be highly coherent because the mutual coherence between any two points such as B and A' is high. What qualifies as a "large coherence length" depends on the type of source and the conditions of the experiment; ten centimetres is a large coherence length for the kind of source considered in the next section, but a well-stabilized gas laser may give a beam with a coherence length of many metres.

In the wave equation for light already cited, the displacement and phase angle, represented by the variables ξ and ω, were used to specify a wave motion, but, for light, these

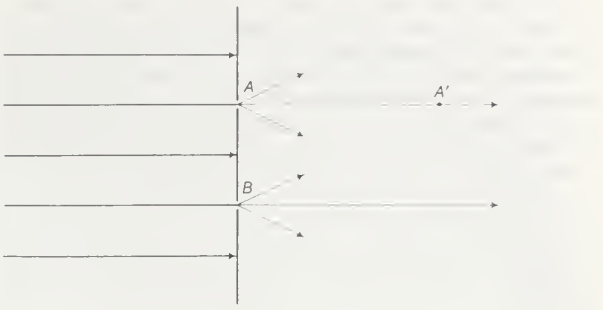

Figure 9: Two pinholes in an opaque sheet to illustrate mutual coherence between points *A*, *A'*, and *B*.

quantities are not observable nor can they be inferred from any observations—because of the high frequency of the wave motion. The coherence γ_{12} and the phase difference, however, are observable quantities that characterize sources and beams of light. This makes them important both in theory and in practice.

Two-beam interference. In the Michelson interferometer, shown in Figure 10, the incident wave W is divided at the beam splitter BS so that part of the light is transmitted and part is reflected. After reflection at M_1 and M_2 the two parts form the wave fronts W_1 and W_2. These are copies of W, and, because corresponding points are superposed, coherence is obtained even with an extended source. The light from source S, selected by the filter at FF', is quasi-monochromatic. The plane R represents the image of M_2 that would be seen by reflection in BS. The phase differences between W_1 and W_2 are the same as if W_2 had been reflected from R, which is called the reference plane. M_1 may be traversed normal to itself and may also be tilted with respect to the reference plane. A compensating glass plate C having the same thickness as BS is used so that both wave fronts will pass through a total of three thicknesses of glass.

Fringes will be formed when M_1 is adjusted to be exactly parallel to R and separated from R by a small distance e. For a hollow cone of rays, each ray will be incident on M_1 and on R at an angle θ. After passing through the instrument on their return trip, these rays will be focussed into a circular ring in focal plane FF' of the lens L. At each point on this ring two waves will be superposed and their path difference will be $2e \cos\theta$. Bright rings are obtained for values of θ such that $2e \cos\theta = p\lambda$, in which p is an

From R.W. Ditchburn, *Light* (1963), Interscience Publishing Inc. by permission of John Wiley & Sons, Inc.

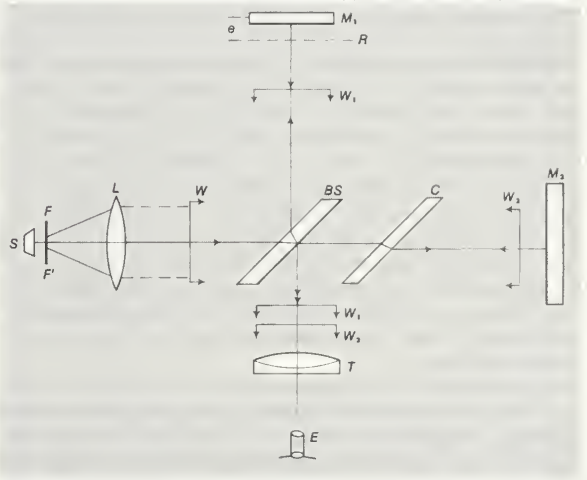

Figure 10: The Michelson interferometer.

integer. The appearance of these fringes is similar to that of Newton's rings (see Plate).

These fringes are known as fringes of equal inclination because any one ring corresponds to a set of rays that all have the same inclination, θ, to the mirror M_1. They are conveniently observed by focussing an eyepiece E on the plane F. Because the lens T and the eyepiece E constitute a telescope focussed for an infinite distance, the fringes are said to be localized at infinity.

The apparatus may also be adjusted so that the mirror M_1 is inclined to R, the image plane of mirror M_2, and nearly in coincidence with it. The incident light is rendered nearly parallel and normal to plane R. If the telescope is removed, straight-line fringes can be seen by an observer who focusses on the region between M_1 and R. A bright fringe is the locus of points for which $2l_p = p\lambda$. These fringes are called fringes of equal thickness.

Fringes of equal thickness may be formed by reflection at the two glass surfaces bounding an air film between two glass plates (Figure 11). Strictly speaking, this arrangement does not give two-beam interference because multiple reflections occur, as shown in the figure. Only the two beams A and B, however, need be considered for present purposes. Beams like B' and C', caused by multiple reflections, are weak, and, unless the glass plates are fairly thin and of high optical quality, fringes formed by beams reflected from the outer surfaces of the glass plates are close together and are of poor visibility. If the arrangement is such that one of the plates is truly planar and that

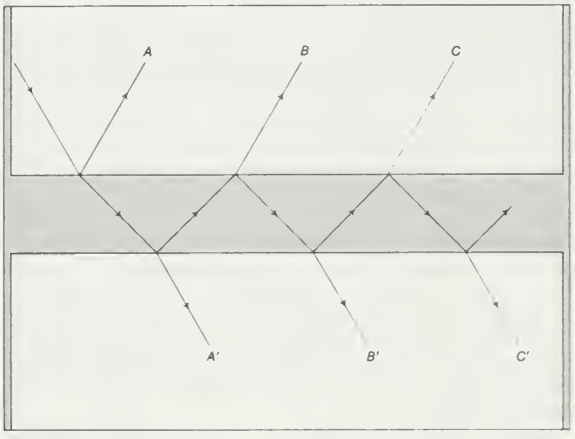

Figure 11: Interference in a thin film of air between two pieces of glass. The rays A, B, C, etc. interfere with each other, as do rays A', B', C', etc.

the other is spherical, as is the case for a convex lens lying on a glass plate, the resulting fringes of equal thickness are circles centred at the point of contact. They are known as Newton's rings (see Plate). In this situation, in which one surface is plane and the other is not, the fringes form a contour map of the nonplanar surface. They are then called contour fringes. This is a useful method for testing the flatness of a surface and determining the location of irregularities.

Newton's rings

Multiple-beam interference. If the two inner surfaces of the plates shown in Figure 11 are coated so as to make them reflect 80 percent or more of the incident light, then the resulting interference pattern will be caused by the superposition of many beams. Figure 12 shows an arrangement for producing the fringes of constant inclination by multiple-beam interference. The amplitudes of successive beams are proportional to r, r^2, r^3, etc. (r is the ratio of the intensity of the reflected light to that of the incident light for one reflection). The phase differences are ε, 2ε, 3ε, etc., in which $\varepsilon = (4\pi e \cos\theta)/\lambda$. These fringes are much sharper than those obtained with two-beam interference (see Plate).

With a large number of beams the intensity is extremely high when they are all in phase ($\varepsilon = 0$), but, even when the phase difference between any two successive beams (*e.g.*, the first and the second) is quite small, the phase difference between the first and, say, the thirtieth beam is so large that the later beams in the series are in opposition to the earlier beams. Thus the intensity is relatively small except when the value of ε is close to one of the values $2p\pi$ (in which p is an integer). Multiple-beam fringes of constant inclination were used by Charles Fabry and Alfred Pérot in France for resolution of spectral lines having only small differences of wavelength. Multiple-beam fringes of constant thickness have been used by an English physicist, Samuel Tolansky, to detect surface irregularities down to less than a nanometre.

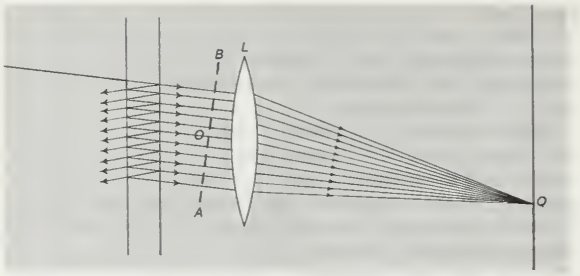

Figure 12: Multiple-beam interference. Lens L concentrates all beams at focus Q with the same phase differences they had while crossing a plane AB normal to OQ.

Wave groups. If two pendulums that have frequencies ν_t per minute and $(\nu_t + 1)$ per minute are started together, they will gradually go out of step; after half a minute they will be moving in opposite directions and after a minute they will be together again. Over a long time they will move together once every minute. In a similar way, when two waves of slightly different frequency are moving in the same direction, they are sometimes in phase and sometimes out of phase so that the resultant is sometimes large and sometimes small, as shown in Figure 13. Two waves may be considered for which the spatial frequencies are ν_s and $(\nu_s + \Delta\nu_s)$ and temporal frequencies ν_t and $(\nu_t + \Delta\nu_t)$. The fluctuation represented by the envelope (dotted line in Figure 13) is called the beat wave. It has a temporal frequency $(\Delta\nu_t)$ equal to the difference of the temporal frequencies of the constituent waves and a spatial frequency $(\Delta\nu_s)$ equal to the difference of the spatial frequencies. It is therefore propagated with a velocity $U = \Delta\nu_t/\Delta\nu_s$. Many physical problems involve groups of waves that include a range of frequencies. It is found that, even in a dispersive medium, a group is propagated over a considerable distance as a recognizable unit. The velocity of this recognizable group is $U = d\nu_t/d\nu_s$.

Velocity of groups of waves

From R.W. Ditchburn, *Light* (1963), Interscience Publishing, Inc. by permission of John Wiley & Sons, Inc

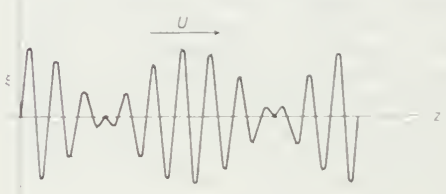

Figure 13: A simple beat wave of amplitude ξ moving with velocity U (see text).

There is a certain kind of wave group for which the variation of the displacement with distance (z) along the path of propagation may be represented by the expression $h(z) \cos \nu_0 z$, in which $h(z)$ is a function that varies with z much more slowly than $\cos \nu_0 z$; *e.g.*, in Figure 13, $h(z)$ would be the function represented by the dotted line, and ν_0 is the spatial frequency of the individual waves represented by the full line. These waves are called modulated waves. If $h(z)$ varies extremely slowly with z, the modulated wave is quasi-monochromatic in the sense described above; *i.e.*, it departs little (over distances long enough to contain many wavelengths) from a monochromatic wave. A modulated wave is completely described when $h(z)$ and ν_0 are known. It is also completely described when the amplitudes and phases of the various waves that make up the group are known. These are given by a function α dependent on the frequency ν_s, $\alpha(\nu_s)$. Because $h(z)$ and $\alpha(\nu_s)$ both describe the same wave group, there must be a relation between them. A mathematical theorem of a French mathematician, Jean-Baptiste-Joseph Fourier, gives this relation, making it possible to calculate either $h(z)$ or $\alpha(\nu_s)$ when the other is known. The energy density at z is equal to $W(z)$, which is proportional to $[h(z)]^2$. The energy per unit frequency range near ν_s is $G(\nu_s)$, which is proportional to $[\alpha(\nu_s)]^2$.

When $h(z)$ varies very slowly with z, $\alpha(\nu_s)$, and thus $G(\nu_s)$, is large for a range of ν_s close to ν_0 and falls rapidly to near zero outside this range, as shown in Figure 14B. If this range in which $G(\nu_s)$ is large is ν_R and if l_R represents a range of z over which $h(z)$ varies very little, then it is found that ν_R and l_R are inversely proportional to one another and that their product is of the order of magnitude of unity. This represents the fact that the longer the wave train the more closely its properties agree with those of the ideal monochromatic wave, which is infinitely long and has a precisely defined frequency.

Undisturbed atoms emit exponentially damped waves the length of which is usually 10^7 waves or more so that ν_R is

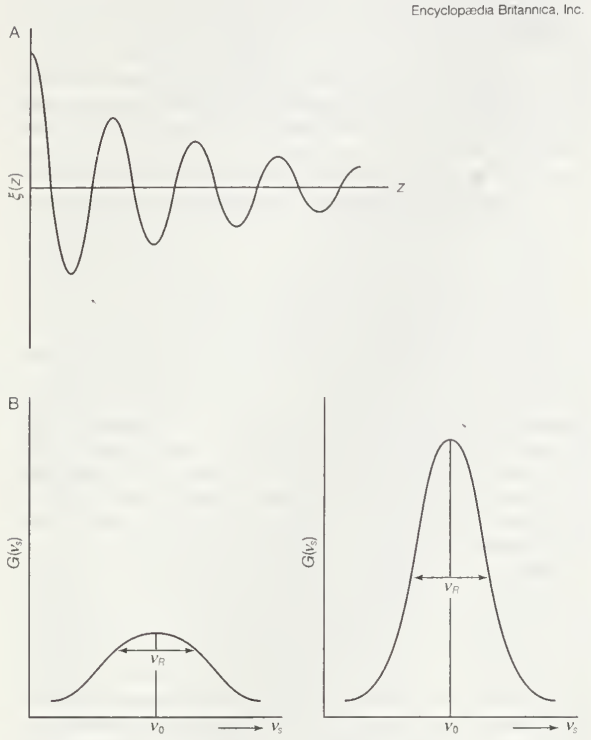

Figure 14: *Damped waves.*
(A) Amplitude, $\xi(z)$, as a function of distance, z. (B) Energy, $G(\nu_s)$, as a function of frequency, ν_s. The figure shows heavy (left) and light (right) damping. For light emitted by free atoms, l_R would encompass 10^7 waves or more and ν_R would be correspondingly smaller (see text).

a small fraction of ν_0. Collisions increase the damping by a factor that is proportional to the pressure. The observed radiation is also modified by the Doppler–Fizeau effect, because the atoms that emit the light do not all have the same velocity. This increases the range $\Delta\nu_R$. Even when the effects of collision damping and Doppler–Fizeau effect are combined, the value of l_R for the wave trains emitted in low-pressure electrical discharges is still about 10^5 wavelengths, and most of the energy is confined within a frequency range of order $10^{-5}\ \nu_0$ (which corresponds to a wavelength range of less than 0.01 nanometre). These quasi-monochromatic waves are called wave groups. The light that is emitted by high-pressure lamps or by luminescent solids extends over a much wider range of frequency, and wave-group theory has little useful application to problems concerning non-monochromatic light from these sources.

Wave groups in a dispersive medium. In vacuum, all components of the group have the same phase velocity, and therefore the phase relations between different members of the group are constant. A group advances as a unit without any change of the modulation function $h(z)$. In a dispersive medium, the phase relations change and $h(z)$ changes as the wave train advances, but this change is slower than might be expected. Over considerable distances the group is propagated as a recognizable whole with the group velocity U. The change of $h(z)$ is small for passage through a gas and also for groups (for which ν_R is small) that represent sharp spectral lines. Thus these wave groups are propagated virtually unchanged through

Propagation of wave groups from stars

an optical instrument or, if they arrive from the Sun or stars, through the Earth's atmosphere.

In Young's experiment, Figure 4, the fringes have maximum visibility at the position O, corresponding to zero path difference and zero phase difference for all wavelengths. If a thin sheet of mica is inserted in front of slit P_1, the centre (or position of maximum visibility) is displaced upward. It was at one time thought that the new centre would be found at the point corresponding to zero phase difference for the mean wavelength in the wave group—*i.e.*, the point calculated for equal times from slits P_1 and P_2, allowing for the fact that the phase velocity in mica is less than that in air. This did not agree with experimental observation. It was found that the new centre is situated at the position where the times from P_1 and P_2 are equal when the group velocity is used to calculate the time required to traverse the piece of mica. At this position the wave train from P_1 exactly overlaps the wave train from P_2. At any other position, part of each wave train cannot take part in the interference because it does not coincide with any part of the other wave train. This light that cannot interfere forms a uniform background and so reduces the visibility of the interference fringes.

If white light is used and a fairly thick piece of mica is inserted, no fringes are obtained. This is because the wave train has changed shape so much in passing through the mica that it can no longer match the wave train that has travelled through air.

Michelson, using the apparatus shown in Figure 10, studied the decrease in visibility of interference fringes as the path difference between the two wave trains is increased. The reduction in visibility as the path difference increases may be assigned either (1) to the fact that the parts of the wave trains that overlap are decreasing or (2) to the increasing difference between the positions of the bright fringes for different wavelengths in the group. As was seen above, the length of the wave trains and the range of the wavelength are inevitably linked, and so these alternatives (1) and (2) do not constitute two different theories. They are just two different ways of visualizing how wave trains (or wave groups) interfere.

DIFFRACTION

Theory of diffraction. Huygens assumed that every point on a wave front may be regarded as a source of spherical wavelets the envelope of which is the position of the wave front at a later time. Huygens was thus able to account for rectilinear propagation and for the laws of reflection and refraction. Fresnel added the hypothesis that the wavelets can interfere, and this led to a theory of diffraction. Figure 15 shows how a coherent, monochromatic wave from a point source P falls on the screen

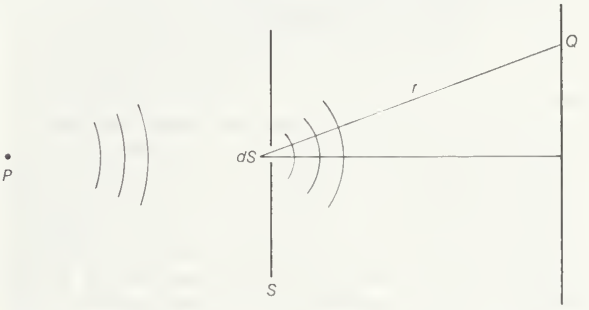

Figure 15: Principle of Fresnel's theory of diffraction (see text).

S, which is opaque except for an aperture dS. Fresnel assumed that the amplitude ($d\xi_Q$) of the wavelet at Q, originating from a small area dS, is:

$$d\xi_Q = \alpha \frac{A}{r} f(\chi) dS, \qquad (11)$$

in which A is the amplitude of the incident wave, α is a constant, r is the distance from dS to Q, and $f(\chi)$ is a function of χ, the inclination factor; this factor was introduced by Fresnel because he believed that the effect of the element dS would be greater in the forward direction

($\chi = 0$) than in an inclined direction. The total effect at Q was obtained by superposing the wavelets from all parts of the aperture, allowing for phase differences caused by a variation of r and also for variation of the inclination factor, $f(\chi)$. Fresnel developed an ingenious method of dividing S into a series of zones of equal area and calculating the total effect as the sum of a simple series. This method applies only to circular apertures and obstacles and then only to points on the axis of symmetry, but Fresnel also developed integrals that are more generally applicable.

Fresnel zones

Fresnel predicted that there should be a bright spot at the centre of the shadow of a circular obstacle. The experimental verification of this unexpected result gave confidence in Fresnel's wave theory of diffraction.

Fraunhofer diffraction. When the source and pattern screen are sufficiently far from the slit, the phase differences corresponding to different parts dS of the slit opening vary linearly with x and y coordinates in the plane of the aperture (Figure 16). This situation is obtained when two spherical lenses L_1 and L_2 are introduced with source P at the focus of L_1 and Q in the focal plane of L_2. Spherical waves emanating at the focus of a lens are rendered plane wherever they encounter the lens. Plane waves are made spherical by a lens. They have the same radius of curvature as the focal length of the lens. The wave falling on S is a plane wave, and the total effect at Q may be regarded as caused by a plane wave leaving S. The same result is obtained if L_1 and L_2 are replaced by a single lens (situated near S) that forms an image of P at Q_0. This

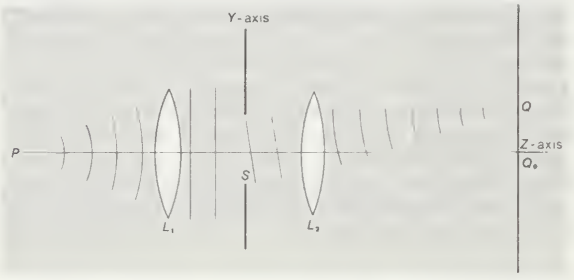

Figure 16: Arrangement for Fraunhofer (far-field) diffraction. The opening at S diffracts light from source P onto plane Q (see text).

is known as far-field diffraction, or Fraunhofer diffraction, and is thus distinguished from near-field, or Fresnel, diffraction. It should be understood, however, that there is only one physical theory of diffraction that is derived from the ideas of Huygens and Fresnel. Fraunhofer diffraction is of great practical importance especially in regard to the performance of optical instruments.

Groups of waves with different directions. When a plane wave is incident upon a slit as shown in Figure 16 (so that its width is limited), the emergent light may be represented by a group of plane waves. All the waves of this group have the same spatial frequency but differ in regard to direction of propagation. It is possible to define a range of angles (in the plane of the page) within which most of the light is found. If this range is θ_R and the width of the slit is w, then it is found that sin θ_R is inversely proportional to w; *i.e.*, the narrower the slit, the greater is the angular spread—sin θ_R is roughly equal to λ/d. Using Fourier's theorem it is possible to derive an equation that gives the amplitude and phase of the light diffracted in any direction as a function of the width of the slit. Extension of the calculation to diffraction by apertures or obstacles of any shape involves more lengthy mathematics but no new physical principle.

Angular power spectrum. The energy diffracted in any direction is proportional to the square of the corresponding amplitude. This energy expressed as a function of the angles that define the direction is called the angular power spectrum. It may be measured and is found to agree with that calculated when the width of the slit (or, more generally, the shape and size of the apertures) is known. There are many problems in which it is desired to carry out an inverse calculation—*i.e.*, to calculate the shape and size of the apertures from measurements of the angular power spectrum. Unfortunately, this is not, in general, possible because measurement of the angular power spectrum does not give the phase of the diffracted light. It is found, however, that measurement of the angular power spectrum yields a function (known as the auto-correlation function) of the size and shape of the obstacles or apertures responsible for the diffraction. In X-ray analysis, this function gives important information about symmetry. A complete picture of the crystal may often be obtained by combining calculations from the angular power spectrum with information derived from other sources.

It is found that when diffraction is due to a number of apertures (or obstacles) that are similar in size, shape, and orientation, the angular power spectrum (G) is the product of two factors, F and f, in which F (called the form factor) depends only on the properties of the individual aperture and f (called the structure factor) depends only on the arrangement or spacing of the elements. When the apertures are irregularly arranged, f is just equal to N (the number of apertures). Thus the diffraction halos produced by an irregular distribution of small similar objects have the same intensity distribution as the pattern for a single particle. This principle is used in a device called an eriometer to determine the size of blood corpuscles and may also be used to calculate the average size of the small particles that cause a halo around the Moon.

When N similar elements are arranged in a regular pattern, the structure factor may vary from zero to N^2. A diffraction grating (a plate having parallel lines engraved across its surface) with N lines is such a pattern, and, for any of the directions θ_p defined by equation (6), the light from all elements (lines) is in phase; the amplitude is N times that given by a single element, and thus the energy and the structure factors are proportional to the total number of lines squared—*i.e.*, $f = N^2$.

Diffraction by similar apertures

Limits of resolution. Diffraction spreads the light in optical images; so that if two objects are too close to each other, the gap between them cannot be distinguished. The distribution of intensity with radius in the image of a point source is shown in Figure 17. Rayleigh showed, theoretically and experimentally, that the images of two point sources are just resolved when their separation is such that the centre of the pattern due to one image falls on the first minimum of the pattern due to the other (Figure 18). This implies that a telescope with a perfect objective of diameter D can just resolve two stars whose angular separation is $1.2\ \lambda/D$. Qualitatively, this agrees with a calculation that shows that most of the energy in the diffraction pattern of an aperture of width d lies within an angular range $\pm\lambda/d$.

The angular separation of the maxima resulting from light

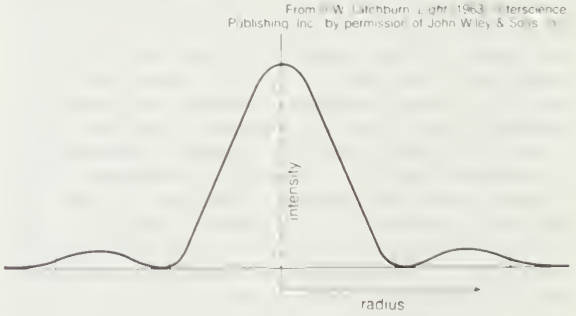

Figure 17 Illumination of a point source image modified by diffraction, shown as the variation of intensity with radius

of two wavelengths λ and $\lambda + \Delta\lambda$ in a spectrum formed by a diffraction grating is obtained by differentiating equation (6), resulting in $\Delta\theta = p\Delta\lambda/e \cos\theta$. These maxima are just resolved if $\Delta\theta = \lambda/M$, in which M is the width of the beam diffracted by the grating. For a grating of N lines, this width is $Ne \cos\theta$, and the resolving power $R = \lambda/\Delta\lambda = pN$. A grating ten inches wide, for example, with 10^4 lines per inch and $p = 10$, has a resolving power $R = 10^6$.

The limit of resolution for a microscope depends on conditions of illumination and is at best about half a wavelength ($\lambda/2$), or about 250 nanometres for visible light.

Polarization and electromagnetic theory

POLARIZED LIGHT

Interference of polarized light

Interaction of plane-polarized beams. Fresnel and Arago, using an apparatus based on Young's experiment (Figure 4), investigated the conditions under which two beams of plane polarized light may produce interference fringes. They found that: (1) two beams polarized in mutually perpendicular planes never yield fringes; (2) two beams polarized in the same plane interfere and produce fringes, under the same conditions as two similar beams of unpolarized light, provided that they are derived from the same beam of polarized light or from the same component of a beam of unpolarized light; (3) two beams of polarized light, derived from perpendicular components of the same beam of unpolarized light and afterwards rotated into the same plane (*e.g.*, by using some device such as an optically active plate) do not interfere under any conditions.

Result (1) is to be expected because two displacements in perpendicular planes cannot annul one another, and result (2) is also easily understood. Result (3) shows that mutually perpendicular components of unpolarized light in a beam are non-coherent. Their phase difference varies in time in an irregular way. Unpolarized light has a randomness, or lack of order, as compared with polarized light (implying an entropy difference). This order (or lack of order), rather than the azimuthal property, is the most fundamental difference between polarized and unpolarized light. Perfectly monochromatic light is perfectly coherent and completely polarized.

Superposition of polarized beams. Two coherent beams of plane polarized light may be thought of as propagated in the Oz direction, one with its vector along Ox and the other with the electric vector along Oy; *i.e.*, the two vibrations are at right angles to each other as well as to the direction of propagation (Figure 19). If the beams have amplitudes a_x and a_y and phases ε_x and ε_y, then, in general, the resultant vibration (R_1, R_2, and R_3) may be represented in magnitude and polarization by a vector, or arrow, the tail of which touches the axis of propagation Oz while the point moves round the ellipse (Figure 19). It goes round once when the phase angle φ (see equation [1]) changes by 2π—*i.e.*, at any given place when t changes by ν or for any one time when z changes by λ. The beam is said to be elliptically polarized. If the phase difference is $\pi/2$, then the axes of the ellipse are equal to a_x and a_y and are along O_x and O_y.

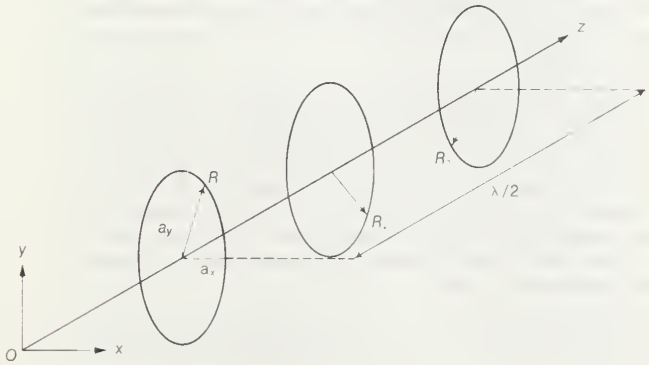

Figure 19: Progression of elliptically polarized wave (see text).

Elliptically polarized light may be regarded as the most general type of polarized light. If the amplitudes of the two waves are equal, $a_x = a_y$, and the phase difference is still $\pi/2$, the ellipse becomes a circle and the light is said to be circularly polarized. If the phase difference ε_{xy} is not equal to $\pi/2$, the resultant is still elliptically polarized light, but the axes of the ellipse no longer coincide with the axes of coordinates. If the phase difference $\varepsilon_{xy} = 0$ or π, the ellipse shrinks to a straight line and the light is said to be plane-polarized. If the representative vector, when viewed by an observer who receives the light, rotates in a clockwise direction, the light is said to be right-handed (or positive) elliptically polarized light. The opposite sense of rotation corresponds to left-handed (or negative) elliptically polarized light.

In the above analysis, elliptically polarized light is regarded as the resultant of two beams plane-polarized in perpendicular planes. Conversely, it is possible to regard plane-polarized light as the resultant of two beams of elliptically (or circularly) polarized light of the same wavelength, provided that the ellipses are similar in orientation and eccentricity, but one beam is right-handed and the other left-handed.

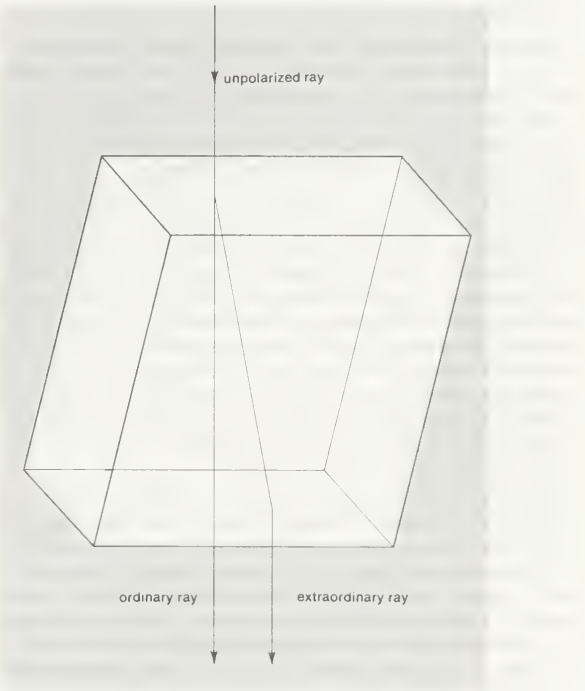

Figure 20: Double refraction showing two rays emerging when a single light ray strikes a calcite crystal at right angles to one face (see text).

Double refraction. In the 17th century Bartholin showed that a ray of unpolarized light incident on a plate of calcite, unlike glass or water, is split into two rays, as shown in Figure 20. One ray, called the ordinary ray, is in the plane containing the incident ray and the normal to the surface. If the angle of incidence is varied, this ray is found to obey Snell's law of sines, equation (3). The other ray, called the extraordinary ray, is not in general coplanar with the incident ray and the normal; also, for it, the ratio of sines is not constant. The fact that Snell's law is not obeyed in certain directions implies that the velocity of light in such a medium, called anisotropic, depends on the direction of travel in it. The two rays are polarized in mutually perpendicular planes. This is known as double refraction, or birefringence.

Birefringence

In order to apply Huygens' method of constructing wave fronts (see above *Theory of diffraction*), it is necessary to assume that, in an anisotropic medium, the wave surface

from a point source consists of two sheets, or surfaces (Figure 21). The observation that one ray obeys both laws of refraction implies that one sheet must be a sphere—like the wave surface in an isotropic medium. Huygens assumed that the other sheet is an ellipsoid of revolution that touches the sphere either internally (Figure 21A) or externally (Figure 21B). There is one velocity of propagation for the direction defined by the line through the two points of contact (called the optic axis) and two velocities for any other direction corresponding to light polarized in two mutually perpendicular planes.

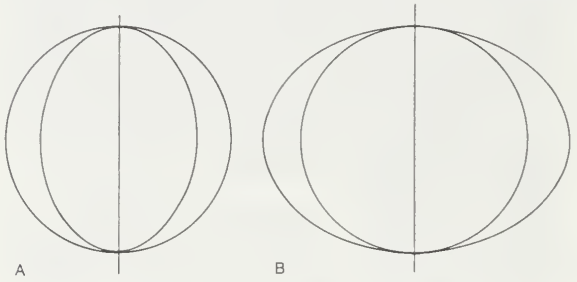

Figure 21: Wave surface for (A) positive and (B) negative uniaxial crystals.

Crystals for which the wave surface has the form shown in Figure 21A are said to be positive uniaxial crystals, and Figure 21B refers in a similar way to negative uniaxial crystals. Huygens thought all crystals were uniaxial, but later observations showed that the general form of the wave surface is more elaborate and is biaxial.

When a parallel beam of plane-polarized light is incident normally upon a thin crystal plate and the crystal is rotated about an axis normal to the plate, two orientations will be found in which a single beam of plane-polarized light emerges; for one orientation, the light is called the ordinary ray, and for the other orientation, the extraordinary ray. Two lines may be drawn on the plate (or on its mount) to indicate the direction of the electric vector of the incident beam when the orientation is such that plane-polarized light emerges. The directions of these lines are called privileged directions for the given anisotropic plate; they are perpendicular to one another.

When light waves pass through an isotropic plate of thickness d, the phase change is $2\pi nd/\lambda$ (n is the index of refraction). For an anisotropic plate there are two indices, n_o and n_e, corresponding to the two privileged orientations, and there are corresponding phase changes, $2\pi n_o d/\lambda$ and $2\pi n_e d/\lambda$. If a beam of light, polarized in some plane other than one of the two privileged orientations, is incident on the plate, it may be resolved into two wave components (lying in two mutually perpendicular planes) that emerge with a phase difference ε_{oe} equal to $2\pi(n_e - n_o)d/\lambda$. The phase difference ε_{oe} is called the retardation of the plate. When the retardation ε_{oe} is equal to $\pm\pi/2$, the plate is called a quarter-wave plate, and when ε_{oe} is equal to $\pm\pi$, it is called a half-wave plate.

The maximum difference of $(n_e - n_o)$ for calcite, a crystal that is strongly birefringent, is about 0.17. Quarter-wave plates are often made by splitting sheets of mica. Inasmuch as the relevant difference of indices is about 0.004, a mica quarter-wave plate is about 60 wavelengths, or 0.03 millimetre thick.

When a parallel beam of plane-polarized light is incident normally on a quarter-wave plate, the emergent light is circularly polarized if the plane of the electric vector bisects the angle between the privileged directions. Otherwise the emergent light is elliptically polarized, the axes of the ellipse being parallel to the privileged directions of the quarter-wave plate. In a similar way, a suitably oriented quarter-wave plate may be used to convert elliptically polarized light to plane-polarized light.

Induced birefringence effects

Many substances that are normally isotropic become weakly birefringent when subjected to shear stress (photoelastic effect; see Plate). Birefringence is also induced by an applied electric field (Kerr effect). A restricted class of crystals that are normally birefringent shows a large change in birefringence when an electric field is applied. Weak birefringence is produced by an applied magnetic field.

Production of polarized light. Unpolarized light may be separated into two components, polarized in perpendicular planes, either (1) by reflection or (2) by refraction. A single reflection at the polarizing angle produces a well-polarized reflected beam of low intensity (*i.e.*, most of the waves are polarized in one plane) and a strong transmitted beam that is only partially polarized. A pile of glass plates provides many surfaces for reflection and thus gives a much stronger reflected beam that is still well polarized; it also considerably improves the degree of polarization of a transmitted beam.

A Nicol prism (Figure 22) is made by cutting a calcite crystal in a suitable plane relative to the crystal axes and cementing the two parts together with Canada balsam. The critical angle for total reflection is less for the ordinary ray than for the extraordinary ray. The crystal is cut at an angle (relative to the crystal axes) such that, for a cone of incident rays of divergence about 24°, the ordinary ray is totally reflected, whereas the extraordinary ray is transmitted. Both rays are almost completely polarized. A prism of this type with air instead of Canada balsam as the separation film was devised by Foucault for polarization of ultraviolet radiation.

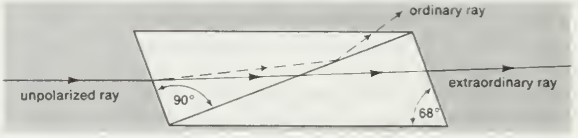

Figure 22: Nicol prism (see text).

Many crystalline substances have different absorption coefficients for the ordinary and extraordinary rays, but the difference is not large enough to provide a useful method of polarization. A series of artificial materials that polarize by absorption has been developed. Complex crystals are produced in a plastic matrix and oriented by stretching. One material of this type, called Polaroid H, transmits about 80 percent of plane-polarized light with the electric vector in one plane and less than 1 percent if the vector is in a perpendicular plane. This type of film offers the most convenient method of obtaining an intense beam of light that is nearly 99 percent plane-polarized.

Analysis of polarized light. Any polarizer has a preferred plane such that if an incident plane-polarized beam has the electric vector in this plane, a high intensity is passed, whereas the device rejects light polarized with the electric vector in a plane perpendicular to the preferred plane. This property implies that any polarizer may be used as an analyzer to test whether or not a given beam of light is plane-polarized. The analyzer is rotated in the beam and if the intensity I of the transmitted light is zero for some orientation, the beam is plane-polarized with the electric vector in a plane perpendicular to that for which the intensity is zero. If there is a position for which the analyzer gives a non-zero minimum, then either (1) the light is elliptically polarized or (2) it is partially polarized. Also if the intensity is not affected by rotating the analyzer, then the light is either (3) unpolarized or (4) circularly polarized. These ambiguities between (1) or (2), and (3) or (4), may be removed and the analysis of a mixture may be completed by using an analyzer and a quarter-wave plate together.

Stokes parameters and Poincaré sphere. Any mixture of different kinds of polarized light may be reduced to an equivalent amount of one kind of polarized light characterized by the orientation and length of axes of an ellipse. It may, of course, happen that the ellipse degenerates to a straight line or a circle. An alternative way of characterizing polarized light is by means of the Stokes parameters, named after a British physicist, George Gabriel Stokes, and defined as follows:

$$S_0 = \langle a_x^2 \rangle + \langle a_y^2 \rangle; \qquad S_1 = \langle a_x^2 \rangle - \langle a_y^2 \rangle;$$
$$S_2 = 2\langle a_x a_y \cos \varepsilon_{xy} \rangle; \qquad S_3 = 2\langle a_x a_y \sin \varepsilon_{xy} \rangle,$$

in which the polarized light is regarded as the resultant

of two beams polarized with vectors a_x and a_y along the coordinates Ox and Oy, and ε_{xy} is the phase difference as in the section above. The brackets $\langle\rangle$ indicate time averages. If the light is completely polarized, then the square of S_0 is equal to the sum of the squares of the other three parameters. This relation was used by a French mathematician, Henri Poincaré, to produce an elegant representation of the properties of polarized light by means of a sphere, which is known as the Poincaré sphere. Each point on the sphere represents a different kind of polarized light; *e.g.*, the two poles represent right- and left-handed circularly polarized light, points on the equator represent plane polarized light; other points on the sphere represent different kinds of elliptically polarized light. The Stokes parameters constitute a matrix representation of polarized light. This kind of representation makes available certain powerful mathematical methods (which have been developed in other connections) for calculating how the state of a beam of polarized light changes on reflection or on passing through a crystal.

Colours of thin plates. When a parallel beam of white light (I_0) is passed through a thin slice of crystal placed between a polarizer and an analyzer, the intensity I of the emergent light may be expressed as the sum of two terms:

$$I = \text{white term} + \text{colour term}.$$

The white term represents the amount of light that would be transmitted if the crystal were not present. It is equal to $I_0 \cos^2 \theta$, in which θ is the angle between the preferred directions of polarizer and analyzer. The colour term depends on the relation between the directions of the crystal axes and the preferred directions of polarizer and analyzer. It is dependent on the retardation ($\varepsilon_{oe} = 2\pi d\,[n_e - n_o]/\lambda$) of the plate as well. Because this retardation varies with the wavelength, the transmission depends on the colour. Some parts of the spectrum are transmitted more than others, and the emergent light is coloured. The first term, on the contrary, does not depend on the properties of the crystal, and it represents white light. It can be reduced to zero by setting the analyzer and polarizer so that their preferred directions are at right angles ($\theta = \pi/2$). The colour is then obtained most strongly, because any transmission of light results from anisotropy (*i.e.*, birefringence) in the slice. This provides a sensitive method of detecting strains in glass and may also be used to detect induced anisotropy when mechanical or electrical stress is applied. This method is sometimes used to detect regions of large strain in beams or girders. A model of the beam is made in plastic and placed between polarizer and analyzer. On applying a load, fringes appear in the regions of most strain. Plate I shows a picture obtained in this way. The example is chosen for simplicity, whereas useful application to more complicated structures requires laborious calculations.

The Kerr shutter

A high-speed optical shutter called the Kerr shutter can be made by placing an isotropic material between crossed polaroids, one acting as a polarizer and the other as an analyzer, and applying an electric field. If a suitable material is used, the intensity of the transmitted light will reproduce the variation of electric field, even at frequencies over a megahertz. An improved shutter is produced by using the change of birefringence in some crystals.

Rings and brushes. The retardation of waves by a crystal plate depends on the relation between the perpendicular to the surface of the plate and the axes of the crystal from which it was cut. Observation of the colours of one plate with parallel light gives information in relation to one direction within the crystal. It is possible to obtain information about many directions within the crystal at one and the same time. This is done by taking the light that has passed through the polarizer and converging it strongly, using a microscope objective (reversed). It then passes through the crystal as a solid cone of light. It is rendered nearly parallel again by a second objective and passes through the analyzer. Finally it passes through an optical system that brings all rays that have passed through the crystal in one direction to a focus at a single point in a certain plane (a similar focussing is shown in Figure 12). Thus each point in this plane corresponds to a certain direction in the crystal and to a single value of retardation ε_{oe}. The differences in retardation ε_{oe} are caused partly by variation of $(n_o - n_e)$ with the direction in the crystal and, usually to a lesser extent, by a difference in the length of path within the crystal. This implies that, with monochromatic light, bright and dark fringes are observed. Each dark fringe is the locus of points for which the retardation is an odd number multiple of 180°—*i.e.*, ε_{0e} equals $p_0\pi$ (p_0 being an odd integer). If the slice is cut from a uniaxial crystal with its normal in the direction of the optic axis, the symmetry of the wave surface (Figure 21) requires that the fringes be circular rings (see Plate). The rings are interrupted at certain points for which the second term (in the expression of the intensity of the light transmitted by a crystal plate placed between polarizer and analyzer) is zero. This gives either a bright cross or a dark cross depending on the angle between the preferred directions of the polarizer and the analyzer; these crosses are known as brushes. The patterns obtained with a slice cut so that the normal is not in the direction of the optic axis (a crystal direction for $n_o = n_e$) or with biaxial crystals are complicated and sometimes beautiful (see Plate). Such patterns may be used to identify crystals present as fairly small inclusions in other materials.

ELECTROMAGNETIC-WAVE CHARACTER OF LIGHT

Maxwell's equations. Historically the theory of electricity and magnetism developed in the form of a number of empirical laws each of which was a generalization based on a series of experiments; *e.g.*, Coulomb's law dealt with the force between two stationary electric charges. Maxwell replaced all these laws by a single theory concisely stated in the form of a set of vector equations. It has been said that Maxwell's theory is Maxwell's equations, and indeed it is impossible to do justice to Maxwell's achievement without use of these equations. The content of these equations and their relevance to the theory of light will be described here in general terms. The reader may refer to standard texts on electromagnetic theory for the equations themselves.

Constitutive and field equations

Electric and magnetic fields are specified by means of the vectors E and H with which are associated the vectors D, B, and J (electric and magnetic induction and density of electric current). Maxwell's equations fall into two groups: (1) three constitutive equations and (2) four field equations.

All material bodies contain electrons. These are negative charges circulating around heavier nuclei that are positively charged. When an electric field is applied to a material body, the average positions of the negative charges relative to the positions of the positive charges are changed. This creates an internal electric field. Similarly the action of a magnetic field on a material changes the movement of the electrons and sets up an internal magnetic field. The constitutive equations state that effects within a material body are proportional to the applied fields so that the resultant fields within the body are proportional to the applied field. Certain constants are defined: ε is the dielectric constant, μ is the magnetic permeability, and σ is the electrical conductivity. There is no general agreement, however, concerning these constants, and therefore some authorities use a different nomenclature (for treatment of the constants in greater detail, see ELECTROMAGNETIC RADIATION and ELECTRICITY AND MAGNETISM). But these are basic properties of the material: for free space the values are ε_0, μ_0, and zero respectively.

The first of the four field equations quantifies certain properties of the electric induction at the boundary of a volume that contains a net positive or negative charge. The second states that, since there are no free magnetic poles, a certain integral of magnetic quantities is zero. The third equation states that, when the magnetic flux through a surface changes, electrical voltages appear on the boundaries of the surface. The fourth states that electrical currents in conducting materials and changes of the electric induction in nonconducting materials produce magnetic effects.

The field equations (like the constitutive equations) are linear equations: they state that certain quantities are proportional to one another; *e.g.*, the third equation states

that the electrical voltages are directly proportional to the rate of change of magnetic flux. No new constants (other than ε, μ, and σ), however, are introduced. In Maxwell's equations, electricity and magnetism are two aspects of one thing called electromagnetism. Maxwell's theory can indeed be stated in a way that does not mention electricity and magnetism separately.

Maxwell's new hypothesis

The three constitutive equations and the first three of the field equations are precise formulations of known empirical laws. In the fourth field equation Maxwell introduced a new hypothesis—that an electrical change in a nonconductor produces magnetic effects. This hypothesis—which can be verified by electrical experiments—leads to the theory of electromagnetic waves capable of being propagated through a vacuum.

Propagations of electromagnetic waves. When Maxwell's equations are combined, using standard mathematical methods, a new equation is obtained. This is similar in form to the wave equation (7) given above. It predicts the existence of electromagnetic waves, with well-defined properties which will now be described.

1. In free space (*vacuo*) electromagnetic waves are propagated with a phase velocity $c = (\varepsilon_0\mu_0)^{-1/2}$; the magnitude of c obtained from electrical measurements of $\varepsilon_0\mu_0$ is approximately equal to the measured velocity of light (see Table 1). Plane waves are propagated without attenuation. Spherical waves have an amplitude inversely proportional to the distance from a small source.

2. For transparent nonconducting mediums such as water or glass, the phase velocity is $b = (\varepsilon\mu)^{-1/2}$, and the index of refraction is $n = c/b = (\varepsilon_0\mu_0/\varepsilon\mu)^{-1/2}$. This relation holds for radio waves and, with moderate accuracy, for infrared radiation. For visible light it holds moderately well for some mediums but not for others. The constants ε and μ are associated with redistribution of charge in response to changes in the electromagnetic field. At low frequencies these movements follow the changes of the field in a simple way. At optical frequencies, when the field is reversing about 10^{14} times a second, the situation is more complicated. The effective value of μ at these frequencies is μ_0 and the effective value of ε is less than the value measured with static fields, or fields that vary more slowly—apart from the possibility of resonance, which will be considered later.

3. In conducting mediums, the electromagnetic waves are absorbed as they are propagated. This absorption is exponential; *i.e.*, the fraction absorbed in a thin layer of thickness d is βd, in which β is a constant the value of which can be calculated when ε and σ are known. For metals, β is very large so that a layer only a tenth of a micrometre in thickness absorbs about half of the incident light. This absorption is much stronger than that of nonconducting substances, which are normally regarded as opaque (such as ebony): these are usually quite transparent in thicknesses of a micrometre or so.

Although the simple theory is correct in predicting high absorption for metals in general, the values of β for different metals (calculated from ε and σ) are not correct. This is because the effective value of σ at high frequencies is not the same as that measured with direct current or low frequency alternating current.

4. The waves are transverse; the electric field vector (E) and the magnetic field vector (H) are perpendicular to one another and to the direction of propagation along the axis OZ as shown in Figure 23.

5. The two quantities E and H, the magnitudes of vectors E and H, fluctuate in phase, so that when E is a maximum H also is a maximum (Figure 23). This is implied in the equation

$$\varepsilon^{1/2}E = \mu^{1/2}H, \qquad (12)$$

which enables either E or H to be calculated when the other is known.

6. The electromagnetic field possesses energy, and the energy per unit volume (W) is equal to $\frac{1}{2}(\varepsilon E^2 + \mu H^2)$. In view of equation (12) above, this implies that for electromagnetic waves,

$$W = \varepsilon E^2. \qquad (13)$$

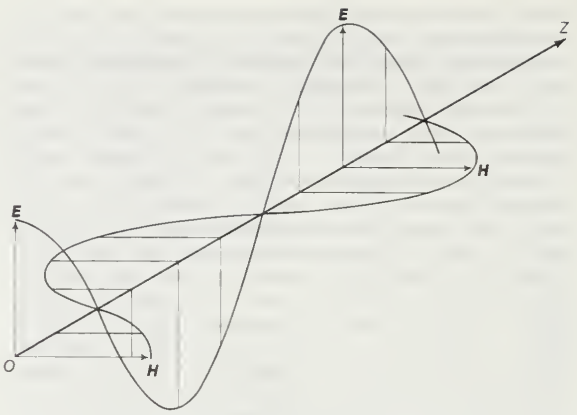

Figure 23: Electromagnetic wave, showing that electric field vector E and magnetic field vector H are in phase (see text).

The Poynting vector

7. The propagation of electromagnetic waves involves a transport of energy. A vector $S = E \times H$, called the Poynting vector (after an English physicist, John Henry Poynting), is used to describe this flow—*i.e.*, the energy flows in the direction of S (which is also the direction of wave propagation in an isotropic medium)—and the amount of energy crossing unit area (lying across the direction of flow) in unit time is equal to S—*i.e.*, to the magnitude of S. For electromagnetic waves $S = E \times H = (\varepsilon/\mu)^{1/2}E^2$, and this relation, combined with equation (13), implies that $S = W/(\varepsilon\mu)^{-1/2}E^2$, or $S = bW$; thus, the mean value of S is b times the mean value of W—*i.e.*, the energy crossing unit area in unit time is equal to the velocity multiplied by the energy density.

The linearity of Maxwell's equations implies that the law of superposition applies to electromagnetic waves. The electromagnetic theory is therefore able to give a satisfactory account of all the simpler phenomena of interference and diffraction already described above. There are a few problems for which it is clearly superior to the "scalar-wave" theory that was described. These include the polarization of light transmitted through a slit the width of which is of the same order of magnitude as the wavelength and also the polarization of light scattered from microscopic particles. Calculations based on the electromagnetic theory are sometimes difficult mathematically, but the results are in agreement with experiment.

The interaction of light with matter

REFLECTION AND REFRACTION

When light is incident in a perpendicular direction on the surface of a piece of glass, part is transmitted and part is reflected. This happens at any surface that forms the boundary between two transparent mediums of different refractive indices. For a particle theory of light, this phenomenon constitutes a serious difficulty. If a beam of light consists of a stream of particles all alike, because like causes produce like effects, there is no good reason why some should go through the surface and some be turned back. If the particles are not all the same (*e.g.*, if some have more energy and are therefore able to get through), then it would be expected that all those particles that do penetrate one surface would be able to pass through a second. This is never observed. In fact, the fraction of light transmitted at the second surface is the same as the fraction transmitted at the first (for light of one wavelength). Newton was aware of this fundamental difficulty and introduced the ad hoc hypothesis of particles with periodic oscillation between "fits of easy reflection" and "fits of easy transmission."

A wave theory of light, on the other hand, offers an explanation that follows in a natural and logical way from its premises. When a wave passes from one medium to another certain conditions must be fulfilled at the boundary. These conditions arise because the frequency of the transmitted wave must be the same as that of the incident wave. The velocities of light in the two mediums are different, and therefore, because velocity is the product of

wavelength times frequency, the wavelength cannot be the same. By way of analogy, elastic waves can be imagined falling on a welded boundary between two solids—*e.g.*, steel and brass—with point P_1 just inside the first medium and P_2 extremely near P_1 and just inside the second medium. Then if P_1 and P_2 do not move exactly together the material at the boundary must tear. If the boundary is so strong that it does not tear, then the waves at the boundary must match each other in a most precise way. This match is possible only if there is a reflected wave as well as a transmitted wave: when the density and the elastic properties of the two mediums are known then the fraction reflected can be calculated.

For light, the fraction reflected can be calculated when the indices of refraction are known, and it is found that the fraction reflected when a beam of light is incident perpendicular to a boundary between air (refractive index nearly equal to 1) and a medium of refractive index n is $(n-1)^2/(n+1)^2$. Thus for glass (index 1.5) about 4 percent is reflected, but for diamond (index 2.42) 17 percent is reflected. This result is predicted by any reasonably self-consistent wave theory including the electromagnetic-wave theory. When light is incident on a surface at an angle other than perpendicularly, however, the calculation of the fraction of light reflected is more difficult. This fraction depends both on the direction of incidence and on the polarization of the light.

Fresnel relations

Fresnel derived certain expressions (known as Fresnel's relations) for the amount of light reflected under various conditions, using an elastic solid theory. To do this he assumed boundary conditions chosen ad hoc—*i.e.*, to produce the correct result. In the electromagnetic theory there is no choice in regard to the conditions that must be satisfied at the boundary of two dielectrics. The boundary conditions are fixed by the constitutive equations and by general principles such as the conservation of energy. They are derived from experiments on electricity, not from experiments on light.

These boundary conditions may be applied to electromagnetic waves with the following results:

1. The existence of a wave reflected so that the angle of reflection is equal to the angle of incidence and of a refracted wave the direction of which obeys Snell's law.
2. All the results that Fresnel had previously obtained for the amounts of light reflected and refracted under a variety of conditions, including Brewster's law.
3. The existence of total reflection and of certain observed results in regard to the change of polarization of light that has been totally reflected (when the incident light is polarized).
4. The amount of light reflected at the surfaces of metals (including the result that strong reflection is, in general, obtained with good conductors).
5. A detailed description of certain complicated results obtained when light is incident upon the surface of a transparent anisotropic crystal (*e.g.*, calcite).

DISPERSION AND SCATTERING

Oscillating dipoles. In electrostatics, a dipole consists of two equal and opposite charges situated a small distance apart. The line joining the charges is called the axis of the dipole, the dipole moment M is the name given to the product of one charge times separation. An oscillating dipole may be thought of as one in which charges move so that M fluctuates between $+M_0$ and $-M_0$ (*i.e.*, $M = M_0 \sin 2\pi\nu_i t$). Maxwell's theory shows that an oscillating dipole produces electromagnetic waves that are nearly spherical at distances large compared with the size of the dipole. The total energy emitted is proportional to the square of the ratio M_0/λ^2 (in which $\lambda = c/\nu_i$).

Scattering by free electrons. When an electromagnetic wave (with an electric vector of amplitude E_0) operates on a free electron, it causes the electron to oscillate so as to produce an oscillating dipole with a moment proportional to E_0/λ^2. This dipole emits waves in all directions. These waves are regarded as scattered light. The scattered light is strongest in directions perpendicular to the axis of the dipole, which is the same as the direction of the electric vector in the incident wave. It is polarized with its electric vector in the plane containing the dipole. The ratio of the energy scattered to the energy incident per unit area is: $k = (1/6\pi\varepsilon_0^2)\,(e^4/m^2c^4)$, in which e is the charge and m is the mass of the electron. The energy scattered is equal to the amount of energy incident upon an area equal to k. For this reason k is called the scattering cross section or the scattering coefficient.

Scattering by bound electrons. A bound electron is subject to a restoring force when displaced from its equilibrium position, similar to a weight on the end of a spiral spring. An electron bound to an atom can oscillate with a natural frequency ν_0. Its motion produces an oscillating dipole and electromagnetic waves are emitted. Energy lost in this way constitutes damping, and the oscillation decays like the well-known damped harmonic oscillator of classical mechanics. The curve of decay is similar to the curve of a damped wave shown in Figure 14A. When a light wave is incident, a bound electron oscillates. The strength of the dipole produced and, hence, of the light scattered depends on the frequency (ν_i) of the light wave and also upon the frequency ν_0 and the damping constant γ of the electron.

Dipole radiation

The scattering cross section (k') is found to be:

$$k' = \frac{\nu_i^4}{(\nu_0^2 - \nu_i^2)^2 + \gamma^2\nu_0^2}\,k\,; \qquad (14)$$

and it reaches a maximum value when ν_i is nearly equal to ν_0; *i.e.*, when the incident wave is in resonance with the natural frequency.

Molecular scattering. Because atoms and molecules contain bound electrons, they scatter light, but not just like single bound electrons. The scattered wave has an amplitude proportional to the amplitude (E_o) of the incident wave and inversely to the distance from the scattering centre; *i.e.*, the electric vector E_r of the scattered wave is $\eta E_o/r$, in which η is a constant. This value applies to the wave emitted at right angles to the electric vector of the incident light. The phase of the scattered wave is either the same as that of the incident wave or differs from it by an amount that is the same for each molecule. Figure 24 shows a beam of light incident upon a layer of gas at low pressure. The

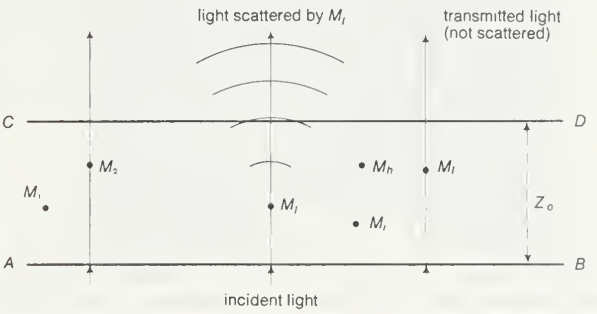

Figure 24: Scattering of light from molecules (see text).

molecules are irregularly placed so that the light scattered from different molecules, such as M_1, M_2, M_r, M_l, etc., in any direction (except the forward direction) is incoherent. The law of photometric summation (see above) applies, so that the total energy scattered by N molecules is just N times the energy scattered by one molecule.

A gas with N molecules per unit volume has an equivalent cross section (k_m),

$$k_m = \frac{8\pi}{3}\eta^2 N. \qquad (15)$$

In the forward direction the light scattered from different molecules is coherent because the total distance from the back edge of the gas layer (AB) to any molecule, such as M_l and M_l and thence to the front edge of the layer (CD) is equal to the thickness of the layer (z_0). Thus in the forward direction, the scattered waves can interfere with each other and with the wave representing the unscattered light. The resultant is a new wave in the forward direction but retarded—*i.e.*, with a phase lag $\eta\lambda N z_0$. In ordinary

wave theory, however, the velocity of light in a medium of refractive index n is c/n and the phase lag due to passage through a layer of thickness z_0 is equal to $2\pi(n-1)z_0$. Equating these two estimates of the lag requires

$$2\pi(n-1) = \eta\lambda^2 N. \tag{16}$$

and substituting for η from equation (16) into equation (15) implies that

$$k_m = \frac{32\pi^3}{3\lambda^4 N}(n-1)^2. \tag{17}$$

This equation was derived by Rayleigh. He also showed that the brightness of the blue sky is about that to be expected if the light is produced only by molecular scattering, and it is not necessary to suppose that there is any appreciable scattering by dust particles—in the high atmosphere and on a clear day. The factor $1/\lambda^4$ implies that the scattering coefficient for blue light ($\lambda = 400$ nanometres) is about six times larger than that for red light ($\lambda = 640$ nanometres) and this accounts for the blue colour. Laboratory measurements of the amount of scattered light agree with that calculated from equation (17). For the rare gases (*e.g.*, argon) the scattered light is almost completely plane-polarized; but other gases show less complete polarization (*e.g.*, 90 percent for carbon dioxide) as would be expected if their molecules possess an electric dipole moment. The light of the blue sky is polarized but polarization is reduced because some of the light has been scattered more than once.

Dispersion. Equation (17) implies that $(n-1)$ may be calculated if η is known; *i.e.*, if the ratio of the amplitude of the scattered wave to that of the incident wave can be calculated. Dispersion formulas for gases have been obtained by assuming that the atoms or molecules contain bound electrons having a response that varies with frequency in the manner described above. The methods of calculation involve the properties of atoms and molecules rather than those of light and are not considered in this article. Certain general results are readily obtained—*e.g.*, that for most transparent mediums the refractive index increases regularly toward the blue end of the spectrum (this is called normal dispersion). It is also found that in a region in which there is a strong absorption, the index varies rapidly, and over part of this region the dispersion is anomalous (*i.e.*, the index increases in the direction of larger wavelengths). This derives from equations (14) and (17).

Normal and anomalous dispersion

Scattering of larger particles. A particle that contains N atoms but is small compared with the wavelength of light has a dipole moment approximately N times that for a single atom. The scattered energy is then proportional to N^2, or to V^2, or to R^6 (if V is the volume, and R is the radius). Thus a particle 20 nanometres in diameter scatters about as much light as 10^{12} separate atoms. As the size of the particle increases, the scattering continues to increase, though more slowly. When the particle is larger than a wavelength it must be considered as a diffraction object. The ratio of effective cross section for scattering to actual cross section fluctuates as the size increases. The theory of this variation, in relation to size, refractive index, and absorption has been worked out and verified experimentally.

Scattering by macroscopic solids and liquids. In crystalline solids the atoms are regularly arranged so that the wavelets scattered in a given direction have regularly varying phases. They interfere to give a small resultant except in the direction of the forward wave. Scattering of light is small in relation to the number of atoms per unit volume and results largely from crystal defects. For X-ray wavelengths smaller than the interatomic distance, the coherent waves scattered in certain directions reinforce one another.

For amorphous solids and liquids the number of atoms in any volume having a diameter of about one wavelength is large and the scattering per atom, although usually larger than in crystals, is still small in relation to the number of atoms involved.

The Kramers–Kronig relation. Any satisfactory theory of dispersion must comply with the condition that the scattered wave can never appear in advance of the incident wave that produces it. Physicists Hendrick Anthony Kramers of The Netherlands and Ralph de Laer Kronig of Germany showed that this basic causality condition implies that the dispersion (*i.e.*, the variation of refractive index with frequency) and the absorption are not independent. They derived equations enabling the absorption to be calculated when the dispersion is known (for all frequencies) and vice versa. It is not surprising that a relationship should exist, because dispersion and absorption are each related to the resonators described above in connection with scattering by bound electrons. The relationship has been found of great importance in many branches of pure and applied physics.

MECHANICAL EFFECTS OF LIGHT

When light is emitted or absorbed there are three mechanical effects: (1) an exchange of energy, (2) an exchange of linear momentum, and (3) an exchange of angular momentum. These are manifested as (1) heating (or cooling), (2) a pressure, and (3) a torque. If the conservation laws apply, then light must possess energy, momentum, and angular momentum. All these effects are predictable either from classical electromagnetic theory or from quantum theory. They can all be explored in relation to either exchanges between light and macroscopic pieces of matter or interaction between radiations and atoms. In this section the first will be treated, leaving the latter for the next section.

Equation (13) is an expression for light energy according to electromagnetic theory, and every detector of light is an energy transducer (converter). There is a general theorem, valid for light and sound, predicting that radiation must exert a pressure equal to W (the energy per unit volume) on a body that absorbs it. Twice this pressure is produced if the light is totally reflected at normal incidence. In electromagnetic theory, when light falls at normal incidence on a metal surface, a current (proportional to the field E) is produced in the metal; and, because this occurs in the magnetic field of the light, there is a reaction proportional to the vector product of the electric and magnetic field strengths ($E \times H$) and normal to the surface—*i.e.*, a reaction proportional to the Poynting vector (S). For an insulator the induced current is the displacement current. Because the Poynting vector is proportional to W, the energy per unit volume, the pressure is proportional to W (further consideration shows that, in the usual units, it is equal to W).

Light pressure

The measurement of the linear momentum of light is difficult because, under normal experimental conditions, the pressure is less than 10^{-4} dyne per square centimetre. In Figure 25, light from powerful sources S_1 and S_2 falls

on the mirror vanes A_1 and A_2 that are at the ends of a rod suspended by a quartz fibre. The pressure on the vanes produces a couple or twisting of the fibre and hence a rotation of the system that is measured by the usual mirror-and-scale method. The true radiation pressure can be measured only when a certain thermal action, called the radiometer effect, has been eliminated. In the radiometer

effect, if radiation heats a surface, then molecules of gas that rebound from one side will move faster than those that rebound from the other, cooler side, and there will be a net pressure. In the period 1901 to 1905, when physicists were making the first accurate determination of light pressure, it was not possible to remove this effect by placing the system in a vacuum in which the number of molecules is at a minimum; instead, the effect was reduced by substituting the special cells for the vanes. Any radiometer effect within the cells produces no net force. The residual effects at outer surfaces are small and are the same whichever side of the cell is illuminated. The measured values (1) when radiation is absorbed and (2) when it is reflected agreed with theoretical values within 1 percent. By use of an alternative method of eliminating the radiometer effect, results in agreement with the theoretical values were also obtained.

It can be shown that a beam of circularly polarized light possesses angular momentum and thus should exert a torque upon a half-wave plate that reverses the rotation of polarization (*i.e.*, from left-handed to right-handed circularly polarized light or vice-versa). The experimental difficulties of measuring this torque (of about 10^{-11} dyne centimetre) are formidable and the overall error is about 10 percent. The result agrees with the theoretical value within this margin.

The density of radiation incident on the Earth's surface at its mean distance from the Sun is about 1.36 kilowatts per square metre (for a surface normal to the Sun's rays), and the corresponding light pressure is about 5×10^{-5} dyne per square centimetre. The total pressure on the Earth is about 6×10^{14} dynes, a minute fraction of the gravitational force exerted by the Sun.

Importance of the mechanical properties of light

The mechanical properties of light, difficult to measure in the laboratory, are important under certain astronomical conditions. Gravitational forces are proportional to the mass of a body and hence to the cube of its radius. For a body having large radius compared with the wavelength, the radiation pressure is proportional to the square of the radius. Whereas the attraction and repulsion may be equal and balanced for a medium size particle, for a smaller particle, the radiation pressure may be a large fraction of the whole force. For this reason, radiation pressure has a considerable effect in extending a comet's tail. In a star the outward flow of radiation from the centre produces a net force tending to expand the star, thus opposing the gravitational forces. Also, when radiation energy is transferred between two parts of a rotating star that are moving with different velocities, momentum transfers are involved. This produces an effect known as radiative viscosity because the resulting forces reduce the relative velocity of adjacent layers and so reduce the angular velocity of rotation.

Quantum theory of light

In the classical electromagnetic wave theory, the absorption of light is a continuous process and there is no lower limit to the amount of energy that an atom can absorb from light of given frequency. Energy can be exchanged, in infinitesimal amounts between radiation and atoms, in an enclosure that is in thermal equilibrium. The total energy of the enclosure should, in equilibrium at temperature T, be distributed so that each degree of freedom has an equal amount, kT, in which k is Boltzmann's constant. The number of possible modes of vibration for transverse waves with frequencies between ν and $\nu + d\nu$ is $8\pi\nu^2 d\nu$ per unit volume. (In this section all frequencies are temporal frequencies and ν is used for ν_t). If $\rho(\nu)d\nu$ is the radiation energy per unit volume in this frequency range, and c is the velocity of light, then the radiation density is as shown in curve R–J of Figure 26. This law, derived by Rayleigh and Jeans, is the inevitable consequence of classical wave theory. It predicts that the radiation density increases without limit as the frequency increases, and this implies that, in equilibrium, all the energy in the universe is found in the high-frequency end of the electromagnetic spectrum and none is present in matter. This catastrophe may be avoided by assuming that there is some upper limit to the possible frequency of radiation, but the Rayleigh–Jeans law does not agree with measurements of temperature radiation in the visible and ultraviolet regions of the spectrum (curve R–J, Figure 26). The experimental results are represented by curve P in Figure 26, and Planck suggested a formula, now called Planck's law, that fitted this curve. Originally this formula was probably an inspired guess, but Planck soon showed that it could be derived by assuming that a mode of frequency can change only by $h\nu$ (or by a multiple of $h\nu$) in which h is a new universal constant now called Planck's constant. The minimum "element of energy" (as Planck referred to it) is now called the quantum. For visible light the quantum is about 3.5×10^{-12} erg or 3.5×10^{-19} joule.

The theory in which Planck introduced the quantum was concerned with the interaction between radiation and matter. He expected that only minor modifications of the electromagnetic theory of light in free space and of the electron theory of matter would be needed. This expectation was not realized. Experiments, some of which will be described below, led Einstein to regard light as an assembly of entities, later called photons. A frequency ν, energy $h\nu$, momentum $h\nu/c = h/\lambda$, and angular momentum $h/2\pi$ are associated with a photon of circularly polarized light. In many situations the photons appear to be localized

Properties of a photon

concentrations of energy and momentum—*i.e.*, to have the properties of particles. Yet the evidence that led to the rejection of a corpuscular theory in favour of a wave theory is still as valid and as compelling as it was in the time of Fresnel.

The theory, which includes logical descriptions both of those experiments that seem to require a corpuscular theory and those that support a wave theory, is known as quantum mechanics. This is a general theory of radiation and matter—not a special hypothesis about their interaction. The account given below of some aspects of quantum mechanics that are important in relation to experiments on light must be related to the general theory (see MECHANICS: *Quantum mechanics*).

PHOTONS

When light of suitable wavelength is incident upon the clean surface of a metal, electrons are emitted. If W'_m is the maximum kinetic energy of one of those photoelectrons released by light of frequency ν, then it is found that the maximum kinetic energy is Planck's constant times the difference between two frequencies, or $W'_m = h(\nu - \nu_0) = h\nu - W'_0$, in which W'_0 is written for $h\nu_0$. No electrons are emitted when ν is less than the critical frequency ν_0. It is known from other experiments that a minimum amount of energy called the work function is needed for an electron to escape from a surface. If W'_0 is accepted as the work function for emission of a photoelectron, then it is easily understood that no electrons are emitted when frequency ν is less than the critical frequency and that the maximum energy of escape for an electron is $h\nu - W'_0$. Some electrons may make collisions after absorption of energy $h\nu$ and either fail to emerge from the surface or else emerge with lower energy. Escape

by gaining energy from two photons of frequency less than ν_0 is extremely improbable because the energy due to one absorption is almost always lost by collision before a second photon is absorbed.

The number of photons absorbed, and therefore the number of electrons released, are proportional to the energy density in the beam of light and to the time. The energy of individual electrons is independent of the energy density—*i.e.*, independent of the amplitude of the waves.

Bohr's postulate

Conservation of energy and momentum. Niels Bohr, a Danish physicist, postulated that an atom can exist only in one of a set of discrete stationary states of internal energy ($W_1, W_2, \ldots$). The frequency $h\nu_{nm}$ of light emitted in passing from state n to m is related to the energy difference by Bohr's frequency condition: that Planck's constant times the frequency is equal to the energy difference between two states; *i.e.*,

$$h\nu_{nm} = W_n - W_m.$$

For some pairs of states ($W_n - W_m$) can be measured by experiments on collisions between electrons and atoms, and Bohr's condition is found to be satisfied within the limits of experimental error. Many other, less direct but more accurate, experiments are also in agreement with this equation.

In Bohr's theory, and subsequently in quantum mechanics, an angular momentum is associated with each atomic state. In the simplest situation, when polarized light is emitted in a magnetic field, the angular momentum about a known axis changes by $h/2\pi$. The changes are such that angular momentum is conserved if a photon of circularly polarized light has an angular momentum of $h/2\pi$ about the direction of propagation.

Compton scattering

It was shown by a United States physicist, Arthur Holly Compton, that when X-radiation is scattered by a nearly free electron, there is a wavelength change. A formula that gives the wavelength change as a function of the angle of scattering was derived by assuming that a "particle" of energy $h\nu$ and momentum $h\nu/c$ collides with a particle of mass m that is at rest, and that energy and linear momentum are conserved. The resting electron gains momentum and kinetic energy by changing its speed. The photon cannot change its speed, which is always c. It therefore must change its frequency when it changes energy and momentum. The measured change of frequency agrees with that calculated by Compton.

An atom that has absorbed a quantum of energy $h\nu_{mn}$ and changed from state m to state n may return to state m with emission of a photon of the same frequency (resonance radiation)—*i.e.*, $\nu_{mn} = \nu_{nm}$. If there is a state s intermediate in energy between states m and n, the return may be in two stages; n to s and s to m, with the emission of two photons. The sum of the two quanta $h\nu_{ns}$ and $h\nu_{sm}$ is then equal to a single quantum $h\nu_{nm}$ so that energy is conserved. In gases, these emissions usually follow the absorption in less than a microsecond, and the term fluorescence is used to include both resonance radiation and multistage processes. In solids and liquids there are sometimes intermediate states that are metastable so that emission occurs over much longer periods (phosphorescence; see below *Luminescence*). In all these processes the frequency of the emitted radiation is not greater than that of the absorbed radiation in accord with an empirical law discovered in the 19th century. In quantum theory this law is a necessary consequence of conservation of energy.

Raman effect

In Rayleigh scattering, the frequency of the scattered light is equal to that of the incident light. The physicists Sir Chandrasekhara Venkata Raman of India and Leonid Isaakovich Mandelstamm of the Soviet Union independently discovered processes in which light is scattered by an atom or molecule that changes its state. There is a corresponding discrete change in the frequency of the scattered radiation. When the scattering atom or molecule is in its lowest state, the frequency of the unscattered radiation is always less than that of the incident light (Stokes lines). When light is scattered by a molecule that is not in its lowest state, photons of higher frequency may be found in the scattered radiation (anti-Stokes lines). The scattered photon then has more energy than the incident photon, but the molecule gives up energy by passing to a lower state. The Raman effect is observed when light is scattered by solids and liquids. There is also an additional kind of scattering in which photons exchange energy and momentum with the thermal vibrations of the solid or liquid (Brillouin scattering, named after a French-U.S. physicist, Léon Brillouin).

The experiments quoted are examples of a large number that are in accord with the view that, within the limits of measurement, energy and momentum are conserved in detail—*i.e.*, in each individual interaction between an atom and radiation.

Spontaneous and stimulated emission. Planck's theory gives the distribution of radiation energy with frequency in an assembly of atoms and radiation in thermodynamic equilibrium at a common temperature in an enclosure. An Austrian physicist, Ludwig Boltzmann, applying the same principles to the assembly of atoms, derived a formula that gives the distribution of atoms between different stationary states—*i.e.*, the ratio of the number N_n in any other state n to the number N_m in any other state m. In the enclosure now considered, Boltzmann's and Planck's laws must both be satisfied though each atom is changing its state frequently by emitting or absorbing a photon or by collision. Equilibrium can be maintained if, and only if, each individual reaction is balanced by its own reverse process. Einstein assumed that the equilibrium was maintained by the following process: (1) absorption of radiation at a rate $B_{mn}N_m\rho(\nu)$; (2) spontaneous emission at a rate $A_{nm}N_n$; and (3) stimulated emission at a rate $B_{nm}N_n\rho(\nu)$, in which A_{nm}, B_{mn}, and B_{nm} are constants, now known as Einstein coefficients. When the rate of absorption was equated to the rate of emission (*i.e.*, to the sum of spontaneous and stimulated emission), an equation of the same form as Planck's law was obtained. This equation became identical with Planck's law if

Einstein coefficients

$$B_{nm} = B_{mn} = \frac{c^3}{8\pi h\nu^3}A_{nm}. \qquad (18)$$

If there were no stimulated emission (*i.e.*, if $B_{nm} = 0$), Planck's law and Boltzmann's law could not both be satisfied. Einstein postulated the existence of stimulated emission in 1905, but for more than 30 years it appeared to be only of theoretical interest. At the densities of radiation then available, the rate of stimulated emission was small compared with the rate of spontaneous emission. Equation (18) shows that in the microwave region of the electromagnetic spectrum (frequencies of a few thousand megahertz) the ratio B_{mn}/A_{nm} is much larger than in the visible spectrum. Accordingly, it was much easier to develop microwave amplification by stimulated emission of radiation (maser) than the corresponding laser effect with radiation in or near the visible spectrum. The existence of stimulated emission can be fitted into a classical wave theory, like many other concepts that originated in relation to theories of photons.

Interference and diffraction of photons. It was at one time suggested that interference and diffraction phenomena are caused by collisions between photons considered as small particles, or at least to some kind of complex interaction between photons. A simple experiment performed by a British physicist, Geoffrey Ingram Taylor, in 1908 excludes this possibility. He photographed the diffraction pattern of a needle and reduced the illumination until long exposures were needed to obtain an image. When the chance of two or more energy quanta passing through the apparatus simultaneously was made extremely small, the diffraction pattern was exactly the same as that obtained with a strong source of light.

This experiment is supported by many later experiments, showing that interference and diffraction are to be associated with single photons. The discussion in the section on coherence above implies that when ordinary sources of light are used each photon can interfere only with itself and not with any other photon. An interference pattern can, of course, be photographed only by recording the effects of many photons because one photon can activate only one grain on the photographic plate, but it does not

matter whether the photons all arrive over a time span of a microsecond or of several weeks.

The photograph of an interference pattern is both a wave phenomenon because it shows the characteristic spatial periodicity and a quantum phenomenon because the whole energy of a photon can be used to activate a single grain. It is not possible to trace the path of one photon (regarded as a particle) through the apparatus and, at the same time, obtain the interference pattern. In Young's experiment there is no way of finding out through which slit a given photon passes—except by covering one slit and thus losing the interference fringes.

THE WAVE–PARTICLE NATURE OF LIGHT

Uncertainty relations. Experiments with the photoelectric effect show that energy can be transferred from one atom to another in a way that suggests that photons are corpuscles—*i.e.,* localized concentrations of energy and momentum. Other experiments imply equally clearly that the light emitted from an atom, when it loses energy, must be represented by wave groups. Both of these sets of experiments are equally valid, and together they require that the photon must have both wave-group and particle properties at the same time.

It will now be assumed that the intensity of the waves gives the relative probability that a suitable detector will detect a photon at a given point. Experimentally, waves and particles are both abstractions, each describing the same physical system. Quantum mechanics does not seek a relationship such that particles are guided by waves according to the laws of classical physics—as in the theory of the English physicist J.J. Thomson, in which photons are pictured as closed tubes of electric force guided by Maxwellian waves. The waves and particles now to be considered do not have all the relevant properties of classical waves and particles. When a photon is absorbed, the whole of a wave group, possibly extending over a large volume, is annihilated. The position of a photon particle cannot be exactly specified. It is known only that it is within the wave group and most likely exists where the waves are most intense. Also the energy and momentum of the photon are determined by the frequency of the waves. Fourier analysis of wave groups shows that, when the wave group is short (so that the position of the photon is fairly well determined), the frequency of the waves and, hence, the energy and momentum of the photon are known only within a wide range. The product of the uncertainty in position and the uncertainty in momentum can never be less than a certain minimum value. It will now be shown how these relations appear in some experimental situations.

In one experiment a parallel beam of light is incident on a slit of width d, producing a diffraction pattern on a screen. The y-coordinate, at the moment when a photon passes through the slit, is known within an uncertainty $\Delta y = \pm d$. The direction of propagation when the photons emerge from the slit is uncertain because of diffraction, but most of the photons are observed within an angular range $\pm\theta$, in which $\sin\theta = \lambda/d$. There is therefore an uncertainty Δp_y in the y-component of the momentum (p) of about $\pm(h \sin\theta)/\lambda$, so that the product of the two uncertainties, Δp and Δy, is

$$\Delta p \Delta y \sim \frac{dh \sin\theta}{\lambda} \sim h,$$

in which the sign $\sim$ indicates is of the "order of magnitude of." In a second experiment, monochromatic light is passed through an optical shutter. The shutter is opened for a short time Δt so that a wave group of duration Δt and length $\Delta z = c\Delta t$ passes through the shutter. Then $c\Delta t$ is the length l of the wave train. This implies that the frequency ν varies within a range $\Delta\nu = 1/\Delta t$—*i.e.,* that the photon energy varies within a range $\Delta E \sim h/\Delta t$ so that $\Delta E \Delta t \sim h$. More detailed analysis shows that, if the uncertainties Δt and ΔE are the root mean square deviations of statistical theory, then their product is equal to or larger than $h/4\pi$; so that $\Delta E \Delta t \geq h/4\pi$.

Uncertainty in energy of photons

Individual examples do not prove that the uncertainty relations are generally true any more than individual examples prove the general validity of the second law of thermodynamics. The fact that every example agrees, and that ingenious attempts to find exceptions all fail, constitutes a kind of proof by default, but the real proof is in the whole range of experimental work that demonstrates the equal status and inescapable association of wave and particle properties.

Maximum observations. The uncertainty relations show that precise measurement of both position and momentum are incompatible. It follows that a precise deterministic theory of particle dynamics is not appropriate because the precise initial condition of a particle is not observable. An extension of the uncertainty relations shows that the number of photons in a light beam and its phase cannot be simultaneously measured with precision, and thus a classical wave theory is also excluded.

In any experimental situation there are, in general, two or more observations that are compatible. Neither affects the other, and their results are independent of the order in which they are made. A complete assembly of such measurements is said to constitute a maximum observation. A state of a system is specified by giving the result of a maximum observation or in an equivalent way. The relative probabilities of future observations on a system can be calculated from the result of a maximum observation without reference to any previous results obtained on the system. For every system there is one certain prediction—that an immediate repetition of the maximum observation will give the same result.

Empirical questions. There is a certain type of question to which the quantum mechanics gives no direct answer because the question is not related to a possible observation. One may ask, for instance, what happens to a photon of right-handed circularly polarized light as it passes through a half-wave plate. It is known that the photon will emerge as a photon of left-handed circularly polarized light and that angular momentum is transferred to the plate. The wave theory gives an account of the progress of a wave through the plate. If, however, one tries to visualize the particle and asks for a mental picture of the way in which this particle alters as it goes through the plate, there is no ready answer. The theory has nothing to say unless an experiment is designed to determine what happens to the photon in passage through the plate. For example, a half-wave plate is split in two and the light is passed through the quarter-wave plate, which forms one half. It may subsequently be passed through a Nicol prism analyzer. There will be some orientation of the Nicol prism such that the photon will certainly pass through. If a Nicol prism is oriented at α to this direction, the probability for a single photon to pass through is $\cos^2\alpha$. This detailed theoretical prediction agrees with experiment. Thus the quantum mechanics correctly predicts the results of an experiment but leaves unanswered the original question about the way in which the photon, visualized as a particle, changes its angular momentum as it passes through the half-wave plate.

Assemblies of photons. The application of quantum mechanics to the electromagnetic field in an enclosure justifies a representation in terms of photons. These may be regarded as indistinguishable particles. Any number of these particles may exist simultaneously in the same energy state. The statistics of particles that obey these conditions is called Einstein–Bose statistics. The distribution of particles among different states may be calculated by the usual methods of statistical mechanics in which probability (or entropy) is maximized subject to certain limitations. In an assembly of material particles the total energy and also the number of particles are constants. With photons, the second condition is no longer valid because two photons of frequencies ν_{ns} and ν_{sm} may be replaced by one of frequency $\nu_{nm} = \nu_{ns} + \nu_{sm}$, thus decreasing the number of photons while conserving the total energy. The statistical calculation leads straightforwardly to Planck's law. It is found that for ordinary sources of light the probable number of photons in any given state is always much less than unity. For a laser source many photons are found in relatively few states, and, indeed, in an ideal single

mode continuously operated laser, all photons would be in one state.

A considerable amount of experimental and theoretical work has recently been done on coincidences of photon detection in two or more detectors that are observing the same source. This kind of photon statistics measures the coherence of light from a star and hence the size of the star.

Assemblies of photons and atoms. In the Dirac theory of absorption and emission of radiation, quantum mechanics is applied to an enclosure that contains radiation and free atoms or molecules. Processes involving creation and annihilation of photons with corresponding atomic transitions must maintain equilibrium. The theory derives expression for the Einstein A and B coefficients of absorption and emission and for their ratios. It is also shown that, whereas spontaneous emission is random, stimulated emission is coherent with the radiation that excites it. The theory extends to include an account of Rayleigh scattering (and hence of dispersion) and of the Raman effect. All problems concerned with the absorption, emission, and scattering of light are, in principle, soluble, although the mathematical formulation, even of approximate formulas, is usually difficult.

The quantum-mechanical theory is adequate at optical frequencies and at lower frequencies. It is also adequate at the higher frequencies associated with ultraviolet radiation and for X-ray scattering including the Compton effect. It is inadequate for photons of the still higher frequencies involved in the creation and annihilation of fundamental particles. It is to be expected that, in due course, a basic theory of electromagnetic forces and of their relation to gravitation and to the strong forces between nucleons will emerge. The present theory will then have the status of an approximation valid for a wide range of frequencies including the frequencies associated with visible light.

Limitations of quantum mechanics

(R.W.Di.)

Luminescence

SOURCES AND PROCESS

Luminescence is the emission of light by certain materials when they are relatively cool. It is in contrast to light emitted from incandescent bodies, such as burning wood or coal, molten iron, and wire heated by an electric current. Luminescence may be seen in neon and fluorescent lamps; television, radar, and X-ray fluoroscope screens; organic substances such as luminol or the luciferins in fireflies and glowworms; certain pigments used in outdoor advertising; and also natural electrical phenomena such as lightning and the aurora borealis. In all these phenomena, light emission does not result from the material being above room temperature, and so luminescence is often called cold light. The practical value of luminescent materials lies in their capacity to transform invisible forms of energy into visible light.

Luminescence emission occurs after an appropriate material has absorbed energy from a source such as ultraviolet or X-ray radiation, electron beams, chemical reactions, and so on. The energy lifts the atoms of the material into an excited state, and then, because excited states are unstable, the material undergoes another transition, back to its unexcited ground state, and the absorbed energy is liberated in the form of either light or heat or both (all discrete energy states, including the ground state, of an atom are defined as quantum states). The excitation involves only the outermost electrons orbiting around the nuclei of the atoms. Luminescence efficiency depends on the degree of transformation of excitation energy into light, and there are relatively few materials that have sufficient luminescence efficiency to be of practical value.

Luminescence a quantum process

Luminescence and incandescence. As mentioned above, luminescence is characterized by electrons undergoing transitions from excited quantum states. The excitation of the luminescent electrons is not connected with appreciable agitations of the atoms that the electrons belong to. When hot materials become luminous and radiate light, a process called incandescence, the atoms of the material are in a high state of agitation. Of course, the atoms of every material are vibrating at room temperature already, but this vibration is just sufficient to produce temperature radiation in the far infrared region of the spectrum. With increasing temperature this radiation shifts into the visible region. On the other hand, at very high temperatures, such as are generated in shock tubes, the collisions of atoms can be so violent that electrons dissociate from the atoms and recombine with them, emitting light: in this case luminescence and incandescence become indistinguishable.

Luminescent pigments and dyes. Nonluminescent pigments and dyes exhibit colours because they absorb white light and reflect that part of the spectrum that is complementary to the absorbed light. A small fraction of the absorbed light is transformed into heat, but no appreciable radiation is produced. If, however, an appropriate luminescent pigment absorbs daylight in a special region of its spectrum, it can emit light of a colour different from that of the reflected light. This is the result of electronic processes within the molecule of the dye or pigment by which even ultraviolet light can be transformed to visible—*e.g.*, blue—light. These pigments are used in such diverse ways as in outdoor advertising, blacklight displays, and laundering; in the latter case, a residue of the "brightener" is left in the cloth, not only to reflect white light but also to convert ultraviolet light into blue light, thus offsetting any yellowness and reinforcing the white appearance.

EARLY INVESTIGATIONS

Although lightning, the aurora borealis, and the dim light of glowworms and of fungi have always been known to mankind, the first investigations (1603) of luminescence began with a synthetic material, when Vincenzo Cascariolo, an alchemist and cobbler in Bologna, Italy, heated a mixture of barium sulfate (in the form of barite, heavy spar) and coal; the powder obtained after cooling exhibited a bluish glow at night, and Cascariolo observed that this glow could be restored by exposure of the powder to sunlight. The name *lapis solaris*, or "sunstone," was given to the material because alchemists at first hoped it would transform baser metals into gold, the symbol for gold being the Sun. The pronounced afterglow aroused the interest of many learned men of that period, who gave the material other names, including phosphorus, meaning "light bearer," which thereafter was applied to any material that glowed in the dark.

Today, the name phosphorus is used for the chemical element only, whereas certain microcrystalline luminescent materials are called phosphors. Cascariolo's phosphor evidently was a barium sulfide; the first commercially available phosphor (1870) was "Balmain's paint," a calcium sulfide preparation. In 1866 the first stable zinc sulfide phosphor was described. It is one of the most important phosphors in modern technology.

Phosphors

One of the first scientific investigations of the luminescence exhibited by rotting wood or flesh and by glowworms, known from antiquity, was performed in 1672 by Robert Boyle, an English scientist, who, although not aware of the biochemical origin of that light, nevertheless established some of the basic properties of bioluminescent systems: that the light is cold; that it can be inhibited by chemical agents such as alcohol, hydrochloric acid, and ammonia; and that the light emission is dependent on air (as later established, on oxygen).

In 1885–87 it was observed that crude extracts prepared from West Indian fireflies (*Pyrophorus*) and from the boring clam, *Pholas*, gave a light-emitting reaction when mixed together. One of the preparations was a cold-water extract containing a compound relatively unstable to heat, luciferase; the other was a hot-water extract containing a relatively heat-stable compound, luciferin. The luminescent reaction that occurred when solutions of luciferase and luciferin were mixed at room temperature suggested that all bioluminescent reactions are "luciferin–luciferase reactions." In view of the complex nature of bioluminescent reactions, it is not astonishing that this simple concept of bioluminescence has had to be modified. Only a small number of bioluminescent systems have been investigated for their respective luciferin and the corresponding luciferase, the best known being the bioluminescence of

Bioluminescence

fireflies from the United States, a little crustacean living in the Japanese sea (*Cypridina hilgendorfii*), and decaying fish and flesh (bacterial bioluminescence). Although bioluminescent systems have not yet found practical applications, they are interesting because of their high luminescence efficiency.

The first efficient chemiluminescent materials were nonbiological synthetic compounds such as luminol (with the formula 5-amino-2,3-dihydro-1.4-phthalazinedione). The strong blue chemiluminescence resulting from oxidation of this compound was first reported in 1928.

PHOSPHORESCENCE AND FLUORESCENCE

The name luminescence has been accepted for all light phenomena not caused solely by a rise of temperature, but the distinction between the terms phosphorescence and fluorescence is still open to discussion. With respect to organic molecules, the term phosphorescence means light emission caused by electronic transitions between levels of different multiplicity (explained more fully below), whereas the term fluorescence is used for light emission connected with electronic transitions between levels of like multiplicity. The situation is far more complicated in the case of inorganic phosphors.

The term phosphorescence was first used to describe the persistent luminescence (afterglow) of phosphors. The mechanism described above for the phosphorescence of excited organic molecules fits this picture in that it is also responsible for light persistence up to several seconds. Fluorescence, on the other hand, is an almost instantaneous effect, ending within about 10^{-8} second after excitation. The term fluorescence was coined in 1852, when it was experimentally demonstrated that certain substances absorb light of a narrow spectral region (*e.g.,* blue light) and instantaneously emit light in another spectral region not present in the incident light (*e.g.,* yellow light) and that this emission ceases at once when the irradiation of the material comes to an end. The name fluorescence was derived from the mineral fluorspar, which exhibits a violet, short-duration luminescence on irradiation by ultraviolet light.

LUMINESCENCE EXCITATION

Chemiluminescence and bioluminescence. Most of the energy liberated in chemical reactions, especially oxidation reactions, is in the form of heat. In some reactions, however, part of the energy is used to excite electrons to higher energy states, and, for fluorescent molecules, chemiluminescence results. Studies indicate that chemiluminescence is a universal phenomenon, although the light intensities observed are usually so small that sensitive detectors are necessary. There are, however, some compounds that exhibit brilliant chemiluminescence, the best known being luminol, which, when oxidized by hydrogen peroxide, can yield a strong blue or blue-greenish chemiluminescence. Other instances of strong chemiluminescences are lucigenin (an acridinium compound) and lophine (an imidazole derivative). In spite of the brilliance of their chemiluminescence, not all of these compounds are efficient in transforming chemical energy into light energy, because only about 1 percent or less of the reacting molecules emit light. During the 1960s, esters (organic compounds that are products of reactions between organic acids and alcohols) of oxalic acid were found that, when oxidized in nonaqueous solvents in the presence of highly fluorescent aromatic compounds, emit brilliant light with an efficiency up to 23 percent.

Role of enzymes

Bioluminescence is a special type of chemiluminescence catalyzed by enzymes. The light yield of such reactions can reach 100 percent, which means that almost without exception every molecule of the reacting luciferin is transformed into a radiating state. All of the bioluminescent reactions best known today are catalyzed oxidation reactions occurring in the presence of air.

Triboluminescence. When crystals of certain substances—*e.g.,* sugar—are crushed, luminescent sparkles are visible. Similar observations have been made with numerous organic and inorganic substances. Closely related are the faint blue luminescence observable when adhesive tapes are stripped from a roll, and the luminescence exhibited when strontium bromate and some other salts are crystallized from hot solutions. In all of these cases, positive and negative electric charges are produced by the mechanical separation of surfaces and during the crystallization process. Light emission then occurs by discharge, either directly, by molecule fragments, or via excitation of the atmosphere in the neighbourhood of the separated surface: the blue glow coming from adhesive tapes being unrolled is emitted from nitrogen molecules of the air that have been excited by the electric discharge.

Thermoluminescence. Thermoluminescence means not temperature radiation but enhancement of the light emission of materials already excited electronically by the application of heat. The phenomenon is observed with some minerals and, above all, with crystal phosphors after they have been excited by light.

Photoluminescence. Photoluminescence, which occurs by virtue of electromagnetic radiation falling on matter, may range from visible light through ultraviolet, X-ray, and gamma radiation. It has been shown that, in luminescence caused by light, the wavelength of emitted light generally is equal to or longer than that of the exciting light (*i.e.,* of equal or less energy). As explained below, this difference in wavelength is caused by a transformation of the exciting light, to a greater or lesser extent, to nonradiating vibration energy of atoms or ions. In rare instances—*e.g.,* when intense irradiation by laser beams is used or when sufficient thermal energy contributes to the electron excitation process—the emitted light can be of shorter wavelength than the exciting light (anti-Stokes radiation).

The fact that photoluminescence can also be excited by ultraviolet radiation was first observed by a German physicist, Johann Wilhelm Ritter (1801), who investigated the behaviour of phosphors in light of various colours. He found that phosphors luminesce brightly in the invisible region beyond violet and thus discovered ultraviolet radiation. The transformation of ultraviolet light to visible light has much practical importance.

Gamma rays and X rays excite crystal phosphors and other materials to luminescence by the ionization process (*i.e.,* the detachment of electrons from atoms), followed by a recombination of electrons and ions to produce visible light. Advantage of this is taken in the fluoroscope used in X-ray diagnostics and in the scintillation counter that detects and measures gamma rays directed onto a phosphor disk that is in optical contact with the face of a photomultiplier tube (a device that amplifies light signals).

Electroluminescence. Like thermoluminescence, the term electroluminescence includes several distinct phenomena, a common feature of which is that light is emitted by an electrical discharge in gases, liquids, and solid materials. Benjamin Franklin, in the United States, for example, in 1752 identified the luminescence of lightning as caused by electric discharge through the atmosphere. An electric-discharge lamp was first demonstrated in 1860 to the Royal Society of London. It produced a brilliant white light by the discharge of high voltage through carbon dioxide at low pressure. Modern fluorescent lamps are based on a combination of electroluminescence and photoluminescence: mercury atoms in the lamp are excited by electric discharge, and the ultraviolet light emitted by the mercury atoms is transformed into visible light by a phosphor.

Electric discharge

The electroluminescence sometimes observed at the electrodes during electrolysis is caused by the recombination of ions (therefore, this is a sort of chemiluminescence). The application of an electric field to thin layers of luminescing zinc sulfide can produce light emission, which is also called electroluminescence.

A great number of materials luminesce under the impact of accelerated electrons (once called cathode rays)—*e.g.,* diamond, ruby, crystal phosphors, and certain complex salts of platinum. The first practical application of cathodoluminescence was in the viewing screen of an oscilloscope tube constructed in 1897; similar screens, employing improved crystal phosphors, are used in television, radar, oscilloscopes, and electron microscopes.

The impact of accelerated electrons on molecules can

produce molecular ions, ions of molecule fragments, and atomic ions. In gas-discharge tubes these particles were first detected as "canal rays" or anode rays. They are able to excite phosphors but not as efficiently as electrons can.

Radioluminescence. Radioactive elements can emit alpha particles (helium nuclei), electrons, and gamma rays (high-energy electromagnetic radiation). The term radioluminescence, therefore, means that an appropriate material is excited to luminescence by a radioactive substance. When alpha particles bombard a crystal phosphor, tiny scintillations are visible to microscopic observation. This is the principle of the device used by an English physicist, Ernest Rutherford, to prove that an atom has a central nucleus. Self-luminous paints, such as are used for dial markings for watches and other instruments, owe their behaviour to radioluminescence. These paints consist of a phosphor and a radioactive substance, *e.g.,* tritium or radium. An impressive natural radioluminescence is the aurora borealis: by the radioactive processes of the sun, enormous masses of electrons and ions are emitted into space in the solar wind. When they approach the Earth, they are concentrated by its geomagnetic field near the poles. Discharge processes of the particles in the upper atmosphere yield the famous luminance of the auroras.

LUMINESCENT MATERIALS AND PHOSPHOR CHEMISTRY

The first phosphor synthesized was probably an impure barium sulfide preparation with very low luminance efficiency and with the serious shortcoming that it was rather quickly decomposed in moist air, yielding hydrogen sulfide. A more stable sulfide-type phosphor was produced in 1866 by heating zinc oxide in a stream of hydrogen sulfide. In 1887 it became known that these sulfides do not luminesce in a chemically pure state but only when they contain small quantities of a so-called activator metal. Later, other materials, such as certain metal oxides, silicates, and phosphates, were found to luminesce if they were prepared by special procedures.

Sulfide-type phosphors, activators, fluxes. The sulfides of zinc and of cadmium are the most important basic materials of sulfide-type phosphors. An important condition of getting highly efficient phosphors is that these sulfides must first be prepared to the highest possible chemical purity before the necessary amount of activator can be added precisely. The emission of zinc sulfide can be shifted to longer wavelengths by increasing substitution of the zinc ions by cadmium ions. Zinc sulfide and cadmium sulfide phosphors are especially efficient in electroluminescence.

Sulfide-type phosphors are produced from pure zinc or cadmium sulfide or their mixtures by heating them together with small quantities (0.1–0.001 percent) of copper, silver, gallium, or other salts (activators) and with about 2 percent of sodium or another alkali chloride at about 1,000° C (1,832° F). The role of the alkali halides is to facilitate the melting process and, above all, to serve as coactivators (fluxes). Only small quantities of the alkali halide are integrated into the phosphor, but this small quantity is highly important for its luminescence efficiency. Copper-activated zinc and cadmium sulfides exhibit a rather long afterglow when their irradiation has ceased, and this is favourable for application in radar screens and self-luminous phosphors.

Oxide-type phosphors. Certain oxide-type minerals have been found to luminesce when irradiated. In some of them, activators must first be introduced into the crystal. Examples are ruby (aluminum oxide with chromium activator—bright-red emission) and willemite (zinc orthosilicate with manganese activator—green emission). On the other hand, scheelite (calcium tungstate) emits a blue luminescence without activator. All of these minerals have been made synthetically, with remarkably higher efficiencies than those that occur naturally. Silicates, borates, and phosphates of the second group of the periodic table of elements, such as zinc silicate, zinc beryllium silicate, zinc and cadmium borates, and cadmium phosphates, become efficient phosphors when activated with manganese ions, emitting in the red to green region of the spectrum. They have been incorporated into colour television screens to emit the colours blue (silver-activated zinc sulfide), green (manganese-activated zinc orthosilicate), and red (europium-activated yttrium vanadate).

Synthetic phosphors

Centres, activators, coactivators, poisons. The study of phosphor chemistry has yielded a detailed picture of the role of the above-mentioned activators and fluxes. Philipp Anton Lenard, a physicist in Germany, was the first (1890) to describe activator ions as being distributed in zinc sulfide and other crystalline materials that serve as the host crystal. The activator ions are surrounded by host-crystal ions and form luminescing centres where the excitation–emission process of the phosphor takes place. These centres must not be too close together within the host crystal lest they inactivate each other. For high efficiency, only a trace of the activator may be inserted into the host crystal, and its distribution must be as regular as possible. In high concentration, activators act as "poisons" or "killers" and thus inhibit luminescence. The term killer is used especially for iron, cobalt, and nickel ions, whose presence, even in small quantities, can inhibit the emission of light from phosphors.

Killers

Phosphors, such as calcium tungstate or zinc sulfide, that need no activator appear to have their luminescing centres in special groups of atoms different from the symmetry of their own crystal lattice, such as the group WO_4 in the compound calcium tungstate ($CaWO_4$), or, similarly, the SiO_4 group in zinc orthosilicate, (Zn_2SiO_4). That luminescing properties of a centre are strongly dependent on the symmetry of neighbouring ion groups with respect to the whole phosphor molecule is clearly proved by the spectral shifts of certain phosphors activated with lanthanide ions, which emit in narrow spectral regions. Because of this altering effect on the symmetry of luminescing centres, small quantities (about 0.2 percent) of titania incorporated in zinc orthosilicate give a remarkable increase in luminescence. Titania is called an intensifier activator because it increases the host-crystal luminescence, whereas a substance that produces luminescence not exhibited by the chemically pure host crystal is called an originative activator.

The fluxes (*e.g.,* sodium chloride) act as coactivators by facilitating the incorporation of activator ions. Copper ions, for instance, are used as activators of zinc chloride phosphors and are usually introduced in the copper(II), or cupric, form (the Roman numeral indicates the oxidation state; that is, I means that the element has one electron involved in a chemical bond and II that it has two electrons involved; the larger oxidation state is indicated by the *-ic* ending and the smaller by the *-ous* ending). If a copper(II) compound is incorporated into the zinc sulfide by heating, copper(I) sulfide (or cuprous sulfide, formula Cu_2S) will be produced with crystals that will not fit into the host-crystal zinc chloride because their form is so different, and only a relatively few luminescent centres will be possible. On the other hand, if a coactivator such as sodium chloride is introduced along with the copper(II) salt, the copper(II) ions are reduced to form copper(I) chloride (or cuprous chloride, formula CuCl) crystals with the same structure as the host crystal. Thus, many luminescent centres will be produced, and strong activation will result.

In describing a luminescent phosphor, the following information is pertinent: crystal class and chemical composition of the host crystal, activator (type and percentage), coactivator (intensifier activator), temperature and time of crystallization process, emission spectrum (or at least visual colour), and persistence. A few phosphors and their activators are listed in Table 2.

Organic luminescent materials. Although the inorganic phosphors are industrially produced in far higher quantities (several hundred tons per year) than the organic luminescent materials, some types of the latter are becoming more and more important in special fields of practical application. Paints and dyes for outdoor advertising contain strongly fluorescing organic molecules such as fluorescein, eosin, rhodamine, and stilbene derivatives. Their main shortcoming is their relatively poor stability in light, because of which they are used mostly when durability is not required. Organic phosphors are used as optical brighteners for invisible markers of laundry, banknotes, identity cards, and stamps and for fluorescence microscopy of tis-

Table 2: Visual Properties of Some Luminescent Materials

phosphor (phosphor/activator; coactivator)	emission	
	colour*	persistence
rhombohedral Zn_2SiO_4/Mn 0.3% (rhombohedral zinc orthosilicate/manganese 0.3%); 1,200° C 60 min, slow cooling	green (525 nm)	short (0.01 sec)
β-Zn_2SiO_4/Mn 0.3% (beta zinc orthosilicate/manganese 0.3%); 1,600° C 10 min, quench cooling	yellow (610 nm)	short (0.01 sec)
cubic ZnS/Cu 0.03%; Cl (cubic zinc sulfide/copper 0.03%; chloride); 950° C 10 min, slow cooling	green-blue (516 nm)	long (hours)
hexagonal ZnS/Cu 0.03%; Cl (hexagonal zinc sulfide/copper 0.03%; chloride); 1,250° C 10 min, slow cooling	green (528 nm)	very long (up to 24 hours)

*The wavelengths of the respective emission maxima are given in parentheses. 1 nanometre (nm) = 10^{-9} metre = 1 millimicron = 10 angstroms.

sues in biology and medicine. Their "invisibility" is due to the fact that they absorb practically no visible light. The fluorescence is excited by invisible ultraviolet radiation (black light).

Photoradiation in gases, liquids, and crystals. When describing chemical principles associated with luminescence, it is useful, at first, to neglect interactions between the luminescing atoms, molecules, or centres with their environment. In the gas phase these interactions are smaller than they are in the condensed phase of a liquid or a solid material. The efficiency of luminescence in the gas phase will be far greater than in the condensed phases because in the latter the energy of the electrons excited by photons or by chemical-reaction energy can be dissipated as thermal, nonradiative energy by collision of the atoms or by the rotational and vibrational energy of the molecules. This effect has to be taken into account even more when the radiation of single atoms is compared with that of multiatomic molecules. For molecules, radiative (electronic-excitation) energy is internally converted to vibrational energy; that is, there are radiationless transitions of electrons in atoms. This is the explanation for the fact that only a relatively small number of compounds are able to exhibit efficient luminescence. In crystals, on the other hand, the binding forces between the ions or atoms of the lattice are strong compared with the forces acting between the particles of a liquid, and electron-excitation energy, therefore, is not as easily transformed into vibrational energy, thus leading to a good efficiency for radiative processes.

Effect of binding force

LUMINESCENCE PHYSICS

Mechanism of luminescence. The emission of visible light (that is, light of wavelengths between about 690 nanometres and 400 nanometres, corresponding to the region between deep red and deep violet) requires excitation energies the minimum of which is given by Einstein's law stating that the energy (E) is equal to Planck's constant (h) times the frequency of light (ν), or Planck's constant times the velocity of light (c) in a vacuum divided by its wavelength (λ); that is,

$$E = h\nu = \frac{hc}{\lambda}.$$

The energy required for excitation therefore ranges between 40 kilocalories (for red light), about 60 kilocalories (for yellow light), and about 80 kilocalories (for violet light) per mole of substance. Instead of expressing these energies in kilocalories, electron volt units (one electron volt = 1.6×10^{-12} erg; the erg is an extremely small unit of energy) may be used, and the photon energy thus required in the visible region ranges from 1.8 to 3.1 electron volts.

The excitation energy is transferred to the electrons responsible for luminescence, which jump from their ground-state energy level to a level of higher energy. The energy levels that electrons can assume are specified by quantum mechanical laws. The different excitation mechanisms considered below depend on whether or not the excitation of electrons occurs in single atoms, in single molecules, in combinations of molecules, or in a crystal. They are initiated by the means of excitation described above: impact of accelerated particles such as electrons, positive ions, or photons. Often, the excitation energies are considerably higher than those necessary to lift electrons to a radiative level; for example, the luminescence produced by the phosphor crystals in television screens is excited by cathode-ray electrons with average energies of 25,000 electron volts. Nevertheless, the colour of the luminescent light is nearly independent of the energy of the exciting particles, depending chiefly on the excited-state energy level of the crystal centres.

Electron excitation

Electrons taking part in the luminescence process are the outermost electrons of atoms or molecules. In fluorescent lamps, for example, a mercury atom is excited by the impact of an electron having an energy of 6.7 electron volts or more, raising one of the two outermost electrons of the mercury atom in the ground state to a higher level. Upon the electron's return to the ground state, an energy difference is emitted as ultraviolet light of a wavelength of 185 nanometres. A radiative transition between another excited state and the ground-state level of the mercury atom produces the important ultraviolet emission of 254-nanometre wavelength, which, in turn, can excite other phosphors to emit visible light. (One such phosphor frequently used is a calcium halophosphate incorporating a heavy-metal activator.)

This 254-nanometre mercury radiation is particularly intensive at low mercury vapour pressures (around 10^{-5} atmosphere) used in low-pressure discharge lamps. About 60 percent of the input electron energy may thus be transformed into near-monochromatic ultraviolet light; *i.e.,* ultraviolet light of practically one single wavelength.

Whereas at low pressure there are relatively few collisions of mercury atoms with each other, the collision frequency increases enormously if mercury gas is excited under high pressure (*e.g.,* eight atmospheres or more). Such excitation leads not only to collisional de-excitation of excited atoms but also to additional excitation of excited atoms. As a consequence, the spectrum of the emitted radiation no longer consists of practically one single, sharp spectral line at 254 nanometres, but the radiation energy is distributed over various broadened spectral lines corresponding to different electronic energy levels of the mercury atom, the strongest emissions lying at 303, 313, 334, 366, 405, 436, 546, and 578 nanometres. High-pressure mercury lamps can be used for illumination purposes because the emissions from 405 to 546 nanometres are visible light of bluish-green colour; by transforming a part of the mercury line emission to red light by means of a phosphor, white light is obtained.

When gaseous molecules are excited, their luminescence spectra show broad bands; not only are electrons lifted to levels of higher energy but vibrational and rotational motions of the atoms as a whole are excited simultaneously. This is because vibrational and rotational energies of molecules are only about 10^{-2} and 10^{-4}, respectively, those of the electronic transition energies, and these many energies can be added to the energy of a single electronic transition, which is represented by a multitude of slightly different wavelengths making up one band. In larger molecules, several overlapping bands, one for each kind of electronic transition, can be emitted. Emission from molecules in solution is predominantly bandlike caused by interactions of a relatively great number of excited molecules with molecules of the solvent. In molecules, as in atoms, the excited electrons generally are outermost electrons of the molecular orbitals.

The terms fluorescence and phosphorescence can be used here, on the basis not only of the persistence of luminescence but also of the way in which the luminescence is produced. When an electron is excited to what is called, in spectroscopy, an excited singlet state, the state will have a lifetime of about 10^{-8} second, from which the excited electron can easily return to its ground state (which normally is a singlet state, too), emitting its excitation energy

as fluorescence. During this electronic transition the spin of the electron is not altered; the singlet ground state and the excited singlet state have like multiplicity (number of subdivisions into which a level can be split). An electron, however, may also be lifted, under reversal of its spin, to a higher energy level, called an excited triplet state. Singlet ground states and excited triplet states are levels of different multiplicity. For quantum mechanical reasons, transitions from triplet states to singlet states are "forbidden," and, therefore, the lifetime of triplet states is considerably longer than that of singlet states. This means that luminescence originating in triplet states has a far longer duration than that originating in singlet states: phosphorescence is observed.

Phosphorescence

The interactions of a large number of atoms, ions, or molecules are greater still in solution and in solids; to obtain a narrowing of the spectral band, subzero temperatures (down to that of liquid helium) are applied in order to reduce vibrational motions. The electronic energy levels of crystals such as zinc sulfide and other host crystals used in phosphors form bands: in the ground state practically all electrons are to be found on the valence band, whereas they reach the conduction band after sufficient excitation (see MATTER). The energy difference between the valence band and the conduction band corresponds to photons in the ultraviolet or still shorter wavelength region. Additional energy levels are introduced by activator ions or centres bridging the energy gap between valence band and conduction band, and, when an electron is transferred from the valence band to such an additional energy level by excitation energy, it can produce visible light on return to the ground state. A rather close analogy exists between the forbidden transitions of certain excited molecular electronic states (triplet–singlet, leading to phosphorescence) and the transition of an electron of an inorganic phosphor kept in a trap: traps (certain distortions in the crystal lattice) are places in the crystal lattice where the energy level is lower than that of the conduction band, and from which the direct return of an electron to the ground state is also forbidden.

When a solid is bombarded by photons or particles, the excitation of the centres can occur directly or by energy transfer. In the latter case, excited but nonluminescing states are produced at some distance from the centre, with the energy moving through the crystal in the form of excitons (ion-electron pairs) until it approaches a centre where the excitation process can occur. This energy transfer can also be realized by radiation in inorganic phosphors containing two activators, as well as in solutions of organic molecules.

Spontaneous and stimulated emission. The radiative return of excited electrons to their ground state occurs spontaneously, and when there exists an assembly of excited electrons their individual spontaneous radiative transitions are independent of each other. Therefore, the luminescence light is incoherent (the emitted waves are not in phase with each other) in this case. Sometimes the emission of luminescence can be stimulated by irradiation with photons of the same frequency as that of the emitted light; such stimulated transitions are used in lasers, which produce very intensive beams of coherent monochromatic light.

Exponential decay

The spontaneous luminescent emission follows an exponential law that expresses the rate of intensity decay and is similar to the equation for the decay of radioactivity and some chemical reactions. It states that the intensity of luminescent emission is equal to an exponential value of minus the time of decay divided by the decay time, or $L = L_0 \exp(-t/\tau)$, in which L is the intensity of emission at a time t after an initial intensity L_0, and τ is the decay time of the luminescence; that is, the time in which the assembly of the excited atoms would decrease in luminescence intensity to a value of $0.368\ L_0$.

When excited atoms of the centres are in contact with other atoms, as is the case in condensed phases (liquids, solids, in gases of not-too-low pressure), part of the excitation energy will be transformed into heat by collisional deactivation (thermal quenching). The decay time, therefore, has to be replaced by an effective excited-state lifetime, resulting in a more complicated exponential decay law that depends on the collision frequency, the energy imparted to the excited atoms of the centre that causes the transfer of excitation energy into heat (activation energy), a constant, and the temperature of the luminescent material. This law describes the actual luminescence decay of a great number of luminescent materials; *e.g.*, calcium tungstate.

Increase of activation energy for nonradiative deactivation of excited-centres luminescence decay can be achieved by changing the host crystal or by electron traps. The traps are imperfections in the crystal lattice where electrons are captured after they have been ejected from a luminescent centre by excitation energy. That the luminescent properties of phosphor centres are strongly dependent on the chemical nature of the host crystal may be seen in Table 3, showing that the same activator ions (manganese ions with two positive charges, indicated as Mn^{2+}, or Mn[II]), in different host crystals yield remarkably different-coloured emissions and decay times (measured in fractions of a second).

Prolonging the emission time of phosphors up to days or even longer (production of phosphorescence of the phosphors) is possible by inserting traps into the host crystal. Trapped electrons cannot return directly to the centre. In order to be released from the traps they must first obtain additional thermal energy—in this case, thermal energy stimulates luminescence—after which they recombine with a centre and undergo radiative transition. Trapping in crystals has its analogy to forbidden transitions in molecules (triplet–singlet transitions) or in radiation processes from metastable atomic-energy levels.

Table 3: Influence of Host Crystal on the Lifetime and Emission Colour of the Excited Phosphors

host crystal	activator	time (second)	emission colour
Tetragonal zinc fluoride, ZnF_2	manganese(II)	0.1	orange
Rhombic cadmium sulfate, $CdSO_4$	manganese(II)	0.05	orange
Rhombic magnesium sulfate, $MgSO_4$	manganese(II)	0.03	red
Rhombic zinc phosphate, $Zn_3(PO_4)_2$	manganese(II)	0.02	red
Cadmium silicate, $CdSiO_3$	manganese(II)	0.019	orange
Zinc orthosilicate, Zn_2SiO_4	manganese(II)	0.018	yellow
Cadmium pyroborate, $Cd_2B_2O_5$	manganese(II)	0.015	red orange
Rhombohedral zinc orthosilicate, Zn_2SiO_4	manganese(II)	0.013	green
Rhombohedral zinc germanate, Zn_2GeO_4	manganese(II)	0.0105	green yellow
Cubic zinc aluminate, $ZnAl_2O_4$	manganese(II)	0.0055	blue green
Cubic zinc gallate, $ZnGa_2O_4$	manganese(II)	0.0043	green blue
Hexagonal zinc sulfide, ZnS	manganese(II)	0.0004	orange

An example of a practical application of stimulated emission of a phosphor with trapped electrons is cubic strontium sulfide/selenide activated with samarium and europium ions, the coactivators being strontium sulfate and calcium fluoride. This phosphor has been used in devices for viewing scenes at night by reflected infrared light emitted by infrared lamps. The traps in this phosphor have been identified as samarium ions, whereas europium ions are the active ions in the centres. The phosphor is first excited by photons of about three electron volts (blue light), which results in an ejection of an electron from a europium ion (Eu^{2+}) centre. This excited electron is trapped by a triply charged samarium ion (Sm^{3+}), which is transferred to a doubly charged samarium ion (Sm^{2+}). Heat or irradiation by infrared photons releases one electron from the doubly charged samarium ion (Sm^{2+}). The electron is then recaptured from a triply charged europium ion (Eu^{3+}), yielding an excited doubly charged europium ion (Eu^{2+}), which returns to its ground state by emitting a photon of 2.2 electron volts energy (yellow light). The trap depth of this phosphor (*i.e.*, the energy required for release of an electron from it) is large compared to the thermal

energy of the lattice of the host crystal, and, therefore, the lifetime of the traps at room temperature is many months long. Bombarding this phosphor with photons of energy higher than that of infrared photons but not sufficient for excitation can lead to photoquenching: the traps are emptied far more rapidly, and thermal deactivation of the centres is enhanced.

When iron, cobalt, or nickel ions are present in a phosphor, an excited electron can be captured by these ions. The excitation energy is then emitted as infrared photons, not as visible light, so that luminescence is quenched. These ions, therefore, are called killers—the killing process being opposite to stimulation.

In chemiluminescence, such as the oxidation of luminol, light emission depends not only on radiative and quenching or intramolecular deactivation processes but also on the efficiency of the chemical reaction leading to molecules in an electronically excited state.

In bioluminescence reactions, the production of electronically excited molecules, as well as their radiative transitions back to their ground state, is efficiently catalyzed by the enzymes acting here, and bioluminescence light output is therefore high.

The luminescence photons emitted by one kind of excited atom, molecule, or phosphor can excite another to emit its specific luminescence: this type of energy transfer is observed with inorganic as well as organic substances. Thus, excited benzene molecules can excite naphthalene molecules by radiative-energy transfer. The radiation produced by the luminol chemiluminescence can produce fluorescence when fluorescein is added to the reaction mixture. In most of these cases the acceptor molecules have luminescent electrons with energy levels lower than those of the primary excited molecules, and emitted secondary luminescence is therefore of longer wavelength than the primary. Practical application of this phenomenon, called cascading, is used in radar kinescopes, which have composite fluorescent screens consisting of a layer of blue-emitting zinc sulfide/silver (chloride) phosphor—the hexagonal crystal, ZnS/Ag(Cl) deposited on a layer of yellow-emitting zinc or cadmium sulfide/copper [chloride] phosphor [the hexagonal crystal, (Zn,Cd)S/Cu (Cl)].

Cascading

The cathode-ray electrons excite the blue-emitting phosphor, whose photons, in turn, excite the yellow-emitting phosphor, which has traps with a decay time of about 10 seconds. Excitation of the blue-emitting phosphor alone would be unfavourable, as the sharply focussed cathode rays are absorbed by the blue phosphor to a small extent only, and its decay time is too short; also, direct excitation of the yellow-emitting phosphor alone would yield poor efficiency because the traps are emptied too rapidly by the heat produced by the relatively high-energetic electron impact.

Another energy-transfer mechanism is referred to as sensitization: a calcium carbonate phosphor (rhombohedral $CaCO_3$/Mn), for example, emits orange light under cathode-ray irradiation but is not excited by the 254-nanometre emission of mercury atoms, whereas this emission produces the same orange light with calcium carbonate (rhombohedral $CaCO_3$) activated by manganese and lead ions. This is not cascade luminescence: a mechanical mixture of a manganese and a lead-activated calcium carbonate exhibits no emission under ultraviolet radiation. In a phosphor containing both activators, the lead ions act as sensitizers in introducing an additional excitation band into the system from which the manganese ions get their excitation energy in a nonradiative energy transfer. Similar sensitization is observed in gases and in liquids.

Solid state energy states. The complicated problems concerning the energy states in solids of a luminescence centre are commonly visualized by adapting the energy-level diagram used in describing energy transitions in an isolated diatomic molecule (Figure 27).

In this diagram, the potential energy of a centre is plotted as a function of the average distance ($\bar{x}$) between the atoms: $\bar{x}^*$ represents the ground state and $\bar{x}_0$ represents the lowest excited state of the centre. In a tetrahedral permanganate-ion centre (MnO_4), for example $\bar{x}$ would be the average distance between the central manganese ion and an oxygen ion in any of the corners of the tetrahedron.

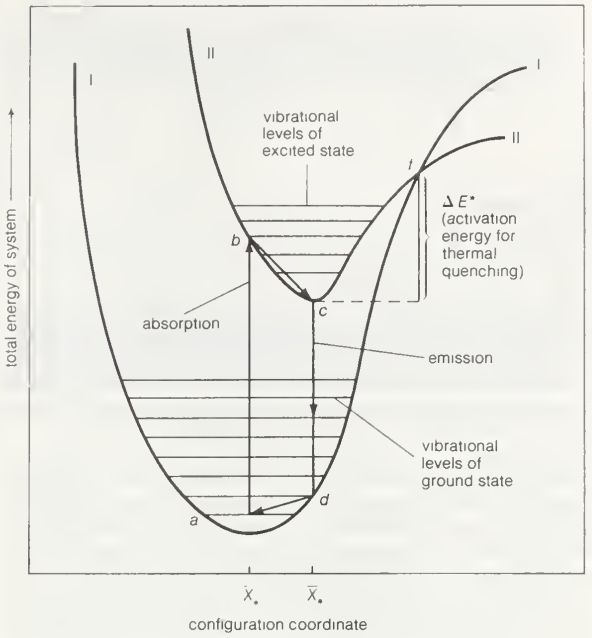

Figure 27: Energy levels of a luminescent centre (see text).

At a temperature of absolute zero the ground-state energy level is near the bottom of curve I at the minimum amplitude of atomic vibration. At room temperature (300 K [81° F]) the ground state lies higher, at *a*, where the centre has considerable vibrational energy. When an electron of the centre is excited, it is lifted to the higher energy level at *b* in curve II. This electronic transition occurs far more rapidly than the readjustment of the atoms of the centre, which then occurs within a time of about 10^{-12} second to reach the minimum vibrational level at *c*. The energy difference $(b - c)$ is dissipated as heat in the host-crystal lattice. From the excited-state level *c*, the electron can return to the ground-state level *d* shown in Curve I, the liberated energy being emitted as a photon.

The last step is a readjustment of the centre to *a*, the energy difference $(d - a)$ again being dissipated as heat. Nonradiative transition of the excited electron back to its ground state occurs when the electron is excited to an energy level above the intersection point *f* of the ground-state and the excited-state energy curve. This is caused mainly by increasing the vibrations of the lattice by application of higher temperatures. The energy difference $(f - c)$ is equal to the activation energy already mentioned, and therefore most centres become increasingly nonradiative at higher temperatures. In trap-type phosphors the temperature must be sufficiently high, of course, to eject the electron from the traps.

In some phosphors—calcium tungstate ($CaWO_4$), for example—absorption and emission of the exciting energy appear to take place mainly in the same centre; the excited electron remains near the centre. Such phosphors do not exhibit photoconductivity because only a few excited electrons succeed in reaching the conduction band where they are freely mobile. The luminescence decay is exponential.

Photoconducting phosphors

Zinc sulfide phosphors, however, are photoconducting, which means that many excited electrons are lifted to the conduction band of the host crystal. The energy levels of different centres and of the host-crystal lattice have to be taken into account simultaneously.

The relative levels of the zinc sulfide valence band (ground state of the host-crystal lattice) and the conduction band (excited state of the host-crystal lattice), of activator levels and of trap levels are shown in Figure 28. Points 1, 2, 3, and 4 represent one situation in a host crystal, and points 5, 6, 7, 8, 9, and 10 represent another situation.

The activator ions introduce additional ground-state levels and excited-state levels of energies between those of the valence and the conduction band of the zinc sulfide. When the excitation energy is sufficiently high, an electron is raised to the conduction band ($1 \rightarrow 2$, $5 \rightarrow 6$, corre-

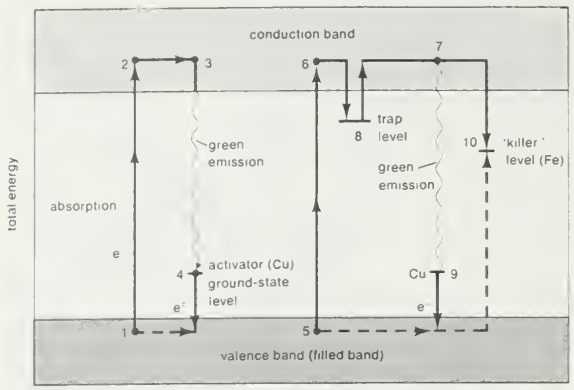

Figure 28: Transition of an electron from the valence band to the conduction band by light absorption (see text).

sponding to the ionization continuum in a gas). It moves away from the centre ($2 \rightarrow 3$, $6 \rightarrow 8$) and may either be trapped by an imperfection of the lattice (8) or return to an ionized centre (activator), in which it first occupies an excited level ($3 \rightarrow 4$) and then drops to the ground state of the activator centre by emitting a photon. An activator centre that captures such an excited electron has already lost one of its own electrons to a positive hole (electron vacancy) in the host-crystal lattice.

The energetic level of the traps is about 0.25 electron volt beneath the conduction-band level. A trapped electron (8) must be raised to the conduction band by thermal energy before a recombination with an ionized activator centre can occur. The green emission (530 nanometres) of the zinc sulfide phosphor (ZnS/Cu) is explained by the recombination of an electron from the conduction band and a copper ion in an activator centre ($7 \rightarrow 9$); the blue emission (463 nanometres) is due to recombination of the excited electron and a copper ion in an interstitial place.

Direct excitation of the activator centres is also possible. When an electron recombines with a killer ion (10), no visible emission occurs.

In solid-state electroluminescence, the radiative processes occurring in a phosphor under irradiation are produced by applying external electric fields of several hundred volts, alternating at several thousand cycles per second. Special preparations of zinc sulfide (hexagonal ZnS), with an iodine coactivator and high concentrations of a copper activator, are embedded in a thin layer of about 0.01 centimetre (0.004 inch) of insulating organic material or glass, which is mounted between the electrodes.

High luminescence efficiencies result. Application of a direct-current field yields luminescence in crystals of gallium arsenide (GaAs), silicon carbide (SiC), cadmium sulfide (CdS), and zinc monocrystals of sulfide with copper activator (ZnS/Cu); the cathode injects electrons into the conduction band, whereas the anode removes electrons.

Efficiency of luminescence; luminance. The efficiency of luminescence emission must be regarded on an energy and a quantum basis. When every exciting photon yields an emitted photon of the same energy (as is the case for resonance excitation—*i.e.*, excitation of fluorescence by a monochromatic light of exactly the same wavelengths as the resulting fluorescence—and radiation of isolated atoms in dilute gases), the luminescence efficiency is 100 percent with respect to input energy as well as to the number of quanta. When the number of secondary photons is equal to that of the primary but their energy is less because some energy is dissipated as heat, the quantum efficiency is 100 percent but the luminescence efficiency is less than 100 percent. The quantum efficiency of most luminescences is far lower than 100 percent; zinc sulfide phosphors have about 20 percent efficiency, and solid-state electroluminescence is less than 10 percent efficient.

Quantum efficiency

In chemiluminescence the quantum efficiency is about 1 percent in "brilliant" reactions, such as the oxidation of luminol, and up to 23 percent in the oxalate chemiluminescence. Solid-state electroluminescence, or electroluminescence of gases excited by high-frequency electric fields, is usually less than 10 percent.

The light intensity of luminescent processes depends chiefly on the excitation intensity, the density, and the lifetime of the radiative atoms, molecules, or centres. For practical purposes this luminous intensity per unit area is called photometric brightness or luminance of a material and is measured in lambert or millilambert (0.001 lambert) units (one lambert is equal to one candle per square centimetre divided by π). (K.-D.G.)

BIBLIOGRAPHY

General works. A.C.S. VAN HEEL and C.H.F. VELZEL, *What is Light?* (1968; originally published in Dutch, 1968), is a good book for the general reader; numerous illustrations are accompanied by a simple text. MARCEL MINNAERT, *Light and Colour in the Outdoors* (1993; originally published in Dutch, 1937), also recommended for the general reader, deals with optical effects such as rainbows, mirages, and many other effects of light and colour. MAX BORN and EMIL WOLF, *Principles of Optics*, 6th ed. (1980, reprinted 1993), is a comprehensive treatise on the wave theory of light, particularly strong on diffraction, scattering, polarization, and coherence—suitable for the reader with advanced mathematical knowledge. R.W. DITCHBURN, *Light* (1953, reprinted 1991), is a text at the university level that includes both theory and experimental evidence in relation to wave phenomena and quantum optics. K.D. FROOME and L. ESSEN, *The Velocity of Light and Radio Waves* (1969), critically reviews modern methods of measuring the constant *c*. The work by J.H. SANDERS, *Velocity of Light* (1965), contains reprints of original papers by A.A. Michelson, F.G. Pease, F. Pearson, Louis Essen, A.C. Gordon-Smith, and E. Bergstrand, together with a review of other work on the subject. The history of early theories is traced in A.I. SABRA, *Theories of Light, From Descartes to Newton* (1967, reissued 1981). RICHARD MORRIS, *Light* (1979), provides a general introduction with good bibliographies. MICHAEL I. SOBEL, *Light* (1987), is an interesting, understandable, yet technical account with historical and practical examples.

Quantum mechanics and electromagnetic theory. LEONARD I. SCHIFF, *Quantum Mechanics*, 3rd ed. (1968), is a systematic exposition of the physical concepts of quantum mechanics, including a description of the electromagnetic field and its interactions with matter. JOSEPH NEEDHAM, *Science and Civilisation in China*, vol. 4, pt. 1 (1962), includes an authoritative account of the study of light in ancient China and a detailed comparison with parallel developments due to Greek and Arab philosophers. EDMUND WHITTAKER, *A History of the Theories of Aether & Electricity*, rev. and enlarged ed., 2 vol. (1951–53, reissued in 1 vol., 1989), deals with the background to the development of the electromagnetic theory of light in the 19th century. F.H. READ, *Electromagnetic Radiation* (1980), includes lucid explanations of the basic concepts.

Luminescence. E. NEWTON HARVEY, *A History of Luminescence from the Earliest Times Until 1900* (1957), a classical work, deals rather extensively with the historical development of the different types of luminescence, especially bioluminescence and chemiluminescence. E.J. BOWEN (ed.), *Luminescence in Chemistry* (1968), is a textbook for students and researchers. C.A. PARKER, *Photoluminescence of Solutions* (1968), explains in detail the basic principles of luminescence as applied to photoluminescence in solutions, kinetics, apparatus, and analytic applications. M. ZANDER, *Phosphorimetry* (1968), is the first modern monograph dealing exclusively with the phosphorescence of organic materials, with a complete bibliography. GEORGE G. GUILBAULT (ed.), *Fluorescence: Theory, Instrumentation, and Practice* (1967), is a fairly technical account written by outstanding specialists in their respective fields (good background knowledge is necessary). DAVID M. HERCULES (ed.), *Fluorescence and Phosphorescence Analysis* (1966), comprises chapters of different grades of detail covering the luminescence field. G.F.J. GARLICK, "Luminescence," *Handbuch der Physik*, vol. 26, pp. 1–128 (1958), an extended text (written in English), systematically explains the physical phenomena and theory of luminescence. MARVIN C. GOLDBERG (ed.), *Luminescence Applications in Biological, Chemical, Environmental, and Hydrological Sciences* (1989), is a complete compilation of original research in a wide variety of areas. (R.W.DI./K.-D.G./Ed.)

Lima

Lima, the national capital of the Republic of Peru, is also the country's commercial and industrial centre. Central Lima is located at an elevation of 512 feet (156 metres) on the south bank of the Río Rímac, about eight miles (13 kilometres) inland from the Pacific Ocean port of Callao, and has an area of 27 square miles (70 square kilometres). Its name is a corruption of the Quechua Indian name Rímac, meaning "Talker." The city forms a modern oasis, surrounded by the Peruvian coastal desert and overshadowed by the neighbouring Andes mountains.

This article is divided into the following sections:

Physical and human geography

THE CHARACTER OF THE CITY

Perhaps the best clue to the significance of Lima to the nation of Peru can be found in its most popular nickname: El Pulpo ("The Octopus"). Metropolitan Lima's huge size—it accounts for about one-third of the total population of Peru—has both resulted from and stimulated the concentration of people, capital, political influence, and social innovations. Lima's unique status is but one of the more important consequences of a highly centralized, unitary state that from its inception in the early 19th century solved interregional conflicts by focusing power and prestige on the city. With its port of Callao and its location at the centre of Peru's Pacific coast, Lima was long the only point of contact between the nation and the outside world.

As with many sprawling and rapidly growing metropolitan centres, Lima has its detractors as well as its promoters. Those who remember the more tranquil, traditional days, before the arrival of millions of migrants and before the many buses and automobiles brought pollution and congestion, are prone to use another nickname for the capital: Lima la Horrible. This is the noisy, dirty, gloomy, damp, and depressing Lima, perceptions shared by both short-term visitors and longtime residents. Even though sunshine does break through the dense coastal cloud banks in the summer, Lima then becomes unbearably hot as well as humid, and the sunshine seems to emphasize even more clearly the grimy buildings and lack of greenery in the central city.

THE LANDSCAPE

The city site. Lima sprawls well beyond its original Spanish site at a bridgeable point on the Río Rímac. Disgorging precipitously from the high Andes, the Rímac has formed a flat-topped alluvial cone, on which the early Spanish colonists established their settlement. Since almost the entire coastal plain in central Peru consists of unconsolidated fluvioglacial deposits, cliff erosion and earthquakes are continual threats. In expanding from its original site, the city has incorporated within its fabric various hills and valleys that are also prone to earth tremors and flash floods. One of the most notable characteristics of Lima is the barren, unvegetated desert that surrounds it on all sides; the grayish-yellow sands support almost no plant or animal life, save where water has been artificially provided.

Climate. Though Lima is located at a tropical latitude, the cool offshore Peru (also called Humboldt) Current helps produce a year-round temperate climate. Average temperature ranges from 60° to 64° F (16° to 18° C) in the winter months of May to November and 70° to 80° F (21° to 27° C) in the summer months of December to April. The cooling of the coastal air mass produces thick cloud cover throughout the winter, and the *garúa* (dense sea mist) often rolls in to blanket areas of the city. Precipitation, which rarely exceeds two inches (50 millimetres) per annum, usually results from the condensation of the *garúa*. Lima is perhaps best described as cold and damp in winter and hot and humid in summer.

The *garúa*

Because clouds tend to trap airborne pollutants, Limeños can often taste the air. A permanent problem resulting from the high humidity is oxidation, rust being a common sight. Many of the wealthier citizens established winter homes on the coast north or south of the city proper or in such localities as La Molina, a short distance to the east of Lima, where the climate is free of fog and cloud.

The city layout. Lima contains a series of townscapes well-defined by its long history. The core of old Lima, delineated by Spanish colonists in the 16th century and partly enclosed by defensive walls in the 17th, retains its checkerboard street pattern. Bounded on the north by the Rímac and on the east, south, and west by broad avenues, old Lima contains a few restored colonial buildings (Torre Tagle Palace, the cathedral, and the Archbishop's Palace) interspersed among buildings of the 19th and 20th cen-

The Archbishop's Palace, with colonial-style wooden balconies, on the Plaza de Armas.

turies, many of which were built upon the sites of former colonial residences that had collapsed during the major earthquakes that have struck the city. The old walls, however, were demolished in the mid-19th century. The two principal squares (Plaza de Armas and Plaza Bolívar) still provide the foci of architectural interest within central Lima, and the enclosed wooden balconies so typical of the colonial city have now become features to be preserved or restored. The Presidential Palace (built on the site of Pizarro's house) and many other buildings reflect the past popularity of the French Empire style. On the north side of the Rímac, the old colonial suburb of the same name conserves relics of its past in its curved, narrow streets, tightly packed with single-story houses, and its Alameda de los Descalzos (Boulevard of the Barefoot Monks).

The former residential zone of central Lima has undergone several radical modifications, especially since the 1930s. Most of the old spacious mansions have been subdivided so that they now accommodate as many as 50 families. These inner-city slums (variously called *tugurios, corralones,* and *callejones*) have been occupied by immigrants from the countryside striving to gain a foothold in the urban economy and society. Sanitary conditions in such zones are often very poor.

Other parts of old Lima have experienced demolition and reconstruction. Housing has given way to banks, insurance offices, law firms, and government offices. Though there have been repeated attempts to stimulate pride in El Cercado (the formerly walled enclosure), most Limeños regard it as a place to pass through rather than to preserve and enhance. One finds little evidence of gentrification in Lima; unlike other Latin-American capitals and even other cities within Peru, central Lima contains relatively few outstanding architectural features.

Growth of the city

Lima did not expand much beyond the walls of the old city until railways and tramlines were constructed in the mid-19th century. For the next 75 years growth was steady, the axes of urban development from old Lima assuming distinctive characters: the area west to Callao became the industrial corridor; the sweeping bay frontage to the south from Barranco to Magdalena was transformed into the choice residential zone; and eastward, toward Vitarte, a mix of industrial and lower-class suburbs sprang up. As the pace of urban expansion increased in the 1930s, small communities formed in the open country between Lima and the coast. These gradually coalesced into such urban districts as La Victoria, Lince, San Isidro, and Breña. The numerous farms and small tracts of cultivated land between suburbs and barren, dry land also became urbanized as immigrants from the interior occupied these areas. In the 1950s Lima became noted for these *barriadas* (squatter camps of shanties), which as they became more permanently established were renamed *pueblos jóvenes* ("young towns"). These communities have come to contain one-third of the population of metropolitan Lima. The older *pueblo jóvenes,* such as Comas, are now difficult to distinguish from the "established" sections of the city, since the early constructions of cardboard, tin cans, and wicker matting have long since given way to bricks, cement blocks, and neat gardens.

Lima's contemporary townscapes provide such contrasts that it is easy to forget that the rich and the poor belong to the same society. Within a few blocks one can move from luxury to abject poverty. With downtown Lima often heavily congested with traffic, suburban locations were chosen for many new businesses, factories, and shopping centres. The classic corner stores run by Chinese and Japanese immigrants and their descendants are fighting a losing battle against the competition of large, hygienic supermarkets, which in turn are increasingly encircled by *ambulantes* (street vendors).

THE PEOPLE

Just as the physical fabric of Lima has been transformed since the 1930s, so too has its population. It is now difficult to identify what might be called a true Limeño, for in a very real sense Lima has become the most Peruvian of cities; everywhere one can hear different accents, reflecting the myriad origins of the *provincianos* who have made the city a microcosm of the nation. Before the arrival of the highland migrants (commonly called *serranos* or, if demonstrating what are perceived to be Indian characteristics, *cholos*), it was relatively easy to mark the difference between the white elite and other socioracial mixtures. Race, ethnicity, and class, however, now present a complexity that defies easy classification. The greatest difference that persists, and perhaps even increases, is that which divides the rich and influential from the poor and powerless. One has only to compare the elegance of those who stroll through Kennedy Park in Miraflores on a Saturday night with the squalor of those who beg in central Lima to realize that, in growing, the city has not developed. For the great majority of people access to piped water, sewage systems, inexpensive food, and steady employment are still dreams for the future.

Religion

The vast majority of Limeños are Roman Catholics, which gives the city a traditional, conservative atmosphere; this is evidenced by the enormous crowds of people who gather for such annual religious processions as El Señor de los Milagros ("the Lord of Miracles"), Santa Rosa de Lima, and San Martín de Porres. Growing numbers of residents from the slums and poor suburbs, however, have begun to question the church's positions on social and political issues, encouraged by priests who advocate what has become known as liberation theology.

THE ECONOMY

Whatever indicator is used to measure economic performance, Lima maintains a dominant position within Peru, accounting for three-fifths of the country's industrial output and nearly all of the volume of its financial transactions. The size of Lima's population makes it the premier market for all domestic and imported goods; Limeños make some four-fifths of the nation's consumer purchases each year.

Industry and commerce. Industry in Lima is located primarily in the old Callao–Lima–Vitarte corridor, with more recent additions in zones fringing the Pan-American Highway north and south of the city. Industrial activity is diverse, ranging from shipbuilding, automobile manufacturing, and oil refining to food processing and the manufacture of cement, chemicals, pharmaceuticals, plastics, textiles and clothing, and furniture. Much of this capital-intensive, heavily unionized industrial base, however, operates well below capacity, in most part because of the dire economic situation of Peru.

There has thus been a gradual de-emphasis of the more established industries, and since about 1970 a new type of informal, artisan-based industrial structure has developed. These small-scale, labour-intensive enterprises, which often are family controlled, have been better able to meet the demands of consumers by having goods more readily available (in part by avoiding bureaucratic red tape) and by offering goods for lower prices (in part by avoiding the payment of taxes).

Many industries have located within metropolitan Lima because of its pool of skilled labour, personal access to government officials, and the benefits of well-established networks of marketing and services such as banking. Manufacturing has not provided an adequate solution to the demands of the vast numbers who seek employment. One result has been the rapid rise in service jobs, the majority of which are informal in character. This type of employment has been estimated to account for at least 40 percent of total economic activity in the metropolitan area. The thousands of *ambulantes* who work the streets of central Lima have become a visual reminder of the lack of steady employment in the formal sector. One of the largest employers in Lima—directly and indirectly—is the national government. Its ministries, institutes, and other agencies provide jobs not only for an extensive bureaucracy but also for the hundreds of thousands of people who in various ways serve the needs of those fully employed.

Transportation. The railway line from Callao to Lima is the oldest in South America, while the line that climbs east past Vitarte and into the Andes reaches the highest point of any standard-gauge railway in the world. Other short lines radiate north to Paramonga and south to Lurín.

The growth of automobile transportation has given rise to the heavily congested traffic conditions that exist in contemporary Lima. Although there is now a well-developed highway system in the metropolitan area, including an expressway between central Lima and Miraflores, the vast majority of Limeños must cope with an outdated street network and rely on three basic modes of transport: *colectivos,* shared taxis that can hold up to 10 passengers; small buses that can carry up to 20 persons; and municipal buses, of which more than half normally are broken down and the other half operate in bad repair.

Because transport in Lima is at best highly inefficient and at worst chaotic, hundreds of amateur taxi drivers (*piratas*), unlicensed and often ignorant of all but the most obvious locations within the city, offer their services to the harried or unwary pedestrian at peak traffic hours. Several plans for a subway system have been proposed for Lima, in part to overcome the obvious problems of the heavily congested and polluted centre but also to interconnect the peripheral suburbs more effectively and thus divert much traffic from the central city.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. The problems of controlling Lima's growth have proved difficult, but those of municipal administration have become almost insoluble. Metropolitan Lima consists of the provinces of Lima and Callao, the latter having departmental status, which are further divided into a total of 45 political districts. Each province and each district is administratively autonomous, so that citywide planning and development can be undertaken only by means of negotiated decisions. The capital district of Lima, with its long-established expertise in urban administration, has repeatedly called for the creation of a metropolitan authority that could more efficiently confront the many issues facing the region. Local district autonomy, however, which was won only after great political effort, has become a major obstacle to any unified approach, although a municipal law enacted in 1984 created a Metropolitan Council for Greater Lima (an assembly of district mayors) as well as agencies for improving cooperation between district councils and sharing technical assistance.

Structure

The system of generating and spending revenues in metropolitan Lima provides an example of the problems of interdistrict coordination. Since 1983 each district has been able both to generate its own revenues and to utilize them as it sees fit. Thus, there has been a growing disparity in the quality of services between the wealthy districts, which can generate adequate revenues for their needs, and the poor districts, which not only generate inadequate revenues but also are in most need of such services as water, sewers, electricity, and paved streets.

The differences in income and expenditures between rich and poor districts are, to some extent, paralleled by distinctive party affiliations and voting behaviour. The poorer districts have generally supported candidates from left-wing parties, while the more affluent suburbs have supported centre-right candidates. This interparty rivalry has hampered efforts at improving cooperation between districts as well as between the municipal and national government.

Services. The rapidity and scale of Lima's growth have placed great strains upon the provision of public services. Potable water, which in the past was obtained from the Rímac and from shallow local wells, now must be brought in via lakes and diverted rivers in the high Andes. Even so, it has been predicted that rising demand in Lima will make it necessary to find new water sources by the close of the 20th century. Equally difficult has been the provision of electricity. Only with the completion in the early 1970s of the expensive hydroelectric project on the Río Mantaro in Huancavelica department has affordable power been available for Lima's industry and residential population. These new sources of water and power, however, have been at the expense of the impoverished Andean departments that have provided them; the demand for payment for their resources by these departments has threatened to further strain Lima's municipal finances.

Within the capital itself the problems of providing services have been legion. Most municipalities have had barely enough income to finance their routine operations, with nothing left over to finance new projects. In addition, municipalities that have been able to allocate money for improved services often have been unable to adequately plan and execute what usually have been complex and highly technical projects. Finally, even when these projects have been built it has seldom been possible, given the penurious state of the majority of the population, to require payment for the actual cost of the services.

Caught between the need for inner-city renewal and suburban expansion, most municipalities have turned to the national government and such international agencies as the World Bank for assistance. Their argument has been that Lima's problems have become national problems and, as such, require national solutions. The response of the national government has been to point out that if the problems of the rural poor are not solved, especially in the departments of the southern Andes, more and more of those people will move to Lima, further compounding the city's difficulties.

CULTURAL LIFE

In spite of the many and complex problems that confront those who live in Lima, it is still the dominant and most vibrant cultural centre of Peru. Those who want to study almost any subject at the advanced level must go there. Lima contains the oldest and most distinguished universities in the country—including Universidad Nacional Mayor de San Marcos de Lima (National University of San Marcos), founded in 1551, and the Pontificia Universidad Católica del Perú (Pontific Catholic University of Peru), founded in 1917—as well as numerous other schools. Nearly all of the major academies, learned societies, and research institutes are located in metropolitan Lima, as are the national cultural institutions.

The numerous museums in the metropolitan area display the richness of Peru's pre-Columbian and colonial past. Within Lima itself are the well-restored burial sites (*huacas*) of the pre-Inca coastal cultures, and south of the city stand the remains of Pachacamac, one of Peru's largest pre-Hispanic cities. Dozens of other historic sites await funds for excavation and investigation, but almost all are threatened by urban construction.

Media

Lima has several daily newspapers—*El Comercio,* founded in 1839, is the country's oldest—and numerous weekly periodicals, among which the magazine *Caretas* has become established as the newsweekly of Peru. Several television stations broadcast in colour, and some two dozen radio stations provide Lima with excellent coverage. Lima is not a city of bookstores or of book readers: the electronic media and a continual shortage of paper have combined to limit the circulation of the printed word. For the majority of lower-class Limeños the most popular reading materials are the comic books and dime novels that can be rented from street-corner stalls.

Recreation in Lima takes many forms, but perhaps no sports are more important than association football (soccer) for men and volleyball for women. Local soccer clubs have large and devoted followings. Other popular sports include horse racing, cockfighting, bullfighting, swimming, surfing, golf, tennis, and polo. Dozens of cinemas, theatre clubs, and discotheques provide nightlife, and there are scores of *peñas,* nightclubs featuring folk music. The music of Lima, as symbolized in the works of Chabuca Granda and Alicia Maguiño, is always popular, and it has enjoyed a renewed interest on the part of the public at large.

Both in the fashionable international-quality restaurants of central Lima and the bay area and in the hundreds of lesser cafés, *cevicherías,* and *picanterías* can be found a delicious variety of food. Fortunately for Lima, the migrants from other areas of Peru carried with them their highly flavoured regional dishes, making the city a gastronome's delight. Added to these foods are the excellent local beers, grape brandy (*pisco*), and inexpensive wines that are available.

One of the consequences of the massive migration to Lima has been the reinforcement of cultural ties between the capital's new urban communities and their localities

of origin. Provincial and district clubs and associations celebrate weekly with songs, dances, and foods typical of the distinctive regions. Much of Peru's folklore can be learned in the heart of Lima itself. Yet the elite and the *cholo* alike share the pleasures of the beach and the ever-popular social equalizers, beer and *ceviche,* or *cebiche* (a typical coastal dish of marinated fish).

History

PRE-COLUMBIAN AND COLONIAL PERIODS

The area around Lima has been inhabited for thousands of years. Urban communities of significant size date from the pre-Inca Early Intermediate Period (*c.* 200 BC–AD 600), the most important being Pachacamac, which was an important religious site in both pre-Inca and Inca times. Much of the ransom demanded by the conquistador Francisco Pizarro for the Inca chief Atahuallpa (Atahualpa) was obtained from Pachacamac.

Founding of Lima

The Spanish city of Lima was founded by Pizarro on Jan. 6, 1535, which, being Epiphany, prompted the name Ciudad de los Reyes ("City of Kings"). Although the name never stuck, Lima soon became the capital of the new viceroyalty of Peru, chosen over the old Inca capital of Cuzco to the southeast because the coastal location facilitated communication with Spain.

Lima developed into the centre of wealth and power for the entire viceroyalty: as the seat of the *audiencia* (high court), it administered royal justice; and, being the headquarters in the viceroyalty of the Inquisition, it pronounced on religious and moral matters. It also became the site of Peru's most prestigious associations and centres of learning, including the University of San Marcos (1551), the Peruvian Academy of Letters (1887), the National University of Engineering (1896), and the Pontific Catholic University of Peru (1917). José Hipólito Unnúe founded a medical school there in 1808. From the late 17th to the mid-19th century, however, Lima grew extremely slowly in both area and population. The city was devastated by a powerful earthquake in 1746. Although it was rebuilt in grandiose fashion, influenced heavily by the European Enlightenment, it remained politically conservative and socially stratified. Lima maintained its loyalty during the struggles for Latin American independence in the early 19th century, with Peru becoming the last mainland colony to declare its independence from Spain (July 1821).

(D.J.Ro.)

THE MODERN CITY

Lima's development into a modern city began after the completion of the Lima-Callao railroad in 1851. Interurban railway links to Miraflores, Ancón, and Chosica followed in the next 20 years and provided the opportunity for suburban growth. The small, compact, pedestrian city gradually lost its wealthier residents, who physically distanced themselves from the lower classes by building mansions in and around Miraflores. Also during that period, Lima and Callao benefited from a boom in exports of nitrate-rich guano deposits, which were collected from islands off the Peruvian coast and shipped to Europe. However, Lima's prosperity subsequently declined as political turmoil swept the nation, and, as a result of the disastrous War of the Pacific, the Chilean military looted and occupied the city (1881–83), burning the National Library in the process.

Despite the loss of the library, the city's literary scene experienced a rebirth with Ricardo Palma's series of colonial legends and stories called *Tradiciones peruanas* ("Peruvian Traditions"), which appeared between 1872 and 1910. Influential literary figures of the early 20th century included the leftist political leader and essayist José Carlos Mariátegui and the poets César Vallejo, José María Eguren, and José Santos Chocano; although many of their works focused on events outside of Lima (*e.g.,* the plight of rural Indians), they exerted a profound influence on the intelligentsia of the city—and, by extension, the nation.

A new wave of urban expansion in the 1920s and '30s was set off by the automobile and the subsequent road-building program that improved transportation not only within the capital but also between Lima and other parts of the country. For the first time, migrants could reach Lima relatively easily, and this rich, powerful, and modernizing centre became a national magnet. The consequences for Lima were drastic. From 1940 to 1980 some two million people moved to the city. Hundreds of thousands of shanties were constructed on the bare, unoccupied slopes that rose above the red-tiled roofs of the inner suburbs and on the flat desert benches that encircled Lima. Individual acts of occupying unused and unclaimed pieces of land gave way to well-planned "invasions" involving many hundreds of new city residents. So enormous became the numbers of the self-help housing units that the government finally yielded to the residents' initiatives, awarding titles to the land and trying to provide basic services. Roughly one-third of metropolitan residents lived in *pueblos jovenes* by 1990. A system of multilane expressways was built in the late 20th century to serve the city's expanding population, which had surpassed seven million by the late 1990s.

Influx of migrants and attendant problems

(D.J.Ro./Ed.)

Lima continues to influence nearly every facet of Peruvian national life—economic, political, and cultural. Since the mid-20th century, some of the more renowned works of novelist Mario Vargas Llosa have been set in Lima, including *La ciudad y los perros* (1963; "The City and the Dogs"; Eng. trans. *The Time of the Hero*) and *La tía Julia y el escribidor* (1977; *Aunt Julia and the Scriptwriter*). Among the more recent works focusing on Lima are Julio Ramón Ribeyro's tragicomic stories and Jaime Bayly's *Yo amo a mi mami* (1999; "I Love My Mom"), relating the experiences of a suburban child raised by household servants.

The city's historic centre was designated a UNESCO World Heritage site in 1988; in 1991 the site was redefined to include the former convent of San Francisco. However, Lima's historic buildings are threatened by elevated levels of air pollution from automobiles and buses, earthquakes (notably those of 1941 and 1970), and other hazards (such as a fire that destroyed the ornate municipal theatre in 1998). In the 1990s many of Lima's antique wooden balconies were repaired and restored.

BIBLIOGRAPHY. CAROLYN WALTON, *The City of Kings: A Guide to Lima* (1987), is a comprehensive guidebook. Basic information on Lima is also provided in *Lonely Planet: Peru,* 4th ed. (2000); and in *South American Handbook* (annual).

JUAN BROMLEY, *La fundación de la ciudad de los reyes* (1935); and JUAN BROMLEY and JOSÉ BARBAGELATA, *Evolución urbana de Lima* . . . (1945), provide the best introductions to the city's evolution up to the 20th century. Colonial Lima is described in MARK A. BURKHOLDER, *Politics of a Colonial Career: José Baquíjano and the Audiencia of Lima,* 2nd ed. (1990); and JOSEPHE DE MUGABURU and FRANCISCO DE MUGABURU, *Chronicle of Colonial Lima: The Diary of Josephe and Francisco Mugaburu, 1640–1697* (1975; originally published in Spanish, 1917–18). CHRISTINE HÜNEFELDT, *Paying the Price of Freedom: Family and Labor Among Lima's Slaves, 1800–1854* (1994), and *Liberalism in the Bedroom: Quarreling Spouses in Nineteenth-Century Lima* (2000), focus on gender, family relationships, and daily life.

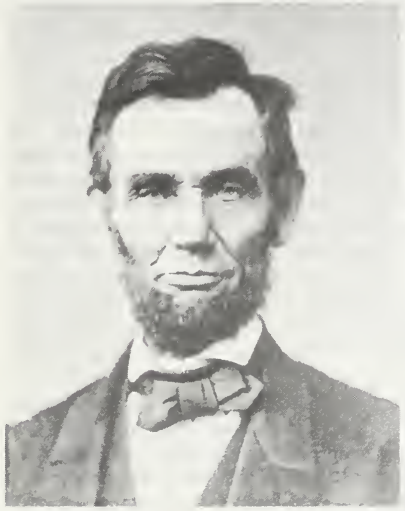
Lima's growing pains since the mid-20th century are analyzed in SUSAN LOBO, *A House of My Own: Social Organization in the Squatter Settlements of Lima, Peru* (1982, reprinted 1992); PETER LLOYD, *The "Young Towns" of Lima: Aspects of Urbanization in Peru* (1980); HERNANDO DE SOTO, *The Other Path: The Invisible Revolution in the Third World* (1989; originally published in Spanish, 1986), which is a groundbreaking study of the informal economy (*i.e.,* "black market") of Lima; and HENRY A. DIETZ, *Poverty and Problem-Solving Under Military Rule: The Urban Poor in Lima, Peru* (1980), and *Urban Poverty, Political Participation, and the State: Lima, 1970–1990* (1998). (Ed.)

Lincoln

The 16th president of the United States (1861–65), Abraham Lincoln preserved the Union during the American Civil War and brought about the emancipation of the slaves.

Among American heroes, Lincoln continues to have a unique appeal for his fellow countrymen and also for people of other lands. This charm derives from his remarkable life story—the rise from humble origins, the dramatic death—and from his distinctively human and humane personality as well as from his historical role as saviour of the Union and emancipator of the slaves. His relevance endures and grows especially because of his eloquence as a spokesman for democracy. In his view, the Union was worth saving not only for its own sake but because it embodied an ideal, the ideal of self-government. In recent years, the political side to Lincoln's character, and his racial views in particular, have come under close scrutiny, as scholars continue to find him a rich subject for research.

By courtesy of the Library of Congress, Washington, D.C.



Lincoln, 1863.

CHILDHOOD AND YOUTH

Born on February 12, 1809, in a backwoods cabin three miles south of Hodgenville, Kentucky, Lincoln was two years old when he was taken to a farm in the neighbouring valley of Knob Creek. His father, Thomas Lincoln, was the descendant of an English weaver's apprentice who had migrated to Massachusetts in 1637. On June 12, 1806, he married Nancy Hanks, who appears to have been of illegitimate birth. She has been described as "stoop-shouldered, thin-breasted, sad," and fervently religious. Thomas and Nancy Lincoln had three children: Sarah, Abraham, and Thomas, who died in infancy.

In December 1816, faced with a lawsuit challenging the title to his Kentucky farm, Thomas Lincoln moved with his family to southwestern Indiana. There, as a squatter on public land, he hastily put up a "half-faced camp"—a crude structure of logs and boughs with one side open to the weather—in which the family took shelter behind a blazing fire. Soon he built a permanent cabin, and later he bought the land on which it stood. Abraham helped to clear the fields and to take care of the crops but early acquired a dislike for hunting and fishing. The unhappiest period of his boyhood followed the death of his mother in the autumn of 1818. As a ragged nine-year-old, he saw her buried in the forest, then faced a winter without the warmth of a mother's love. Fortunately, before the onset of a second winter, Thomas Lincoln brought home from Kentucky a new wife for himself and a new mother for the children. Sarah Bush Johnston Lincoln, a widow with two girls and a boy of her own, had energy and affection to spare. She ran the household with an even hand, treating both sets of children as if she had borne them all; but she became especially fond of Abraham, and he of her. He afterward referred to her as his "angel mother."

Mother's death

His stepmother doubtless encouraged Lincoln's taste for reading, yet the original source of his desire to learn remains something of a mystery. Both his parents were almost completely illiterate, and he himself received little formal education. He once said that, as a boy, he had gone to school "by littles"—a little now and a little then—and his entire schooling amounted to no more than one year's attendance. According to his own statement, his early surroundings provided "absolutely nothing to excite ambition for education. Of course, when I came of age I did not know much. Still, somehow, I could read, write, and cipher to the rule of three; but that was all." Apparently the young Lincoln did not read a large number of books but thoroughly absorbed the few that he did read. These included Parson Weems's *Life and Memorable Actions of George Washington* (with its story of the little hatchet and the cherry tree), Daniel Defoe's *Robinson Crusoe,* John Bunyan's *Pilgrim's Progress,* and Aesop's *Fables.* From his earliest days he must have had some familiarity with the Bible, for it doubtless was the only book his family owned.

Migration to Illinois

In March 1830 the Lincoln family undertook a second migration, this time to Illinois, with Lincoln himself driving the team of oxen. Having just reached the age of 21, he was six feet four inches tall, rawboned and lanky but muscular and physically powerful. He was especially noted for the skill and strength with which he could wield an ax. He spoke with a backwoods twang and walked in the long-striding, flat-footed, cautious manner of a plowman. Good-natured though somewhat moody, talented as a mimic and storyteller, he readily attracted friends. But he was yet to demonstrate whatever other abilities he possessed.

After his arrival in Illinois Lincoln tried his hand at a variety of occupations, including rail-splitter and flatboatman. In 1825 he settled in New Salem, where he worked as a storekeeper, a postmaster, and a surveyor. With the coming of the Black Hawk War (1832), he enlisted as a volunteer and was elected captain of his company. Meanwhile, aspiring to be a legislator, he was defeated in his first try and then repeatedly reelected to the state assembly. He considered blacksmithing as a trade but finally decided in favour of the law. Already having taught himself grammar and mathematics, he began to study law books. In 1836, having passed the bar examination, he began a law practice.

PRAIRIE LAWYER

The next year he moved to Springfield, Illinois, the new state capital, which offered many more opportunities for a lawyer than New Salem did. Eventually he became a partner of William H. Herndon, who was nearly 10 years younger than Lincoln, more widely read, more emotional at the bar, and generally more extreme in his views. Yet their partnership seems to have been as nearly perfect as such human arrangements ever are. Lincoln and Herndon kept few records of their law business and split the cash between them whenever either of them was paid. It seems they had no money quarrels.

Early legal career

Within a few years of his relocation to Springfield, Lincoln was earning from $1,200 to $1,500 annually (at that time the governor of the state received a salary of only $1,200). To keep himself busy, he found it necessary not only to practice in the capital but also to follow the court as it made twice yearly rounds of its circuit through hundreds of miles of thinly settled prairie.

The coming of the railroads, especially after 1850, made

travel easier and practice more remunerative. Lincoln served as a lobbyist for the Illinois Central Railroad, assisting it in getting a charter from the state, and thereafter he was a regular attorney for the company. He also handled cases for other railroads and for banks, insurance companies, and mercantile and manufacturing firms. His business included a number of patent suits and criminal trials. One of his most effective and famous pleas had to do with a murder case. A witness claimed that, by the light of the moon, he had seen Duff Armstrong, an acquaintance of Lincoln's, take part in a killing. Referring to an almanac for proof, Lincoln argued that the night had been too dark for the witness to have seen anything clearly, and with a sincere and moving appeal he won an acquittal.

By the time he began to be prominent in national politics, about 20 years after launching his legal career, Lincoln had made himself one of the most distinguished and successful lawyers in Illinois. He was noted not only for his shrewdness and practical common sense, which enabled him always to see to the heart of any legal case, but also for his invariable fairness and utter honesty.

PRIVATE LIFE

While residing in New Salem, Lincoln became acquainted with Ann Rutledge. Apparently he was fond of her, and certainly he grieved with the entire community at her untimely death, in 1835, at the age of 22. Afterward, stories were told of a grand romance between Lincoln and Rutledge, but these stories are not supported by sound historical evidence. A year after Rutledge's death, Lincoln carried on a halfhearted courtship with Mary Owens, who eventually concluded that he was "deficient in those little links which make up the chain of woman's happiness." She turned down his proposal.

Marriage to Mary Todd

So far as can be known, the first and only real love of Lincoln's life was Mary Todd. High-spirited, quick-witted, and well-educated, Todd came from a rather distinguished Kentucky family, and her Springfield relatives belonged to the social aristocracy of the town. Some of them frowned upon her association with Lincoln, and from time to time he too doubted that he could ever make her happy. Nevertheless, they became engaged. Then, on a day in 1841 that Lincoln recalled as the "fatal first of January," the engagement was broken, apparently on his initiative. For some time after that, Lincoln was overwhelmed by terrible depression and despondency. Finally the two were reconciled, and on November 4, 1842, they married.

Four children, all boys, were born to the Lincolns. Only the eldest, Robert Todd, survived to adulthood, though Lincoln's favourite, Thomas ("Tad"), who had a cleft palate and a lisp, outlived his father. Lincoln left the upbringing of his children largely to their mother, who was alternately strict and lenient in her treatment of them.

The Lincolns had a mutual affectionate interest in the doings and welfare of their boys, were fond of one another's company, and missed each other when apart, as existing letters show. Like most married couples, they also had domestic quarrels, which undoubtedly were exaggerated by contemporary gossips. She suffered from recurring headaches, fits of temper, and a sense of insecurity and loneliness that was intensified by her husband's long absences on the lawyer's circuit. After his election to the presidency, she was afflicted by the death of her son William ("Willie"), by the ironies of a war that made enemies of Kentucky relatives and friends, and by the unfair public criticisms of her as mistress of the White House. She developed an obsessive need to spend money, and she ran up embarrassing bills. She also staged some painful scenes of wifely jealousy. At last, in 1875, she was officially declared insane, though by that time she had undergone the shock of seeing her husband murdered at her side. During their earlier married life, she unquestionably encouraged her husband and served as a prod to his own ambition. During their later years together, she probably strengthened and tested his innate qualities of tolerance and patience.

Religious views

With his wife, Lincoln attended Presbyterian services in Springfield and in Washington but never joined any church. Early in life Lincoln had been something of a skeptic and freethinker, and his reputation had been such that, as he once complained, the "church influence" was used against him in politics. When running for Congress in 1846, he issued a handbill to deny that he ever had "spoken with intentional disrespect of religion." He went on to explain that he had believed in the doctrine of necessity—"that is, that the human mind is impelled to action, or held in rest by some power over which the mind itself has no control." Throughout his life he also believed in dreams and other enigmatic signs and portents. As he grew older, and especially after he became president and faced the soul-troubling responsibilities of the Civil War, he developed a profound religious sense, and he increasingly personified necessity as God. He came to look upon himself quite humbly as an "instrument of Providence" and to view all history as God's enterprise.

Lincoln was fond of the Bible and knew it well. He also was fond of Shakespeare, and in private conversation he used many Shakespearean allusions, discussed problems of dramatic interpretation with considerable insight, and recited long passages from memory with rare feeling and understanding.

EARLY POLITICS

When Lincoln first entered politics, Andrew Jackson was president. Lincoln shared the sympathies that the Jacksonians professed for the common man, but he disagreed with the Jacksonian view that the government should be divorced from economic enterprise. "The legitimate object of government," he was later to say, "is to do for a community of people whatever they need to have done, but cannot do at all, or cannot do so well, for themselves, in their separate and individual capacities." Among the prominent politicians of his time, he most admired Henry Clay and Daniel Webster. Clay and Webster advocated using the powers of the federal government to encourage business and develop the country's resources by means of a national bank, a protective tariff, and a program of internal improvements for facilitating transportation. In Lincoln's view, Illinois and the West as a whole desperately needed such aid for economic development. From the outset, he associated himself with the party of Clay and Webster, the Whigs.

Illinois state legislator

As a Whig member of the Illinois State Legislature, to which he was elected four times from 1834 to 1840, Lincoln devoted himself to a grandiose project for constructing with state funds a network of railroads, highways, and canals. Whigs and Democrats joined in passing an omnibus bill for these undertakings, but the panic of 1837 and the ensuing business depression brought about the abandonment of most of them.

While in the legislature he demonstrated that, though opposed to slavery, he was no abolitionist. In 1837, in response to the mob murder of Elijah Lovejoy, an antislavery newspaperman of Alton, the legislature introduced resolutions condemning abolitionist societies and defending slavery within the Southern states as "sacred" by virtue of the federal Constitution. Lincoln refused to vote for the resolutions. Together with a fellow member, he drew up a protest that declared, on the one hand, that slavery was "founded on both injustice and bad policy" and, on the other, that "the promulgation of abolition doctrines tends rather to increase than to abate its evils."

During his single term in Congress (1847–49), Lincoln, as the lone Whig from Illinois, gave little attention to legislative matters. He proposed a bill for the gradual and compensated emancipation of slaves in the District of Columbia, but, because it was to take effect only with the approval of the "free white citizens" of the district, it displeased abolitionists as well as slaveholders and never was seriously considered.

Lincoln devoted much of his time to presidential politics—to unmaking one president, a Democrat, and making another, a Whig. He found an issue and a candidate in the Mexican War. With his "spot resolutions," he challenged the statement of President James K. Polk that Mexico had started the war by shedding American blood upon American soil. Along with other members of his party, Lincoln voted to condemn Polk and the war while also voting for

supplies to carry it on. At the same time, he laboured for the nomination and election of the war hero Zachary Taylor. After Taylor's success at the polls, Lincoln expected to be named commissioner of the general land office as a reward for his campaign services, and he was bitterly disappointed when he failed to get the job. His criticisms of the war, meanwhile, had not been popular among the voters in his own congressional district. At the age of 40, frustrated in politics, he seemed to be at the end of his public career.

THE ROAD TO THE PRESIDENCY

For about five years Lincoln took little part in politics, and then a new sectional crisis gave him a chance to reemerge and rise to statesmanship. In 1854 his political rival Stephen A. Douglas maneuvered through Congress a bill for reopening the entire Louisiana Purchase to slavery and allowing the settlers of Kansas and Nebraska (with "popular sovereignty") to decide for themselves whether to permit slaveholding in those territories. The Kansas-Nebraska Act provoked violent opposition in Illinois and the other states of the old Northwest. It gave rise to the Republican Party while speeding the Whig Party on its way to disintegration. Along with many thousands of other homeless Whigs, Lincoln soon became a Republican (1856).

Lincoln–Douglas debates

Lincoln challenged the incumbent Douglas for the Senate seat in 1858, and the series of debates they engaged in throughout Illinois was political oratory of the highest order. Both men were shrewd debaters and accomplished stump speakers, though they could hardly have been more different in style and appearance—the short and pudgy Douglas, whose stentorian voice and graceful gestures swayed audiences, and the tall, homely, almost emaciated-looking Lincoln, who moved awkwardly and whose voice was piercing and shrill. Lincoln's prose and speeches, however, were eloquent, pithy, powerful, and free of the verbosity so common in his day. The debates were published in 1860, together with a biography of Lincoln, in a best-selling book that Lincoln himself compiled and marketed as part of his campaign.

In their basic views, Lincoln and Douglas were not as far apart as they seemed in the heat of political argument. Neither was abolitionist or proslavery. But Lincoln, unlike Douglas, insisted that Congress must exclude slavery from the territories. He disagreed with Douglas's belief that the territories were by nature unsuited to the slave economy and that no congressional legislation was needed to prevent the spread of slavery into them. In one of his most famous speeches he said: "A house divided against itself cannot stand. I believe the government cannot endure permanently half slave and half free." He predicted that the country eventually would become "all one thing, or all the other." He agreed with Thomas Jefferson and other founding fathers, however, that slavery should be merely contained, not directly attacked. In fact, when politically expedient, he reassured his audiences that he did not endorse citizenship for Negroes or believe in the equality of the races. "I am not, nor ever have been, in favour of bringing about in any way the social and political equality of the white and black races," he told a crowd in Charleston, Illinois. "I am not nor ever have been in favour of making voters or jurors of Negroes, nor of qualifying them to hold office, nor to intermarry with white people." There is, he added, "a physical difference between the white and black races which I believe will forever forbid the two races living together on terms of social and political equality."

In the end, Lincoln lost the election to Douglas. Although the outcome did not surprise him, it depressed him deeply. Lincoln had, nevertheless, gained national recognition and soon began to be mentioned as a presidential prospect for 1860.

Election as president

On May 18, 1860, after Lincoln and his friends had made skillful preparations, he was nominated on the third ballot at the Republican National Convention in Chicago. He then put aside his law practice and, though making no stump speeches, gave full time to the direction of his campaign. With the Republicans united, the Democrats divided, and a total of four candidates in the field, he carried the election on November 6. Although he received no votes from the Deep South and only 40 out of 100 in the country as a whole, the popular votes were so distributed that he won a clear and decisive majority in the electoral college.

PRESIDENT LINCOLN

After Lincoln's election and before his inauguration, the state of South Carolina proclaimed its withdrawal from the Union. To forestall similar action by other Southern states, various compromises were proposed in Congress. The most important, the Crittenden Compromise, included constitutional amendments guaranteeing slavery forever in the states where it already existed and dividing the territories between slavery and freedom. Although Lincoln had no objection to the first of these amendments, he was unalterably opposed to the second, and indeed to any scheme infringing in the slightest upon the free-soil plank of his party's platform. He feared that a territorial division, by sanctioning the principle of slavery extension, would only encourage planter imperialists to seek new slave territory south of the American border and thus would "put us again on the highroad to a slave empire." From his home in Springfield he advised Republicans in Congress to vote against a division of the territories, and the proposal was killed in committee. Six additional states then seceded and, with South Carolina, combined to form the Confederate States of America.

Secession of Confederate states

Thus, before Lincoln had even moved into the White House, a disunion crisis was upon the country. Attention, North and South, focused upon Fort Sumter, in Charleston Harbor, South Carolina. This fort, still under construction, was garrisoned by U.S. troops under Major Robert Anderson. The Confederacy claimed it and, from other harbour fortifications, threatened it. Foreseeing trouble, Lincoln, while still in Springfield, confidentially requested Winfield Scott, general in chief of the U.S. Army, to be prepared "to either hold, or retake, the forts, as the case may require, at, and after the inauguration." In his inaugural address (March 4, 1861), besides upholding the Union's indestructibility and appealing for sectional harmony, Lincoln restated his Sumter policy as follows:

> The power confided to me, will be used to hold, occupy, and possess the property, and places belonging to the government, and to collect the duties and imposts; but beyond what may be necessary for these objects, there will be no invasion—no using of force against, or among the people anywhere.

Then, near the end, addressing the absent Southerners: "You can have no conflict, without being yourselves the aggressors."

Outbreak of war. No sooner was he in office than Lincoln received word that the Sumter garrison, unless supplied or withdrawn, would shortly be starved out. Still, for about a month, Lincoln delayed acting. He was beset by contradictory advice. General Scott, Secretary of State William H. Seward, and others urged him to abandon the fort; and Seward, through a go-between, gave a group of Confederate commissioners to understand that the fort would in fact be abandoned. But many Republicans insisted that any show of weakness would bring disaster to their party and to the Union. Finally, Lincoln ordered the preparation of two relief expeditions, one for Fort Sumter and the other for Fort Pickens, in Florida. (He afterward said he would have been willing to withdraw from Sumter if he could have been sure of holding Pickens.) Before the Sumter expedition, he sent a messenger to tell the South Carolina governor:

> I am directed by the President of the United States to notify you to expect an attempt will be made to supply Fort-Sumpter [sic] with provisions only; and that, if such attempt be not resisted, no effort to throw in men, arms, or ammunition, will be made, without further notice, or in case of an attack upon the Fort.

Without waiting for the arrival of Lincoln's expedition, the Confederate authorities presented to Major Anderson a demand for Sumter's prompt evacuation, which he refused. On April 12, 1861, at dawn, the Confederate batteries in the harbour opened fire.

Attack on Fort Sumter

"Then, and thereby," Lincoln informed Congress when it met on July 4, "the assailants of the Government, began the conflict of arms." The Confederates, however, accused him of being the real aggressor. They said he had cleverly

maneuvered them into firing the first shot so as to put upon them the onus of war guilt. Although some historians have repeated this charge, it appears to be a gross distortion of the facts. Lincoln was determined to preserve the Union, and to do so he thought he must take a stand against the Confederacy. He concluded he might as well take this stand at Sumter.

Lincoln's primary aim was neither to provoke war nor to maintain peace. In preserving the Union, he would have been glad to preserve the peace also, but he was ready to risk a war that he thought would be short.

After the firing on Fort Sumter, Lincoln called upon the state governors for troops (Virginia and three other states of the upper South responded by joining the Confederacy). He then proclaimed a blockade of the Southern ports. These steps—the Sumter expedition, the call for volunteers, and the blockade—were the first important decisions of Lincoln as commander in chief of the army and navy. But he still needed a strategic plan and a command system for carrying it out.

General Scott advised him to avoid battle with the Confederate forces in Virginia, to get control of the Mississippi River, and by tightening the blockade to hold the South in a gigantic squeeze. Lincoln had little confidence in Scott's comparatively passive and bloodless "Anaconda" plan. He believed the war must be actively fought if it ever was to be won. Overruling Scott, he ordered a direct advance on the Virginia front, which resulted in defeat and rout for the federal forces at Bull Run (July 21, 1861).

Strategy as commander

After a succession of more or less sleepless nights, Lincoln produced a set of memorandums on military policy. His basic thought was that the armies should advance concurrently on several fronts and should move so as to hold and use the support of Unionists in Missouri, Kentucky, western Virginia, and eastern Tennessee. As he later explained:

> I state my general idea of this war to be that we have the greater numbers, and the enemy has the greater facility of concentrating forces upon points of collision; that we must fail, unless we can find some way of making our advantage an over-match for his; and that this can only be done by menacing him with superior forces at different points, at the same time.

This, with the naval blockade, comprised the essence of Lincoln's strategy.

Leadership in war. As a war leader, Lincoln employed the style that had served him as a politician—a description of himself, incidentally, that he was not ashamed to accept. He preferred to react to problems and to the circumstances that others had created rather than to originate policies and lay out long-range designs. In candour he would write: "I claim not to have controlled events, but confess plainly that events have controlled me." His guiding rule was: "My policy is to have no policy." He was not unprincipled, but he was a practical man, mentally nimble and flexible, and if one action or decision proved unsatisfactory in practice he was willing to experiment with another.

From 1861 to 1864, while hesitating to impose his ideas upon his generals, Lincoln experimented with command personnel and organization. Accepting the resignation of Scott (November 1861), he put George B. McClellan in charge of the armies as a whole. After a few months, disgusted by the slowness of McClellan, he demoted him to the command of the Army of the Potomac alone. He then tried a succession of commanders for the army in Virginia but was disappointed with each of them in turn. Meanwhile, he had in Henry W. Halleck a general in chief who shrank from making important decisions. For nearly two years the Federal armies lacked effective unity of command. Lincoln, besides transmitting official orders through Halleck, also communicated directly with the generals, sending personal suggestions in his own name. To generals opposing Robert E. Lee, he suggested that the object was to destroy Lee's army, not to capture Richmond or to drive the invader from Northern soil.

Finally Lincoln looked to the West for a top general. He admired the Vicksburg Campaign of Ulysses S. Grant in Mississippi, and, nine days after the Vicksburg surrender (which occurred on July 4, 1863), he sent Grant a "grateful acknowledgment for the almost inestimable service" he had done the country. In March 1864 Lincoln promoted Grant to lieutenant general and gave him command of all the federal armies. At last Lincoln had found a man who, with such able subordinates as William T. Sherman, Philip Sheridan, and George H. Thomas, could put into effect those parts of Lincoln's concept of a large-scale, coordinated offensive that still remained to be carried out. Grant was only a member, though an important one, of a top-command arrangement that Lincoln eventually had devised. Overseeing everything was Lincoln himself, the commander in chief. Taking the responsibility for men and supplies was Secretary of War Edwin M. Stanton. Serving as a presidential adviser and as a liaison with military men was Halleck, the chief of staff. And directing all the armies, while accompanying Meade's Army of the Potomac, was Grant, the general in chief.

Lincoln combined statecraft and the overall direction of armies with an effectiveness that increased year by year. His achievement is all the more remarkable in view of his lack of training and experience in the art of warfare. This lack may have been an advantage as well as a handicap. Unhampered by outworn military dogma, Lincoln could all the better apply his practical insight and common sense—some would say his military genius—to the winning of the Civil War.

Lincoln and slavery

There can be no doubt of Lincoln's deep and sincere devotion to the cause of personal freedom. Before his election to the presidency he had spoken often and eloquently on the subject. In 1854, for example, he said he hated the Douglas attitude of indifference toward the possible spread of slavery to new areas. "I hate it because of the monstrous injustice of slavery itself," he declared. "I hate it because it deprives our republican example of its just influence in the world; enables the enemies of free institutions with plausibility to taunt us as hypocrites."

Yet, as president, Lincoln was at first reluctant to adopt an abolitionist policy. There were several reasons for his hesitancy. He had been elected on a platform pledging no interference with slavery within the states, and in any case he doubted the constitutionality of federal action under the circumstances. He was concerned about the possible difficulties of incorporating nearly four million Negroes, once they had been freed, into the nation's social and political life. Above all, he felt that he must hold the border slave states in the Union, and he feared that an abolitionist program might impel them, in particular his native Kentucky, toward the Confederacy. So he held back while others went ahead. When General John C. Frémont and General David Hunter, within their respective military departments, proclaimed freedom for the slaves of disloyal masters, Lincoln revoked the proclamations. When Congress passed confiscation acts in 1861 and 1862, he refrained from a full enforcement of the provisions authorizing him to seize slave property. And when Horace Greeley in the *New York Tribune* appealed to him to enforce these laws, Lincoln patiently replied (August 22, 1862):

> My paramount object in this struggle is to save the Union, and is not either to save or to destroy slavery. If I could save the Union without freeing any slave I would do it; and if I could save it by freeing all the slaves I would do it; and if I could save it by freeing some and leaving others alone, I would also do that.

Meanwhile, in response to rising antislavery sentiment, Lincoln came forth with an emancipation plan of his own. According to his proposal, the slaves were to be freed by state action, the slaveholders were to be compensated, the federal government was to share the financial burden, the emancipation process was to be gradual, and the freedmen were to be colonized abroad. Congress indicated its willingness to vote the necessary funds for the Lincoln plan, but none of the border slave states were willing to launch it, and in any case few Negro leaders desired to see their people sent abroad.

While still hoping for the eventual success of his gradual plan, Lincoln took quite a different step by issuing his preliminary (September 22, 1862) and his final (January 1, 1863) Emancipation Proclamation. This famous decree, which he justified as an exercise of the president's war powers, applied only to those parts of the country actually under Confederate control, not to the loyal slave states nor to the federally occupied areas of the Confederacy. Direct-

Emancipation Proclamation

ly or indirectly, the proclamation brought freedom during the war to fewer than 200,000 slaves. Yet it had great significance as a symbol. It indicated that the Lincoln government had added freedom to reunion as a war aim, and it attracted liberal opinion in England and Europe to increased support of the Union cause.

The Thirteenth Amendment

Lincoln himself doubted the constitutionality of his step, except as a temporary war measure. After the war, the slaves freed by the proclamation would have risked re-enslavement had nothing else been done to confirm their liberty. But something else was done: the Thirteenth Amendment was added to the Constitution, and Lincoln played a large part in bringing about this change in the fundamental law. Through the chairman of the Republican National Committee he urged the party to include a plank for such an amendment in its platform of 1864. The plank, as adopted, stated that slavery was the cause of the rebellion, that the president's proclamation had aimed "a death blow at this gigantic evil," and that a constitutional amendment was necessary to "terminate and forever prohibit" it. When Lincoln was reelected on this platform and the Republican majority in Congress was increased, he was justified in feeling, as he apparently did, that he had a mandate from the people for the Thirteenth Amendment. The newly chosen Congress, with its overwhelming Republican majority, was not to meet until after the lame duck session of the old Congress during the winter of 1864–65. Lincoln did not wait. Using his resources of patronage and persuasion upon certain of the Democrats, he managed to get the necessary two-thirds vote before the session's end. He rejoiced as the amendment went out to the states for ratification, and he rejoiced again and again as his own Illinois led off and other states followed one by one in acting favourably upon it. (He did not live to rejoice in its ultimate adoption.)

Lincoln deserves his reputation as the Great Emancipator. His claim to that honour, if it rests uncertainly upon his famous proclamation, has a sound basis in the support he gave to the antislavery amendment. It is well founded also in his greatness as the war leader who carried the nation safely through the four-year struggle that brought freedom in its train. And, finally, it is strengthened by the practical demonstrations he gave of respect for human worth and dignity, regardless of colour. During the last two years of his life he welcomed Negroes as visitors and friends in a way no president had done before. One of his friends was the distinguished former slave Frederick Douglass, who wrote: "In all my interviews with Mr. Lincoln I was impressed with his entire freedom from prejudice against the colored race."

Wartime politics. To win the war, President Lincoln had to have popular support. The reunion of North and South required, first of all, a certain degree of unity in the North. But the North contained various groups with special interests of their own. Lincoln faced the task of attracting to his administration the support of as many divergent groups and individuals as possible. Fortunately for the Union cause, he was a president with rare political skill. He had the knack of appealing to fellow politicians and talking to them in their own language. He had a talent for smoothing over personal differences and holding the loyalty of men antagonistic to one another. Inheriting the spoils system, he made good use of it, disposing of government jobs so as to strengthen his administration and further its official aims.

The opposition party remained alive and strong. Its membership included war Democrats and peace Democrats, often called "Copperheads," a few of whom collaborated with the enemy. Lincoln did what he could to cultivate the assistance of the war Democrats, as in securing from Congress the timely approval of the Thirteenth Amendment. So far as feasible, he conciliated the peace Democrats. In dealing with persons suspected of treasonable intent, Lincoln at times authorized his generals to make arbitrary arrests. He justified this action on the ground that he had to allow some temporary sacrifice of parts of the Constitution in order to maintain the Union and thus preserve the Constitution as a whole. He let his generals suspend several newspapers, but only for short periods, and he promptly revoked a military order suppressing the hostile *Chicago Times*.

Considering the dangers and provocations of the time, Lincoln was quite liberal in his treatment of political opponents and the opposition press. He was by no means the dictator critics often accused him of being. Nevertheless, his abrogating of civil liberties, especially his suspension of the privilege of the writ of habeas corpus, disturbed Democrats, Republicans, and even members of his own cabinet. In the opinion of a soldier from Massachusetts, the president, "without the people having any legal means to prevent it, is only prevented from exercising a Russian despotism by the fear he may have of shocking too much the sense of decency of the whole world." Even Lincoln's friend Orville Hickman Browning believed the arrests ordered by the president were "illegal and arbitrary, and did more harm than good, weakening instead of strengthening the government." Yet Lincoln defended his actions, arguing that the Constitution provided for the suspension of such liberties "in cases of Rebellion or Invasion, [when] the public Safety may require it." Moreover, posed Lincoln with rhetorical flare, "Must I shoot a simpleminded soldier boy who deserts" and "not touch a hair of a wilely agitator who induces him to desert?"

Abrogation of civil liberties

Within his own party, Lincoln confronted factional divisions and personal rivalries that caused him as much trouble as did the activities of the Democrats, though he and most of his fellow partisans agreed fairly well upon their principal economic aims. With his approval, the Republicans enacted into law the essentials of the program he had advocated from his early Whig days—a protective tariff; a national banking system; and federal aid for internal improvements, in particular for the construction of a railroad to the Pacific Coast. The Republicans disagreed among themselves, however, on many matters regarding the conduct and purposes of the war. Two main factions arose: the "Radicals" and the "Conservatives." Lincoln himself inclined in spirit toward the Conservatives, but he had friends among the Radicals as well, and he strove to maintain his leadership over both. In appointing his cabinet, he chose his several rivals for the 1860 nomination and, all together, gave representation to every important party group. Wisely he included the outstanding Conservative, Seward, and the outstanding Radical, Salmon P. Chase. Cleverly he overcame cabinet crises and kept these two opposites among his official advisers until Chase's resignation in 1864.

Lincoln had to deal with even more serious factional uprisings in Congress. The big issue was the "reconstruction" of the South. The seceded states of Louisiana, Arkansas, and Tennessee having been largely recovered by the federal armies, Lincoln late in 1863 proposed his "ten percent plan," according to which new state governments might be formed when 10 percent of the qualified voters had taken an oath of future loyalty to the United States. The Radicals rejected Lincoln's proposal as too lenient, and they carried through Congress the Wade-Davis Bill, which would have permitted the remaking and readmission of states only after a majority had taken the loyalty oath. When Lincoln pocket-vetoed that bill, its authors published a "manifesto" denouncing him.

Reconstruction

Lincoln was already the candidate of the "Union" (that is, the Republican) party for reelection to the presidency, and the Wade-Davis manifesto signalized a movement within the party to displace him as the party's nominee. But even after the movement collapsed, the party remained badly divided. A rival Republican candidate, John C. Frémont, nominated much earlier by a splinter group, was still in the field. Leading Radicals promised to procure Frémont's withdrawal if Lincoln would obtain the resignation of his conservative postmaster general, Montgomery Blair. Eventually Frémont withdrew and Blair resigned. The party was reunited in time for the election of 1864.

In 1864, as in 1860, Lincoln was the chief strategist of his own electoral campaign. He took a hand in the management of the Republican Speakers' Bureau, advised state committees on campaign tactics, hired and fired government employees to strengthen party support, and did his best to enable as many soldiers and sailors as possible to

vote. Most of the citizens in uniform voted Republican. He was reelected with a large popular majority (55 percent) over his Democratic opponent, General George B. McClellan.

In 1864 the Democratic platform called for an armistice and a peace conference, and prominent Republicans as well as Democrats demanded that Lincoln heed Confederate peace offers, irregular and illusory though they were. In a public letter, he stated his own conditions:

> Any proposition which embraces the restoration of peace, the integrity of the whole Union, and the abandonment of slavery, and which comes by and with an authority that can control the armies now at war against the United states will be received and considered by the Executive government of the United States, and will be met by liberal terms on other substantial and collateral points.

When Conservatives protested to him against the implication that the war must go on to free the slaves, even after reunion had been won, he explained, "To me it seems plain that saying reunion and abandonment of slavery would be considered, if offered, is not saying that nothing else or less would be considered, if offered." After his reelection, in his annual message to Congress, he said, "In stating a single condition of peace, I mean simply to say that the war will cease on the part of the government, whenever it shall have ceased on the part of those who began it." On February 3, 1865, he met personally with Confederate commissioners on a steamship in Hampton Roads, Virginia. He promised to be liberal with pardons if the South would quit the war, but he insisted on reunion as a precondition for any peace arrangement. In his second inaugural address he embodied the spirit of his policy in the famous words "with malice toward none; with charity for all." His terms satisfied neither the Confederate leaders nor the Radical Republicans, and so no peace was possible until the final defeat of the Confederacy.

Postwar policy. At the end of the war, Lincoln's policy for the defeated South was not clear in all its details, though he continued to believe that the main object should be to restore the "seceded States, so-called," to their "proper practical relation" with the Union as soon as possible. He possessed no fixed and uniform program for the region as a whole. With respect to states like Louisiana and Tennessee, he continued to urge acceptance of new governments set up under his 10 percent plan during the war. With respect to states like Virginia and North Carolina, he seemed willing to use the old rebel governments temporarily as a means of transition from war to peace. He was on record as opposing the appointment of "strangers" (carpetbaggers) to govern the South. A program of education for the freedmen, he thought, was essential to preparing them for their new status. He also suggested that the vote be given immediately to some Negroes—"as, for instance, the very intelligent, and especially those who have fought gallantly in our ranks."

On the question of reconstruction, however, Lincoln and the extremists of his own party stood even farther apart in early 1865 than a year before. Some of the Radicals were beginning to demand a period of military occupation for the South, the confiscation of planter estates and their division among the freedmen, and the transfer of political power from the planters to their former slaves. In April 1865 Lincoln began to modify his own stand in some respects and thus to narrow the gap between himself and the Radicals. He recalled the permission he had given for the assembling of the rebel legislature of Virginia, and he approved in principle—or at least did not disapprove—Stanton's scheme for the military occupation of Southern states. After the cabinet meeting of April 14, Attorney General James Speed inferred that Lincoln was moving toward the Radical position. What Lincoln's reconstruction policy would have been if he had lived to complete his second term can only be guessed at.

Assassination

On the evening of April 14, 1865, 26-year-old John Wilkes Booth—a rabid advocate of slavery with ties to the South and the flamboyant son of one of the most distinguished theatrical families of the 19th century—shot Lincoln as he sat in Ford's Theatre in Washington. Early the next morning Lincoln died. (R.N.C./Ed.)

REPUTATION AND CHARACTER

"Now he belongs to the ages," Stanton is supposed to have said as Lincoln took his last breath. Many thought of Lincoln as a martyr. The assassination had occurred on Good Friday, and on the following Sunday, memorable as "Black Easter," hundreds of speakers found a sermon in the event. Some of them saw more than mere chance in the fact that assassination day was also crucifixion day. One declared, "Jesus Christ died for the world; Abraham Lincoln died for his country." Thus the posthumous growth of his reputation was influenced by the timing and circumstances of his death, which won for him a kind of sainthood.

Among the many who remembered Lincoln from personal acquaintance, William Herndon, his former law partner, was sure he had known him more intimately than any of the rest and influenced the world's conception of him more than all the others put together. When Lincoln died, Herndon began a new career as Lincoln authority, collecting reminiscences wherever he could find them and adding his own store of memories. Although admiring Lincoln, he objected to the trend toward sanctifying him. He saw, as the main feature of Lincoln's life, the far more than ordinary rise of a self-made man, a rise from the lowest depths to the greatest heights. To emphasize this point, Herndon gave his most eager attention to evidence of the dismal and sordid in Lincoln's background. An extremely significant event in Lincoln's development, as Herndon viewed it, was a "romance of much reality" with Ann Rutledge. Lincoln loved no one but Rutledge and, after her death, never ceased to grieve for her. His memory of her both saddened and inspired him. As for Mary Todd, she married Lincoln out of spite, then devoted herself to making him miserable. So Herndon would have it, and after him countless biographers, novelists, and playwrights elaborated upon his views, which persist as accepted knowledge about Lincoln despite their refutation by historical scholarship.

The myth of Lincoln

Lincoln has become a myth as well as a man. The Lincoln of legend has grown into a protean god who can assume a shape to please almost anyone. He is Old Abe and at the same time a natural gentleman. He is Honest Abe and yet a being of superhuman shrewdness and cunning. He is also Father Abraham, the wielder of authority, the support of the weak; and he is an equal, a neighbour, and a friend. But there is a malevolent Lincoln as well, and to many Southerners from the time of the Civil War and to some conservative critics today, Lincoln is the wicked slayer of liberty and states' rights and the father of the all-controlling national state.

Lincoln's reputation began to grow while he was still alive. In the midst of the Civil War, for instance, the *Washington Chronicle* found a resemblance between him and George Washington in their "sure judgment," "perfect balance of thoroughly sound faculties," and "great calmness of temper, great firmness of purpose, supreme moral principle, and intense patriotism."

Lincoln's best ideas and finest phrases were considered and written and rewritten with meticulous revisions. Some resulted from a slow gestation of thought and phrase through many years. One of his themes—probably his central theme—was the promise and the problem of self-government. As early as 1838, speaking to the Young Men's Lyceum of Springfield on "The Perpetuation of Our Political Institutions," he recalled the devotion of his Revolutionary forefathers to the cause and went on to say:

> Their ambition aspired to display before an admiring world, a practical demonstration of the truth of a proposition, which had hitherto been considered, at best no better, than problematical; namely, the capability of a people to govern themselves.

Again and again he returned to this idea, especially after the coming of the Civil War, and he steadily improved his phrasing. Finally at Gettysburg, Pennsylvania, he made the culminating, supreme statement, concluding with the words:

> . . . that from these honored dead we take increased devotion to that cause for which they gave the last full measure of devotion—that we here highly resolve that these dead shall not have died in vain—that this nation, under God, shall have a new birth of freedom—and that government of the people, by the people, for the people, shall not perish from the earth.

BIBLIOGRAPHY. A guide for the general reader is PAUL M. ANGLE, *A Shelf of Lincoln Books: A Critical, Selective Bibliography of Lincolniana* (1946, reissued 1972). Practically all the known writings of Lincoln himself are available in *The Collected Works of Abraham Lincoln,* ed. by ROY P. BASLER, 9 vol. (1953–55), with two supplements (1974, 1990). A judicious selection from these volumes is reprinted in *The Living Lincoln,* ed. by PAUL M. ANGLE and EARL SCHENK MIERS (1955, reissued 1992). *Lincoln on Democracy,* ed. by MARIO M. CUOMO and HAROLD HOLZER (1990), contains Lincoln's writings on this subject. THOMAS S. SCHWARTZ (ed.), *For a Vast Future Also: Essays from the Journal of the Abraham Lincoln Association* (1999), includes essays on emancipation and Lincoln's legacy.

Classic multivolume biographies are JOHN G. NICOLAY and JOHN HAY, *Abraham Lincoln: A History,* 10 vol. (1890, reissued 1917), also available in an abridged ed. edited by PAUL M. ANGLE, 1 vol. (1966); ALBERT BEVERIDGE, *Abraham Lincoln, 1809–1858,* 2 vol. (1928, reissued 1971); CARL SANDBURG, *Abraham Lincoln: The Prairie Years,* 2 vol. (1926), and *Abraham Lincoln: The War Years,* 4 vol. (1939), both reissued together in 1 vol. (1984); and J.G. RANDALL, *Lincoln, the President,* 4 vol. (1945–55). Indispensable for the politics of the 1850s is ALLAN NEVINS, *The Emergence of Lincoln,* 2 vol. (1950). One-volume biographies include BENJAMIN P. THOMAS, *Abraham Lincoln* (1952, reissued 1986); STEPHEN B. OATES, *With Malice Toward None* (1977, reissued 1985), and *Abraham Lincoln, the Man Behind the Myths* (1984); OSCAR HANDLIN and LILIAN HANDLIN, *Abraham Lincoln and the Union* (1980); PHILIP B. KUNHARDT, JR., PHILIP B. KUNHARDT III, and PETER W. KUNHARDT, *Lincoln* (1992), containing 900 pictures; MICHAEL BURLINGAME, *The Inner World of Abraham Lincoln* (1994), a psychobiography; DAVID HERBERT DONALD, *Lincoln* (1995); ALLEN C. GUELZO, *Abraham Lincoln: Redeemer President* (1999); and WILLIAM LEE MILLER, *Lincoln's Virtues: An Ethical Biography* (2002). PAUL HORGAN, *Citizen of New Salem* (also published as *Abraham Lincoln, Citizen of New Salem,* 1961), concentrates on Lincoln's early life; while MARK E. NEELY, JR., *The Last Best Hope of Earth: Abraham Lincoln and the Promise of America* (1993), traces Lincoln's later political life through his own speeches. A collection of valuable appreciations is found in RALPH G. NEWMAN (ed.), *Lincoln for the Ages* (1960).

Matters of controversy may be found in LLOYD LEWIS, *Myths after Lincoln* (1929, reissued as *The Assassination of Lincoln: History and Myth,* 1994); RICHARD N. CURRENT, *The Lincoln Nobody Knows* (1958, reprinted 1980); DAVID HERBERT DONALD, *Lincoln's Herndon* (1948, reprinted 1988) and *Lincoln Reconsidered,* 2nd ed., enlarged (1961, reissued 1989); DON E. FEHRENBACHER, *Lincoln in Text and Context* (1987), which compiles essays on prewar politics, the Civil War, and Lincoln's changing image; GABOR S. BORITT and NORMAN O. FORNESS (eds.), *The Historian's Lincoln: Pseudohistory, Psychohistory, and History* (1988); and THOMAS J. DILORENZO, *The Real Lincoln: A New Look at Abraham Lincoln, His Agenda, and an Unnecessary War* (2002). BRUCE TAP, *Over Lincoln's Shoulder: The Committee on the Conduct of the War* (1998), offers a revealing account of the Congressional committee's interference in Lincoln's handling of the war. Lincoln's famous Second Inaugural Address is the subject of RONALD C. WHITE, JR., *Lincoln's Greatest Speech: The Second Inaugural* (2002).

Lincoln's administration is documented in PHILLIP SHAW PALUDAN, *The Presidency of Abraham Lincoln* (1994). Works dealing with aspects of Lincoln's statesmanship are DON E. FEHRENBACHER, *Prelude to Greatness: Lincoln in the 1850s* (1962, reissued 1970); DAVID M. POTTER, *Lincoln and His Party in the Secession Crisis* (1942, reprinted 1979), with emphasis on the period between Lincoln's election and the firing on Fort Sumter; WILLIAM B. HESSELTINE, *Lincoln and the War Governors* (1948, reissued 1972); KENNETH M. STAMPP, *And the War Came: The North and the Secession Crisis, 1860–1861* (1950, reprinted 1980); T. HARRY WILLIAMS, *Lincoln and the Radicals* (1941, reissued 1969), and *Lincoln and His Generals* (1952, reprinted 1981); HANS L. TREFOUSSE, *The Radical Republicans: Lincoln's Vanguard for Racial Justice* (1968); DAVID A. NICHOLS, *Lincoln and the Indians: Civil War Policy and Politics* (1978); GABOR S. BORITT, *Lincoln and the Economics of the American Dream* (1978); JAMES M. MCPHERSON, *Abraham Lincoln and the Second American Revolution* (1990); ROBERT W. JOHANNSEN, *Lincoln, the South, and Slavery: The Political Dimension* (1991); and MICHAEL BURLINGAME (ed.), *Lincoln Observed: Civil War Dispatches of Noah Brooks* (1998), which provides a journalist's recollections of Lincoln.

Books dealing with specific Lincoln issues are numerous. RUTH PAINTER RANDALL, *Mary Lincoln: Biography of a Marriage* (1953, reissued 1961), and *Lincoln's Sons* (1955), examine Lincoln's family life. Randall effectively refutes the views of WILLIAM H. HERNDON and JESSE W. WEIK, *Herndon's Life of Lincoln,* ed. by PAUL M. ANGLE (1930, reissued 1983). Two books about the president's wife are JEAN H. BAKER, *Mary Todd Lincoln: A Biography* (1987); and MARK E. NEELY, JR., and R. GERALD MCMURTRY, *The Insanity File: The Case of Mary Todd Lincoln* (1986, reissued 1993). An able and realistic treatment of Lincoln's legal career is JOHN J. DUFF, *A. Lincoln, Prairie Lawyer* (1960). PHILIP B. KUNHARDT, JR., *A New Birth of Freedom: Lincoln at Gettysburg* (1983), focuses on aspects of his famous speech; as does GARRY WILLS, *Lincoln at Gettysburg: The Words That Remade America* (1992). HAROLD HOLZER (compiler and ed.), *Dear Mr. Lincoln: Letters to the President* (1993), assembles letters written by ordinary citizens covering all topics. HAROLD HOLZER, GABOR S. BORITT, and MARK E. NEELY, JR., *The Lincoln Image: Abraham Lincoln and the Popular Print* (1984), explores Lincoln's rise to fame through the medium of prints; and MARK S. REINHART, *Abraham Lincoln on Screen* (1999), offers a history of films and television programs that feature portrayals of Lincoln. MERRILL D. PETERSON, *Lincoln in American Memory* (1994), examines the view each succeeding generation has had toward Lincoln.

Comparisons between Lincoln and other historical figures include DAVID ZAREFSKY, *Lincoln, Douglas, and Slavery* (1990), which delves into the background of the Lincoln-Douglas debates and outlines each speaker's rhetorical methods; and WILLIAM CATTON and BRUCE CATTON, *Two Roads to Sumter* (1963, reissued 1971), which analyzes the dual roads taken by Lincoln and Jefferson Davis that led to the Civil War.

An overall view of Lincoln's assassination may be found in WILLIAM HANCHETT, *The Lincoln Murder Conspiracies* (1983). More detailed accounts of the last hours of his life include JIM BISHOP, *The Day Lincoln Was Shot* (1955, reprinted 1984); and W. EMERSON RECK, *A. Lincoln, His Last 24 Hours* (1987). A fictional account based on historical research is found in THOMAS MALLON, *Henry and Clara* (1994). (R.N.C./Ed.)

Linguistics

Linguistics is the scientific study of language. The word was first used in the middle of the 19th century to emphasize the difference between a newer approach to the study of language that was then developing and the more traditional approach of philology. The differences were and are largely matters of attitude, emphasis, and purpose. The philologist is concerned primarily with the historical development of languages as it is manifest in written texts and in the context of the associated literature and culture. The linguist, though he may be interested in written texts and in the development of languages through time, tends to give priority to spoken languages and to the problems of analyzing them as they operate at a given point in time.

The field of linguistics may be divided in terms of three dichotomies: synchronic versus diachronic, theoretical versus applied, microlinguistics versus macrolinguistics. A synchronic description of a language describes the language as it is at a given time; a diachronic description is concerned with the historical development of the language and the structural changes that have taken place in it. The goal of theoretical linguistics is the construction of a general theory of the structure of language or of a general theoretical framework for the description of languages; the aim of applied linguistics is the application of the findings and techniques of the scientific study of language to practical tasks, especially to the elaboration of improved methods of language teaching. The terms microlinguistics and macrolinguistics are not yet well established, and they are, in fact, used here purely for convenience. The former refers to a narrower and the latter to a much broader view of the scope of linguistics. According to the microlinguistic view, languages should be analyzed for their own sake and without reference to their social function, to the manner in which they are acquired by children, to the psychological mechanisms that underlie the production and reception of speech, to the literary and the aesthetic or communicative function of language, and so on. In contrast, macrolinguistics embraces all of these aspects of language. Various areas within macrolinguistics have been given terminological recognition: psycholinguistics, sociolinguistics, anthropological linguistics, dialectology, mathematical and computational linguistics, and stylistics.

A large portion of this article is devoted to theoretical, synchronic microlinguistics, which is generally acknowledged as the central part of the subject; it will be abbreviated henceforth as theoretical linguistics. (J.Lyo.)

The article is divided into the following sections:

History of linguistics

EARLIER HISTORY

Non-Western traditions. Linguistic speculation and investigation, insofar as is known, has gone on in only a small number of societies. To the extent that Mesopotamian, Chinese, and Arabic learning dealt with grammar, their treatments were so enmeshed in the particularities of those languages and so little known to the European world until recently that they have had virtually no impact on Western linguistic tradition. Chinese linguistic and philological scholarship stretches back for more than two millennia, but the interest of those scholars was concentrated largely on phonetics, writing, and lexicography; their consideration of grammatical problems was bound up closely with the study of logic.

Certainly the most interesting non-Western grammatical tradition—and the most original and independent—is that of India, which dates back at least two and one-half millennia and which culminates with the grammar of Pāṇini, of the 5th century BC. There are three major ways in which the Sanskrit tradition has had an impact on modern linguistic scholarship. As soon as Sanskrit became known to the Western learned world the unravelling of comparative Indo-European grammar ensued and the foundations were laid for the whole 19th-century edifice of comparative philology and historical linguistics. But, for this, Sanskrit was simply a part of the data; Indian grammatical learning played almost no direct part. Nineteenth-century workers, however, recognized that the native tradition of phonetics in ancient India was vastly superior to Western knowledge; and this had important consequences for the growth of the science of phonetics in the West. Thirdly, there is in the rules or definitions (sutras) of Pāṇini a remarkably subtle and penetrating account of Sanskrit grammar. The construction of sentences, compound nouns, and the like is explained through ordered rules operating on underlying structures in a manner strikingly similar in part to modes of contemporary theory. As might be imagined, this perceptive Indian grammatical work has held great fascination for 20th-century theoretical linguists. A study of Indian logic in relation to Pāṇinian grammar alongside Aristotelian and Western logic in relation to Greek grammar and its successors could bring illuminating insights.

Sanskrit grammar

Whereas in ancient Chinese learning a separate field of study that might be called grammar scarcely took root, in ancient India a sophisticated version of this discipline developed early alongside the other sciences. Even though the study of Sanskrit grammar may originally have had the practical aim of keeping the sacred Vedic texts and their commentaries pure and intact, the study of grammar in India in the 1st millennium BC had already become an intellectual end in itself.

Greek and Roman antiquity. The emergence of grammatical learning in Greece is less clearly known than is sometimes implied, and the subject is more complex than is often supposed; here only the main strands can be sampled. The term *hē grammatikē technē* ("the art of letters") had two senses. It meant the study of the values of the letters and of accentuation and prosody and, in this sense, was an abstract intellectual discipline; and it also meant the skill of literacy and thus embraced applied pedagogy. This side of what was to become "grammatical" learning was distinctly applied, particular, and less exalted by comparison with other pursuits. Most of the developments associated with theoretical grammar grew out of philosophy and criticism; and in these developments a repeated duality of themes crosses and intertwines.

Much of Greek philosophy was occupied with the distinction between that which exists "by nature" and that which exists "by convention." So in language it was natural to account for words and forms as ordained by nature (by onomatopoeia—*i.e.,* by imitation of natural sounds) or as arrived at arbitrarily by a social convention. This dispute regarding the origin of language and meanings paved the way for the development of divergences between the views of the "analogists," who looked on language as possessing an essential regularity as a result of the symmetries that convention can provide, and the views of the "anomalists," who pointed to language's lack of regularity as one facet of the inescapable irregularities of nature. The situation was more complex, however, than this statement would suggest. For example, it seems that the anomalists among the Stoics credited the irrational quality of language precisely to the claim that language did not exactly mirror nature. In any event, the anomalist tradition in the hands of the Stoics brought grammar the benefit of their work in logic and rhetoric. This led to the distinction that, in modern theory, is made with the terms *signifiant* ("what signifies") and *signifié* ("what is signified") or, somewhat differently and more elaborately, with "expression" and "content"; and it laid the groundwork of modern theories of inflection, though by no means with the exhaustiveness and fine-grained analysis reached by the Sanskrit grammarians.

"Analogists" and "anomalists"

The Alexandrians, who were analogists working largely on literary criticism and text philology, completed the development of the classical Greek grammatical tradition. Dionysius Thrax, in the 2nd century BC, produced the first systematic grammar of Western tradition; it dealt only with word morphology. The study of sentence syntax was to wait for Apollonius Dyscolus, of the 2nd century AD. Dionysius called grammar "the acquaintance with [or observation of] what is uttered by poets and writers," using a word meaning a less general form of knowledge than what might be called "science." His typically Alexandrian literary goal is suggested by the headings in his work: pronunciation, poetic figurative language, difficult words, true and inner meanings of words, exposition of form-classes, literary criticism. Dionysius defined a sentence as a unit of sense or thought, but it is difficult to be sure of his precise meaning.

The Romans, who largely took over, with mild adaptations to their highly similar language, the total work of the Greeks, are important not as originators but as transmitters. Aelius Donatus, of the 4th century AD, and Priscian, an African of the 6th century, and their colleagues were slightly more systematic than their Greek models but were essentially retrospective rather than original. Up to this point a field that was at times called *ars grammatica* was a congeries of investigations, both theoretical and practical, drawn from the work and interests of literacy, scribeship, logic, epistemology, rhetoric, textual philosophy, poetics, and literary criticism. Yet modern specialists in the field still share their concerns and interests. The anomalists, who concentrated on surface irregularity and who looked then for regularities deeper down (as the Stoics sought them in logic) bear a resemblance to contemporary scholars of the transformationalist school. And the philological analogists with their regularizing surface segmentation show striking kinship of spirit with the modern school of structural (or taxonomic or glossematic) grammatical theorists.

The European Middle Ages. It is possible that developments in grammar during the Middle Ages constitute one of the most misunderstood areas of the field of linguistics. It is difficult to relate this period coherently to other periods and to modern concerns because surprisingly little is accessible and certain, let alone analyzed with sophistication. In the early 1970s the majority of the known grammatical treatises had not yet been made available in full to modern scholarship, so that not even their true extent could be classified with confidence. These works must be analyzed and studied in the light of medieval learning, especially the learning of the schools of philosophy then current, in order to understand their true value and place.

The field of linguistics has almost completely neglected the achievements of this period. Students of grammar have tended to see as high points in their field the achievements of the Greeks, the Renaissance growth and "rediscovery" of learning (which led directly to modern school traditions), the contemporary flowering of theoretical study (men usually find their own age important and fascinating), and, in recent decades, the astonishing monument of Pāṇini. Many linguists have found uncongenial the combination of medieval Latin learning and premodern philosophy. Yet medieval scholars might reasonably be expected to have bequeathed to modern scholarship the fruits of more than ordinarily refined perceptions of a certain order. These scholars used, wrote in, and studied

Use of Latin by medieval scholars

Latin, a language that, though not their native tongue, was one in which they were very much at home; such scholars in groups must often have represented a highly varied linguistic background.

Some of the medieval treatises continue the tradition of grammars of late antiquity; so there are versions based on Donatus and Priscian, often with less incorporation of the classical poets and writers. Another genre of writing involves simultaneous consideration of grammatical distinctions and scholastic logic; modern linguists are probably inadequately trained to deal with these writings.

Certainly the most obviously interesting theorizing to be found in this period is contained in the "speculative grammar" of the *modistae,* who were so called because the titles of their works were often phrased *De modis significandi tractatus* ("Treatise Concerning the Modes of Signifying"). For the development of the Western grammatical tradition, work of this genre was the second great milestone after the crystallization of Greek thought with the Stoics and Alexandrians. The scholastic philosophers were occupied with relating words and things—*i.e.,* the structure of sentences with the nature of the real world—hence their preoccupation with signification. The aim of the grammarians was to explore how a word (an element of language) matched things apprehended by the mind and how it signified reality. Since a word cannot signify the nature of reality directly, it must stand for the thing signified in one of its modes or properties; it is this discrimination of modes that the study of categories and parts of speech is all about. Thus the study of sentences should lead one to the nature of reality by way of the modes of signifying.

The *modistae*

The *modistae* did not innovate in discriminating categories and parts of speech; they accepted those that had come down from the Greeks through Donatus and Priscian. The great contribution of these grammarians, who flourished between the mid-13th and mid-14th century, was their insistence on a grammar to explicate the distinctions found by their forerunners in the languages known to them. Whether they made the best choice in selecting logic, metaphysics, and epistemology (as they knew them) as the fields to be included with grammar as a basis for the grand account of universal knowledge is less important than the breadth of their conception of the place of grammar. Before the *modistae,* grammar had not been viewed as a separate discipline but had been considered in conjunction with other studies or skills (such as criticism, preservation of valued texts, foreign-language learning). The Greek view of grammar was rather narrow and fragmented; the Roman view was largely technical. The speculative medieval grammarians (who dealt with language as a *speculum,* "mirror" of reality) inquired into the fundamentals underlying language and grammar. They wondered whether grammarians or philosophers discovered grammar, whether grammar was the same for all languages, what the fundamental topic of grammar was, and what the basic and irreducible grammatical primes are. Signification was reached by imposition of words on things; *i.e.,* the sign was arbitrary. Those questions sound remarkably like current issues of linguistics, which serves to illustrate how slow and repetitious progress in the field is. While the *modistae* accepted, by modern standards, a restrictive set of categories, the acumen and sweep they brought to their task resulted in numerous subtle and fresh syntactic observations. A thorough study of the medieval period would greatly enrich the discussion of current questions.

The Renaissance. It is customary to think of the Renaissance as a time of great flowering. There is no doubt that linguistic and philological developments of this period are interesting and significant. Two new sets of data that modern linguists tend to take for granted became available to grammarians during this period: (1) the newly recognized vernacular languages of Europe, for the protection and cultivation of which there subsequently arose national academies and learned institutions that live down to the present day; and (2) the exotic languages of Africa, the Orient, the New World, and, later, of Siberia, Inner Asia, Papua, Oceania, the Arctic, and Australia, which the voyages of discovery opened up. Earlier, the only non-Indo-European grammar at all widely accessible was that of the Hebrews (and to some extent Arabic); and Semitic in fact shares many categories with Indo-European in its grammar. Indeed, for many of the exotic languages scholarship barely passed beyond the most rudimentary initial collection of word lists; grammatical analysis was scarcely approached.

New sources of data

In the field of grammar, the Renaissance did not produce notable innovation or advance. Generally speaking, there was a strong rejection of speculative grammar and a relatively uncritical resumption of late Roman views (as stated by Priscian). This was somewhat understandable in the case of Latin or Greek grammars, since here the task was less evidently that of intellectual inquiry and more that of the schools, with the practical aim of gaining access to the newly discovered ancients. But, aside from the fact that, beginning in the 15th century, serious grammars of European vernaculars were actually written, it is only in particular cases and for specific details (*e.g.,* a mild alteration in the number of parts of speech or cases of nouns) that real departures from Roman grammar can be noted. Likewise, until the end of the 19th century, grammars of the exotic languages, written largely by missionaries and traders, were cast almost entirely in the Roman model, to which the Renaissance had added a limited medieval syntactic ingredient.

From time to time a degree of boldness may be seen in France: Petrus Ramus, a 16th-century logician, worked within a taxonomic framework of the surface shapes of words and inflections, such work entailing some of the attendant trivialities that modern linguistics has experienced (*e.g.,* by dividing up Latin nouns on the basis of equivalence of syllable count among their case forms).

The Port-Royal school

In the 17th century, members of Solitaires (a group of hermits who lived in the deserted abbey of Port-Royal in France) produced a grammar that has exerted noteworthy continuing influence, even in contemporary theoretical discussion. Drawing their basic view from scholastic logic as modified by rationalism, these people aimed to produce a philosophical grammar that would capture what was common to the grammars of languages—a general grammar, but not aprioristically universalist. This grammar has attracted recent attention because it employs certain syntactic formulations that resemble in detail contemporary transformational rules, which formulate the relationship between the various elements of a sentence.

Roughly from the 15th century to World War II, however, the version of grammar available to the Western public (together with its colonial expansion) remained basically that of Priscian with only occasional and subsidiary modifications, and the knowledge of new languages brought only minor adjustments to the serious study of grammar. As education has become more broadly disseminated throughout society by the schools, attention has shifted from theoretical or technical grammar as an intellectual preoccupation to prescriptive grammar suited to pedagogical purposes, which started with Renaissance vernacular nationalism. Grammar increasingly parted company with its older fellow disciplines within philosophy as they moved over to the domain known as natural science, and technical academic grammatical study has increasingly become involved with issues represented by empiricism versus rationalism and their successor manifestations on the academic scene.

Nearly down to the present day, the grammar of the schools has had only tangential connections with the studies pursued by professional linguists; for most people prescriptive grammar has become synonymous with "grammar," and the prevailing view held by educated people regards grammar as an item of folk knowledge open to speculation by all, and in nowise a formal science requiring adequate preparation such as is assumed for chemistry. (E.P.H./Ed.)

THE 19TH CENTURY

Development of the comparative method. It is generally agreed that the most outstanding achievement of linguistic scholarship in the 19th century was the development of

the comparative method, which comprised a set of principles whereby languages could be systematically compared with respect to their sound systems, grammatical structure, and vocabulary and shown to be "genealogically" related. As French, Italian, Portuguese, Romanian, Spanish, and the other Romance languages had evolved from Latin, so Latin, Greek, and Sanskrit as well as the Celtic, Germanic, and Slavic languages and many other languages of Europe and Asia had evolved from some earlier language, to which the name Indo-European or Proto-Indo-European is now customarily applied. That all the Romance languages were descended from Latin and thus constituted one "family" had been known for centuries; but the existence of the Indo-European family of languages and the nature of their genealogical relationship was first demonstrated by the 19th-century comparative philologists. (The term philology in this context is not restricted to the study of literary languages.)

Discovery of the Indo-European language family

The main impetus for the development of comparative philology came toward the end of the 18th century, when it was discovered that Sanskrit bore a number of striking resemblances to Greek and Latin. An English orientalist, Sir William Jones, though he was not the first to observe these resemblances, is generally given the credit for bringing them to the attention of the scholarly world and putting forward the hypothesis, in 1786, that all three languages must have "sprung from some common source, which perhaps no longer exists." By this time, a number of texts and glossaries of the older Germanic languages (Gothic, Old High German, and Old Norse) had been published, and Jones realized that Germanic as well as Old Persian and perhaps Celtic had evolved from the same "common source." The next important step came in 1822, when the German scholar Jacob Grimm, following the Danish linguist Rasmus Rask (whose work, being written in Danish, was less accessible to most European scholars), pointed out in the second edition of his comparative grammar of Germanic that there were a number of systematic correspondences between the sounds of Germanic and the sounds of Greek, Latin, and Sanskrit in related words. Grimm noted, for example, that where Gothic (the oldest surviving Germanic language) had an *f,* Latin, Greek, and Sanskrit frequently had a *p* (*e.g.,* Gothic *fotus,* Latin *pedis,* Greek *podós,* Sanskrit *padás,* all meaning "foot"); when Gothic had a *p,* the non-Germanic languages had a *b;* when Gothic had a *b,* the non-Germanic languages had what Grimm called an "aspirate" (Latin *f,* Greek *ph,* Sanskrit *bh*). In order to account for these correspondences he postulated a cyclical "soundshift" (*Lautverschiebung*) in the prehistory of Germanic, in which the original "aspirates" became voiced unaspirated stops (*bh* became *b,* etc.), the original voiced unaspirated stops became voiceless (*b* became *p,* etc.), and the original voiceless (unaspirated) stops became "aspirates" (*p* became *f*). Grimm's term, "aspirate," it will be noted, covered such phonetically distinct categories as aspirated stops (*bh, ph*), produced with an accompanying audible puff of breath, and fricatives (*f*), produced with audible friction as a result of incomplete closure in the vocal tract.

The Neogrammarians and sound laws

In the work of the next 50 years the idea of sound change was made more precise, and, in the 1870s, a group of scholars known collectively as the *Junggrammatiker* ("young grammarians," or Neogrammarians) put forward the thesis that all changes in the sound system of a language as it developed through time were subject to the operation of regular sound laws. Though the thesis that sound laws were absolutely regular in their operation (unless they were inhibited in particular instances by the influence of analogy) was at first regarded as most controversial, by the end of the 19th century it was quite generally accepted and had become the cornerstone of the comparative method. Using the principle of regular sound change, scholars were able to reconstruct "ancestral" common forms from which the later forms found in particular languages could be derived. By convention, such reconstructed forms are marked in the literature with an asterisk. Thus, from the reconstructed Proto-Indo-European word for "ten," **dekm,* it was possible to derive Sanskrit *daśa,* Greek *déka,* Latin *decem,* and Gothic *taihun* by postulating a number of different sound laws that operated independently in the different branches of the Indo-European family. The question of sound change is dealt with in greater detail in the section entitled *Historical linguistics.*

The role of analogy. Analogy has been mentioned in connection with its inhibition of the regular operation of sound laws in particular word forms. This was how the Neogrammarians thought of it. In the course of the 20th century, however, it has come to be recognized that analogy, taken in its most general sense, plays a far more important role in the development of languages than simply that of sporadically preventing what would otherwise be a completely regular transformation of the sound system of a language. When a child learns to speak he tends to regularize the anomalous, or irregular, forms by analogy with the more regular and productive patterns of formation in the language; *e.g.,* he will tend to say "comed" rather than "came," "dived" rather than "dove," and so on, just as he will say "talked," "loved," and so forth. The fact that the child does this is evidence that he has learned or is learning the regularities or rules of his language. He will go on to "unlearn" some of the analogical forms and substitute for them the anomalous forms current in the speech of the previous generation. But in some cases, he will keep a "new" analogical form (*e.g.,* "dived" rather than "dove"), and this may then become the recognized and accepted form.

Other 19th-century theories and development. *Inner and outer form.* One of the most original, if not one of the most immediately influential, linguists of the 19th century was the learned Prussian statesman, Wilhelm von Humboldt (died 1835). His interests, unlike those of most of his contemporaries, were not exclusively historical. Following the German philosopher Johann Gottfried von Herder (1744–1803), he stressed the connection between national languages and national character: this was but a commonplace of romanticism. More original was Humboldt's theory of "inner" and "outer" form in language. The outer form of language was the raw material (the sounds) from which different languages were fashioned; the inner form was the pattern, or structure, of grammar and meaning that was imposed upon this raw material and differentiated one language from another. This "structural" conception of language was to become dominant, for a time at least, in many of the major centres of linguistics by the middle of the 20th century. Another of Humboldt's ideas was that language was something dynamic, rather than static, and was an activity itself rather than the product of activity. A language was not a set of actual utterances produced by speakers but the underlying principles or rules that made it possible for speakers to produce such utterances and, moreover, an unlimited number of them. This idea was taken up by a German philologist, Heymann Steinthal, and, what is more important, by the physiologist and psychologist Wilhelm Wundt, and thus influenced late 19th- and early 20th-century theories of the psychology of language. Its influence, like that of the distinction of inner and outer form, can also be seen in the thought of Ferdinand de Saussure, a Swiss linguist. But its full implications were probably not perceived and made precise until the middle of the 20th century, when the U.S. linguist Noam Chomsky re-emphasized it and made it one of the basic notions of generative grammar (see below).

Ideas of Wilhelm von Humboldt

Phonetics and dialectology. Many other interesting and important developments occurred in 19th-century linguistic research, among them work in the areas of phonetics and dialectology. Research in both these fields was promoted by the Neogrammarians' concern with sound change and by their insistence that prehistoric developments in languages were of the same kind as developments taking place in the languages and dialects currently spoken. The development of phonetics in the West was also strongly influenced at this period, as were many of the details of the more philological analysis of the Indo-European languages, by the discovery of the works of the Indian grammarians who, from the time of the Sanskrit grammarian Pāṇini (5th or 6th century BC), if not before, had arrived at a much more comprehensive and scientific

Development of phonetics

theory of phonetics, phonology, and morphology than anything achieved in the West until the modern period.

THE 20TH CENTURY

Structuralism. The term structuralism has been used as a slogan and rallying cry by a number of different schools of linguistics, and it is necessary to realize that it has somewhat different implications according to the context in which it is employed. It is convenient to draw first a broad distinction between European and American structuralism and, then, to treat them separately.

Structural linguistics in Europe. Structural linguistics in Europe is generally said to have begun in 1916 with the posthumous publication of the *Cours de Linguistique Générale (Course in General Linguistics)* of Ferdinand de Saussure. Much of what is now considered as Saussurean can be seen, though less clearly, in the earlier work of Humboldt, and the general structural principles that Saussure was to develop with respect to synchronic linguistics in the *Cours* had been applied almost 40 years before (1879) by Saussure himself in a reconstruction of the Indo-European vowel system. The full significance of the work was not appreciated at the time. Saussure's structuralism can be summed up in two dichotomies (which jointly cover what Humboldt referred to in terms of his own distinction of inner and outer form): (1) *langue* versus *parole* and (2) form versus substance. By *langue,* best translated in its technical Saussurean sense as language system, is meant the totality of regularities and patterns of formation that underlie the utterances of a language; by *parole,* which can be translated as language behaviour, is meant the actual utterances themselves. Just as two performances of a piece of music given by different orchestras on different occasions will differ in a variety of details and yet be identifiable as performances of the same piece, so two utterances may differ in various ways and yet be recognized as instances, in some sense, of the same utterance. What the two musical performances and the two utterances have in common is an identity of form, and this form, or structure, or pattern, is in principle independent of the substance, or "raw material," upon which it is imposed.

European sense of structuralism

"Structuralism," in the European sense then, refers to the view that there is an abstract relational structure that underlies and is to be distinguished from actual utterances—a system underlying actual behaviour—and that this is the primary object of study for the linguist.

Two important points arise here: first, that the structural approach is not in principle restricted to synchronic linguistics; second, that the study of meaning, as well as the study of phonology and grammar, can be structural in orientation. In both cases "structuralism" is opposed to "atomism" in the European literature. It was Saussure who drew the terminological distinction between synchronic and diachronic linguistics in the *Cours;* despite the undoubtedly structural orientation of his own early work in the historical and comparative field, he maintained that, whereas synchronic linguistics should deal with the structure of a language system at a given point in time, diachronic linguistics should be concerned with the historical development of isolated elements—it should be atomistic. Whatever the reasons that led Saussure to take this rather paradoxical view, his teaching on this point was not generally accepted, and scholars soon began to apply structural concepts to the diachronic study of languages. The most important of the various schools of structural linguistics to be found in Europe in the first half of the 20th century have included the Prague school, most notably represented by Nikolay Sergeyevich Trubetskoy (died 1938) and Roman Jakobson (born 1896), both Russian émigrés, and the Copenhagen (or glossematic) school, centred around Louis Hjelmslev (died 1965). John Rupert Firth (died 1960) and his followers, sometimes referred to as the London school, were less Saussurean in their approach, but, in a general sense of the term, their approach may also be described appropriately as structural linguistics.

Structural linguistics in America. American and European structuralism shared a number of features. In insisting upon the necessity of treating each language as a more or less coherent and integrated system, both European and American linguists of this period tended to emphasize, if not to exaggerate, the structural uniqueness of individual languages. There was especially good reason to take this point of view given the conditions in which American linguistics developed from the end of the 19th century. There were hundreds of indigenous American Indian languages that had never been previously described. Many of these were spoken by only a handful of speakers and, if they were not recorded before they became extinct, would be permanently inaccessible. Under these circumstances, such linguists as Franz Boas (died 1942) were less concerned with the construction of a general theory of the structure of human language than they were with prescribing sound methodological principles for the analysis of unfamiliar languages. They were also fearful that the description of these languages would be distorted by analyzing them in terms of categories derived from the analysis of the more familiar Indo-European languages.

The work of Sapir, Bloomfield, and Whorf

After Boas, the two most influential American linguists were Edward Sapir (died 1939) and Leonard Bloomfield (died 1949). Like his teacher Boas, Sapir was equally at home in anthropology and linguistics, the alliance of which disciplines has endured to the present day in many American universities. Boas and Sapir were both attracted by the Humboldtian view of the relationship between language and thought, but it was left to one of Sapir's pupils, Benjamin Lee Whorf, to present it in a sufficiently challenging form to attract widespread scholarly attention. Since the republication of Whorf's more important papers in 1956, the thesis that language determines perception and thought has come to be known as the Whorfian hypothesis.

Sapir's work has always held an attraction for the more anthropologically inclined American linguists. But it was Bloomfield who prepared the way for the later phase of what is now thought of as the most distinctive manifestation of American "structuralism." When he published his first book in 1914, Bloomfield was strongly influenced by Wundt's psychology of language. In 1933, however, he published a drastically revised and expanded version with the new title *Language;* this book dominated the field for the next 30 years. In it Bloomfield explicitly adopted a behaviouristic approach to the study of language, eschewing in the name of scientific objectivity all reference to mental or conceptual categories. Of particular consequence was his adoption of the behaviouristic theory of semantics according to which meaning is simply the relationship between a stimulus and a verbal response. Because science was still a long way from being able to give a comprehensive account of most stimuli, no significant or interesting results could be expected from the study of meaning for some considerable time, and it was preferable, as far as possible, to avoid basing the grammatical analysis of a language on semantic considerations. Bloomfield's followers pushed even further the attempt to develop methods of linguistic analysis that were not based on meaning. One of the most characteristic features of "post-Bloomfieldian" American structuralism, then, was its almost complete neglect of semantics.

Another characteristic feature, one that was to be much criticized by Chomsky, was its attempt to formulate a set of "discovery procedures"—procedures that could be applied more or less mechanically to texts and could be guaranteed to yield an appropriate phonological and grammatical description of the language of the texts. Structuralism, in this narrower sense of the term, is represented, with differences of emphasis or detail, in the major American textbooks published during the 1950s.

Transformational grammar. The most significant development in linguistic theory and research in recent years was the rise of generative grammar, and, more especially, of transformational-generative grammar, or transformational grammar, as it came to be known. Two versions of transformational grammar were put forward in the mid-1950s, the first by Zellig S. Harris and the second by Noam Chomsky, his pupil. It is Chomsky's system that has attracted the most attention so far. As first presented by Chomsky in *Syntactic Structures* (1957), transformational grammar can be seen partly as a reaction against

The work of Harris and Chomsky

post-Bloomfieldian structuralism and partly as a continuation of it. What Chomsky reacted against most strongly was the post-Bloomfieldian concern with discovery procedures. In his opinion, linguistics should set itself the more modest and more realistic goal of formulating criteria for evaluating alternative descriptions of a language without regard to the question of how these descriptions had been arrived at. The statements made by linguists in describing a language should, however, be cast within the framework of a far more precise theory of grammar than had hitherto been the case, and this theory should be formalized in terms of modern mathematical notions. Within a few years, Chomsky had broken with the post-Bloomfieldians on a number of other points also. He had adopted what he called a "mentalistic" theory of language, by which term he implied that the linguist should be concerned with the speaker's creative linguistic competence and not his performance, the actual utterances produced. He had challenged the post-Bloomfieldian concept of the phoneme (see below), which many scholars regarded as the most solid and enduring result of the previous generation's work. And he had challenged the structuralists' insistence upon the uniqueness of every language, claiming instead that all languages were, to a considerable degree, cut to the same pattern—they shared a certain number of formal and substantive universals.

Tagmemic, stratificational, and other approaches. The effect of Chomsky's ideas has been phenomenal. It is hardly an exaggeration to say that there is no major theoretical issue in linguistics today that is debated in terms other than those in which he has chosen to define it, and every school of linguistics tends to define its position in relation to his. Among the rival schools are tagmemics, stratificational grammar, and the Prague school. Tagmemics is the system of linguistic analysis developed by the U.S. linguist Kenneth L. Pike and his associates in connection with their work as Bible translators. Its foundations were laid during the 1950s, when Pike differed from the post-Bloomfieldian structuralists on a number of principles, and it has been further elaborated since then. Tagmemic analysis has been used for analyzing a great many previously unrecorded languages, especially in Central and South America and in West Africa. Stratificational grammar, developed by a U.S. linguist, Sydney M. Lamb, has been seen by some linguists as an alternative to transformational grammar. Not yet fully expounded or widely exemplified in the analysis of different languages, stratificational grammar is perhaps best characterized as a radical modification of post-Bloomfieldian linguistics, but it has many features that link it with European structuralism. The Prague school has been mentioned above for its importance in the period immediately following the publication of Saussure's *Cours*. Many of its characteristic ideas (in particular, the notion of distinctive features in phonology) have been taken up by other schools. But there has been further development in Prague of the functional approach to syntax (see below). The work of M.A.K. Halliday in England derived much of its original inspiration from Firth (above), but Halliday provided a more systematic and comprehensive theory of the structure of language than Firth had, and it has been quite extensively illustrated.

Prague school

Methods of synchronic linguistic analysis

STRUCTURAL LINGUISTICS

This section is concerned mainly with a version of structuralism (which may also be called descriptive linguistics) developed by scholars working in a post-Bloomfieldian tradition.

Phonology. With the great progress made in phonetics in the late 19th century, it had become clear that the question whether two speech sounds were the same or not was more complex than might appear at first sight. Two utterances of what was taken to be the same word might differ quite perceptibly from one occasion of utterance to the next. Some of this variation could be attributed to a difference of dialect or accent and is of no concern here. But even two utterances of the same word by the same speaker might vary from one occasion to the next. Variation of this kind, though it is generally less obvious and would normally pass unnoticed, is often clear enough to the trained phonetician and is measurable instrumentally. It is known that the "same" word is being uttered, even if the physical signal produced is variable, in part, because the different pronunciations of the same word will cluster around some acoustically identifiable norm. But this is not the whole answer, because it is actually impossible to determine norms of pronunciation in purely acoustic terms. Once it has been decided what counts as "sameness" of sound from the linguistic point of view, the permissible range of variation for particular sounds in particular contexts can be measured, and, within certain limits, the acoustic cues for the identification of utterances as "the same" can be determined.

What is at issue is the difference between phonetic and phonological (or phonemic) identity, and for these purposes it will be sufficient to define phonetic identity in terms solely of acoustic "sameness." Absolute phonetic identity is a theoretical ideal never fully realized. From a purely phonetic point of view, sounds are more or less similar, rather than absolutely the same or absolutely different. Speech sounds considered as units of phonetic analysis in this article are called phones, and, following the normal convention, are represented by enclosing the appropriate alphabetic symbol in square brackets. Thus [p] will refer to a *p* sound (*i.e.*, what is described more technically as a voiceless, bilabial stop); and [pit] will refer to a complex of three phones—a *p* sound, followed by an *i* sound, followed by a *t* sound. A phonetic transcription may be relatively broad (omitting much of the acoustic detail) or relatively narrow (putting in rather more of the detail), according to the purpose for which it is intended. A very broad transcription will be used in this article except when finer phonetic differences must be shown.

Phones: speech sounds

Phonological, or phonemic, identity was referred to above as "sameness of sound from the linguistic point of view." Considered as phonological units—*i.e.*, from the point of view of their function in the language—sounds are described as phonemes and are distinguished from phones by enclosing their appropriate symbol (normally, but not necessarily, an alphabetic one) between two slash marks. Thus /p/ refers to a phoneme that may be realized on different occasions of utterance or in different contexts by a variety of more or less different phones. Phonological identity, unlike phonetic similarity, is absolute: two phonemes are either the same or different, they cannot be more or less similar. For example, the English words "bit" and "pit" differ phonemically in that the first has the phoneme /b/ and the second has the phoneme /p/ in initial position. As the words are normally pronounced, the phonetic realization of /b/ will differ from the phonetic realization of /p/ in a number of different ways: it will be at least partially voiced (*i.e.*, there will be some vibration of the vocal cords), it will be without aspiration (*i.e.*, there will be no accompanying slight puff of air, as there will be in the case of the phone realizing /p/), and it will be pronounced with less muscular tension. It is possible to vary any one or all of these contributory differences, making the phones in question more or less similar, and it is possible to reduce the phonetic differences to the point that the hearer cannot be certain which word, "bit" or "pit," has been uttered. But it must be either one or the other; there is no word with an initial sound formed in the same manner as /p/ or /b/ that is halfway between the two. This is what is meant by saying that phonemes are absolutely distinct from one another—they are discrete rather than continuously variable.

How it is known whether two phones realize the same phoneme or not is dealt with differently by different schools of linguists. The "orthodox" post-Bloomfieldian school regards the first criterion to be phonetic similarity. Two phones are not said to realize the same phoneme unless they are sufficiently similar. What is meant by "sufficiently similar" is rather vague, but it must be granted that for every phoneme there is a permissible range of variation in the phones that realize it. As far as occurrence in the same context goes, there are no serious problems.

Classifying phones or phonemes

More critical is the question of whether two phones occurring in different contexts can be said to realize the same phoneme or not. To take a standard example from English: the phone that occurs at the beginning of the word "pit" differs from the phone that occurs after the initial /s/ of "spit." The "*p* sound" occurring after the /s/ is unaspirated (*i.e.*, it is pronounced without any accompanying slight puff of air). The aspirated and unaspirated "*p* sounds" may be symbolized rather more narrowly as [pʰ] and [p] respectively. The question then is whether [pʰ] and [p] realize the same phoneme /p/ or whether each realizes a different phoneme. They satisfy the criterion of phonetic similarity, but this, though a necessary condition of phonemic identity, is not a sufficient one.

The next question is whether there is any pair of words in which the two phones are in minimal contrast (or opposition); that is, whether there is any context in English in which the occurrence of the one rather than the other has the effect of distinguishing two or more words (in the way that [pʰ] versus [b] distinguishes the so-called minimal pairs "pit" and "bit," "pan" and "ban," and so on). If there is, it can be said that, despite their phonetic similarity, the two phones realize (or "belong to") different phonemes—that the difference between them is phonemic. If there is no context in which the two phones are in contrast (or opposition) in this sense, it can be said that they are variants of the same phoneme—that the difference between them is nonphonemic. Thus, the difference between [pʰ] and [p] in English is nonphonemic; the two sounds realize, or belong to, the same phoneme, namely /p/. In several other languages—*e.g.*, Hindi—the contrast between such sounds as [pʰ] and [p] is phonemic. however. The question is rather more complicated than it has been represented here. In particular, it should be noted that [p] is phonetically similar to [b] as well as to [pʰ] and that, although [pʰ] and [b] are in contrast, [p] and [b] are not. It would thus be possible to regard [p] and [b] as variants of the same phoneme. Most linguists, however, have taken the alternative view, assigning [p] to the same phoneme as [pʰ]. Here it will suffice to note that the criteria of phonetic similarity and lack of contrast do not always uniquely determine the assignment of phones to phonemes. Various supplementary criteria may then be invoked.

Free variation and complementary distribution

Phones that can occur and do not contrast in the same context are said to be in free variation in that context, and, as has been shown, there is a permissible range of variation for the phonetic realization of all phonemes. More important than free variation in the same context, however, is systematically determined variation according to the context in which a given phoneme occurs. To return to the example used above: [p] and [pʰ], though they do not contrast, are not in free variation either. Each of them has its own characteristic positions of occurrence, and neither occurs, in normal English pronunciation, in any context characteristic for the other (*e.g.*, only [pʰ] occurs at the beginning of a word, and only [p] occurs after s). This is expressed by saying that they are in complementary distribution. (The distribution of an element is the whole range of contexts in which it can occur.) Granted that [p] and [pʰ] are variants of the same phoneme /p/, it can be said that they are contextually, or positionally, determined variants of it. To use the technical term, they are allophones of /p/. The allophones of a phoneme, then, are its contextually determined variants and they are in complementary distribution.

The post-Bloomfieldians made the assignment of phones to phonemes subject to what is now generally referred to as the principle of bi-uniqueness. The phonemic specification of a word or utterance was held to determine uniquely its phonetic realization (except for free variation), and, conversely, the phonetic description of a word or utterance was held to determine uniquely its phonemic analysis. Thus, if two words or utterances are pronounced alike, then they must receive the same phonemic description; conversely, two words or utterances that have been given the same phonemic analysis must be pronounced alike. The principle of bi-uniqueness was also held to imply that, if a given phone was assigned to a particular phoneme in one position of occurrence, then it must be assigned to the same phoneme in all its other positions of occurrence; it could not be the allophone of one phoneme in one context and of another phoneme in other contexts.

A second important principle of the post-Bloomfieldian approach was its insistence that phonemic analysis should be carried out prior to and independently of grammatical analysis. Neither this principle nor that of bi-uniqueness was at all widely accepted outside the post-Bloomfieldian school, and they have been abandoned by the generative phonologists (see below).

Phonemes of the kind referred to so far are segmental; they are realized by consonantal or vocalic (vowel) segments of words, and they can be said to occur in a certain order relative to one another. For example, in the phonemic representation of the word "bit," the phoneme /b/ precedes /i/, which precedes /t/. But nonsegmental, or suprasegmental, aspects of the phonemic realization of words and utterances may also be functional in a language. In English, for example, the noun "import" differs from the verb "import" in that the former is accented on the first and the latter on the second syllable. This is called a stress accent: the accented syllable is pronounced with greater force or intensity. Many other languages distinguish words suprasegmentally by tone. For example, in Mandarin Chinese the words *haŏ* "day" and *haŏ* "good" are distinguished from one another in that the first has a falling tone and the second a falling-rising tone; these are realized, respectively, as (1) a fall in the pitch of the syllable from high to low and (2) a change in the pitch of the syllable from medium to low and back to medium. Stress and tone are suprasegmental in the sense that they are "superimposed" upon the sequence of segmental phonemes. The term tone is conventionally restricted by linguists to phonologically relevant variations of pitch at the level of words. Intonation, which is found in all languages, is the variation in the pitch contour or pitch pattern of whole utterances, of the kind that distinguishes (either of itself or in combination with some other difference) statements from questions or indicates the mood or attitude of the speaker (as hesitant, surprised, angry, and so forth). Stress, tone, and intonation do not exhaust the phonologically relevant suprasegmental features found in various languages, but they are among the most important.

Suprasegmental phonemes

A complete phonological description of a language includes all the segmental phonemes and specifies which allophones occur in which contexts. It also indicates which sequences of phonemes are possible in the language and which are not: it will indicate, for example, that the sequences /bl/ and /br/ are possible at the beginning of English words but not /bn/ or /bm/. A phonological description also identifies and states the distribution of the suprasegmental features. Just how this is to be done, however, has been rather more controversial in the post-Bloomfieldian tradition. Differences between the post-Bloomfieldian approach to phonology and approaches characteristic of other schools of structural linguistics will be treated below.

Morphology. The grammatical description of many, if not all, languages is conveniently divided into two complementary sections: morphology and syntax. The relationship between them, as generally stated, is as follows: morphology accounts for the internal structure of words, and syntax describes how words are combined to form phrases, clauses, and sentences.

Distinction between morphology and syntax

There are many words in English that are fairly obviously analyzable into smaller grammatical units. For example, the word "unacceptability" can be divided into *un-*, *accept*, *abil-*, and *-ity* (*abil-* being a variant of *-able*). Of these, at least three are minimal grammatical units, in the sense that they cannot be analyzed into yet smaller grammatical units—*un-*, *abil-*, and *ity*. The status of *accept*, from this point of view, is somewhat uncertain. Given the existence of such forms as *accede* and *accuse*, on the one hand, and of *except*, *excede*, and *excuse*, on the other, one might be inclined to analyze *accept* into *ac-* (which might subsequently be recognized as a variant of *ad-*) and *-cept*. The question is left open. Minimal grammatical units like *un-*, *abil-*, and *-ity* are what Bloomfield called mor-

phemes; he defined them in terms of the "partial phonetic-semantic resemblance" holding within sets of words. For example, "unacceptable," "untrue," and "ungracious" are phonetically (or, phonologically) similar as far as the first syllable is concerned and are similar in meaning in that each of them is negative by contrast with a corresponding positive adjective ("acceptable," "true," "gracious"). This "partial phonetic-semantic resemblance" is accounted for by noting that the words in question contain the same morpheme (namely, *un-*) and that this morpheme has a certain phonological form and a certain meaning.

Bloomfield's definition of the morpheme in terms of "partial phonetic-semantic resemblance" was considerably modified and, eventually, abandoned entirely by some of his followers. Whereas Bloomfield took the morpheme to be an actual segment of a word, others defined it as being a purely abstract unit, and the term morph was introduced to refer to the actual word segments. The distinction between morpheme and morph (which is, in certain respects, parallel to the distinction between phoneme and phone) may be explained by means of an example. If a morpheme in English is posited with the function of accounting for the grammatical difference between singular and plural nouns, it may be symbolized by enclosing the term plural within brace brackets. Now the morpheme [plural] is represented in a number of different ways. Most plural nouns in English differ from the corresponding singular forms in that they have an additional final segment. In the written forms of these words, it is either *-s* or *-es* (*e.g.,* "cat" : "cats"; "dog" : "dogs"; "fish" : "fishes"). The word segments written *-s* or *-es* are morphs. So also is the word segment written *-en* in "oxen." All these morphs represent the same morpheme. But there are other plural nouns in English that differ from the corresponding singular forms in other ways (*e.g.,* "mouse" : "mice"; "criterion" : "criteria"; and so on) or not at all (*e.g.,* "this sheep" : "these sheep"). Within the post-Bloomfieldian framework no very satisfactory account of the formation of these nouns could be given. But it was clear that they contained (in some sense) the same morpheme as the more regular plurals.

Plural morphs in English

Morphs that are in complementary distribution and represent the same morpheme are said to be allomorphs of that morpheme. For example, the regular plurals of English nouns are formed by adding one of three morphs on to the form of the singular: /s/, /z/, or /iz/ (in the corresponding written forms both /s/ and /z/ are written *-s* and /iz/ is written *-es*). Their distribution is determined by the following principle: if the morph to which they are to be added ends in a "sibilant" sound (*e.g., s, z, sh, ch*), then the syllabic allomorph /iz/ is selected (*e.g., fish-es* /fiš-iz/, *match-es* /mač-iz/); otherwise the nonsyllabic allomorphs are selected, the voiceless allomorph /s/ with morphs ending in a voiceless consonant (*e.g., cat-s* /kat-s/) and the voiced allomorph /z/ with morphs ending in a vowel or voiced consonant (*e.g., flea-s* /fli-z/, *dog-s* /dog-z/). These three allomorphs, it will be evident, are in complementary distribution, and the alternation between them is determined by the phonological structure of the preceding morph. Thus the choice is phonologically conditioned.

Past participle morphs in English

Very similar is the alternation between the three principal allomorphs of the past participle ending, /id/, /t/, and /d/, all of which correspond to the *-ed* of the written forms. If the preceding morph ends with /t/ or /d/, then the syllabic allomorph /id/ is selected (*e.g., wait-ed* /weit-id/). Otherwise, if the preceding morph ends with a voiceless consonant, one of the nonsyllabic allomorphs is selected—the voiceless allomorph /t/ when the preceding morph ends with a voiceless consonant (*e.g., pack-ed* /pak-t/) and the voiced allomorph /d/ when the preceding morph ends with a vowel or voiced consonant (*e.g., row-ed* /rou-d/; *tame-d* /teim-d/). This is another instance of phonological conditioning. Phonological conditioning may be contrasted with the principle that determines the selection of yet another allomorph of the past participle morpheme. The final /n/ of *show-n* or *see-n* (which marks them as past participles) is not determined by the phonological structure of the morphs *show* and *see.* For each English word that is similar to "show" and "see" in this respect, it must be stated as a synchronically inexplicable fact that it selects the /n/ allomorph. This is called grammatical conditioning. There are various kinds of grammatical conditioning.

Alternation of the kind illustrated above for the allomorphs of the plural morpheme and the /id/, /d/, and /t/ allomorphs of the past participle is frequently referred to as morphophonemic. Some linguists have suggested that it should be accounted for not by setting up three allomorphs each with a distinct phonemic form but by setting up a single morph in an intermediate morphophonemic representation. Thus, the regular plural morph might be said to be composed of the morphophoneme /Z/ and the most common past-participle morph of the morphophoneme /D/. General rules of morphophonemic interpretation would then convert /Z/ and /D/ to their appropriate phonetic form according to context. This treatment of the question foreshadows, on the one hand, the stratificational treatment and, on the other, the generative approach, though they differ considerably in other respects.

An important concept in grammar and, more particularly, in morphology is that of free and bound forms. A bound form is one that cannot occur alone as a complete utterance (in some normal context of use). For example, *-ing* is bound in this sense, whereas *wait* is not, nor is *waiting.* Any form that is not bound is free. Bloomfield based his definition of the word on this distinction between bound and free forms. Any free form consisting entirely of two or more smaller free forms was said to be a phrase (*e.g.,* "poor John" or "ran away"), and phrases were to be handled within syntax. Any free form that was not a phrase was defined to be a word and to fall within the scope of morphology. One of the consequences of Bloomfield's definition of the word was that morphology became the study of constructions involving bound forms. The so-called isolating languages, which make no use of bound forms (*e.g.,* Vietnamese), would have no morphology.

Inflection and derivation

The principal division within morphology is between inflection and derivation (or word formation). Roughly speaking, inflectional constructions can be defined as yielding sets of forms that are all grammatically distinct forms of single vocabulary items, whereas derivational constructions yield distinct vocabulary items. For example, "sings," "singing," "sang," and "sung" are all inflectional forms of the vocabulary item traditionally referred to as "the verb to sing"; but "singer," which is formed from "sing" by the addition of the morph *-er* (just as "singing" is formed by the addition of *-ing*), is one of the forms of a different vocabulary item. When this rough distinction between derivation and inflection is made more precise, problems occur. The principal consideration, undoubtedly, is that inflection is more closely integrated with and determined by syntax. But the various formal criteria that have been proposed to give effect to this general principle are not uncommonly in conflict in particular instances, and it probably must be admitted that the distinction between derivation and inflection, though clear enough in most cases, is in the last resort somewhat arbitrary.

Bloomfield and most linguists have discussed morphological constructions in terms of processes. Of these, the most widespread throughout the languages of the world is affixation; *i.e.,* the attachment of an affix to a base. For example, the word "singing" can be described as resulting from the affixation of *-ing* to the base *sing.* (If the affix is put in front of the base, it is a prefix; if it is put after the base, it is a suffix; and if it is inserted within the base, splitting it into two discontinuous parts, it is an infix.) Other morphological processes recognized by linguists need not be mentioned here, but reference may be made to the fact that many of Bloomfield's followers from the mid-1940s were dissatisfied with the whole notion of morphological processes. Instead of saying that *-ing* was affixed to *sing* they preferred to say that *sing* and *-ing* co-occurred in a particular pattern or arrangement, thereby avoiding the implication that *sing* is in some sense prior to or more basic than *-ing.* The distinction of morpheme and morph (and the notion of allomorphs) was developed in order to make possible the description of the morphology and

syntax of a language in terms of "arrangements" of items rather than in terms of "processes" operating upon more basic items. Nowadays, the opposition to "processes" is, except among the stratificationalists, almost extinct. It has proved to be cumbersome, if not impossible, to describe the relationship between certain linguistic forms without deriving one from the other or both from some common underlying form, and most linguists no longer feel that this is in any way reprehensible.

Bloomfield's theory of syntax

Syntax. Syntax, for Bloomfield, was the study of free forms that were composed entirely of free forms. Central to his theory of syntax were the notions of form classes and constituent structure. (These notions were also relevant, though less central, in the theory of morphology.) Bloomfield defined form classes, rather imprecisely, in terms of some common "recognizable phonetic or grammatical feature" shared by all the members. He gave as examples the form class consisting of "personal substantive expressions" in English (defined as "the forms that, when spoken with exclamatory final pitch, are calls for a person's presence or attention"—*e.g.*, "John," "Boy," "Mr. Smith"); the form class consisting of "infinitive expressions" (defined as "forms which, when spoken with exclamatory final pitch, have the meaning of a command"—*e.g.*, "run," "jump," "come here"); the form class of "nominative substantive expressions" (*e.g.*, "John," "the boys"); and so on. It should be clear from these examples that form classes are similar to, though not identical with, the traditional parts of speech and that one and the same form can belong to more than one form class.

What Bloomfield had in mind as the criterion for form class membership (and therefore of syntactic equivalence) may best be expressed in terms of substitutability. Form classes are sets of forms (whether simple or complex, free or bound), any one of which may be substituted for any other in a given construction or set of constructions throughout the sentences of the language.

The smaller forms into which a larger form may be analyzed are its constituents, and the larger form is a construction. For example, the phrase "poor John" is a construction analyzable into, or composed of, the constituents "poor" and "John." Because there is no intermediate unit of which "poor" and "John" are constituents that is itself a constituent of the construction "poor John," the forms "poor" and "John" may be described not only as constituents but also as immediate constituents of "poor John." Similarly, the phrase "lost his watch" is composed of three word forms—"lost," "his," and "watch"—all of which may be described as constituents of the construction. Not all of them, however, are its immediate constituents. The forms "his" and "watch" combine to make the intermediate construction "his watch"; it is this intermediate unit that combines with "lost" to form the larger phrase "lost his watch." The immediate constituents of "lost his watch" are "lost" and "his watch"; the immediate constituents of "his watch" are the forms "his" and "watch." By the constituent structure of a phrase or sentence is meant the hierarchical organization of the smallest forms of which it is composed (its ultimate constituents) into layers of successively more inclusive units. Viewed in this way, the sentence "Poor John lost his watch" is more than simply a sequence of five word forms associated with a particular intonation pattern. It is analyzable into the immediate constituents "poor John" and "lost his watch," and each of these phrases is analyzable into its own immediate constituents and so on, until, at the last stage of the analysis, the ultimate constituents of the sentence are reached. The constituent structure of the whole sentence is represented by means of a tree diagram in Figure 1.

Constituents and immediate constituents

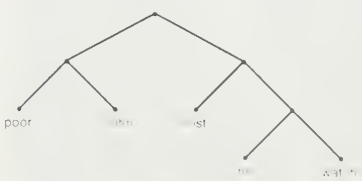


Figure 1: The constituent structure of a simple sentence (see text).

Each form, whether it is simple or composite, belongs to a certain form class. Using arbitrarily selected letters to denote the form classes of English, "poor" may be a member of the form class *A*, "John" of the class *B*, "lost" of the class *C*, "his" of the class *D*, and "watch" of the class *E*. Because "poor John" is syntactically equivalent to (*i.e.*, substitutable for) "John," it is to be classified as a member of *A*. So too, it can be assumed, is "his watch." In the case of "lost his watch" there is a problem. There are very many forms—including "lost," "ate," and "stole"—that can occur, as here, in constructions with a member of *B* and can also occur alone; for example, "lost" is substitutable for "stole the money," as "stole" is substitutable for either or for "lost his watch." This being so, one might decide to classify constructions like "lost his watch" as members of *C*. On the other hand, there are forms that—though they are substitutable for "lost," "ate," "stole," and so on when these forms occur alone—cannot be used in combination with a following member of *B* (*cf.* "died," "existed"); and there are forms that, though they may be used in combination with a following member of *B*, cannot occur alone (*cf.* "enjoyed"). The question is whether one respects the traditional distinction between transitive and intransitive verb forms. It may be decided, then, that "lost," "stole," "ate" and so forth belong to one class, *C* (the class to which "enjoyed" belongs), when they occur "transitively" (*i.e.*, with a following member of *B* as their object) but to a different class, *F* (the class to which "died" belongs), when they occur "intransitively." Finally, it can be said that the whole sentence "Poor John lost his watch" is a member of the form class *G*. Thus the constituent structure not only of "Poor John lost his watch" but of a whole set of English sentences can be represented by means of the tree diagram given in Figure 2. New sentences of the same type can be constructed by substituting actual forms for the class labels.

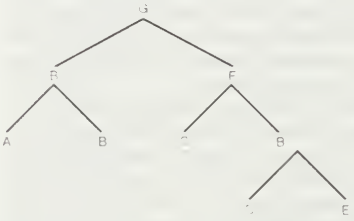

Figure 2: The constituent structure of a class of simple sentences with arbitrary letters used to represent the form class of each constituent (see text).

Endocentric and exocentric constructions

Any construction that belongs to the same form class as at least one of its immediate constituents is described as endocentric; the only endocentric construction in the model sentence above is "poor John." All the other constructions, according to the analysis, are exocentric. This is clear from the fact that in Figure 2 the letters at the nodes above every phrase other than the phrase *A* + *B* (*i.e.*, "poor John," "old Harry," and so on) are different from any of the letters at the ends of the lower branches connected directly to these nodes. For example, the phrase *D* + *E* (*i.e.*, "his watch," "the money," and so forth) has immediately above it a node labelled *B*, rather than either *D* or *E*. Endocentric constructions fall into two types: subordinating and coordinating. If attention is confined, for simplicity, to constructions composed of no more than two immediate constituents, it can be said that subordinating constructions are those in which only one immediate constituent is of the same form class as the whole construction, whereas coordinating constructions are those in which both constituents are of the same form class as the whole construction. In a subordinating construction (*e.g.*, "poor John"), the constituent that is syntactically equivalent to the whole construction is described as the head, and its partner is described as the modifier: thus, in "poor John," the form "John" is the head, and "poor" is its modifier. An example of a coordinating construction is "men and women," in which, it may be assumed, the immediate constituents are the word "men" and the word

"women," each of which is syntactically equivalent to "men and women." (It is here implied that the conjunction "and" is not a constituent, properly so called, but an element that, like the relative order of the constituents, indicates the nature of the construction involved. Not all linguists have held this view.)

Ambiguous constructions

One reason for giving theoretical recognition to the notion of constituent is that it helps to account for the ambiguity of certain constructions. A classic example is the phrase "old men and women," which may be interpreted in two different ways according to whether one associates "old" with "men and women" or just with "men." Under the first of the two interpretations, the immediate constituents are "old" and "men and women"; under the second, they are "old men" and "women." The difference in meaning cannot be attributed to any one of the ultimate constituents but results from a difference in the way in which they are associated with one another. Ambiguity of this kind is referred to as syntactic ambiguity. Not all syntactic ambiguity is satisfactorily accounted for in terms of constituent structure.

Semantics. Bloomfield thought that semantics, or the study of meaning, was the weak point in the scientific investigation of language and would necessarily remain so until the other sciences whose task it was to describe the universe and man's place in it had advanced beyond their present state. In his textbook *Language* (1933), he had himself adopted a behaviouristic theory of meaning, defining the meaning of a linguistic form as "the situation in which the speaker utters it and the response which it calls forth in the hearer." Furthermore, he subscribed, in principle at least, to a physicalist thesis, according to which all science should be modelled upon the so-called exact sciences and all scientific knowledge should be reducible, ultimately, to statements made about the properties of the physical world. The reason for his pessimism concerning the prospects for the study of meaning was his feeling that it would be a long time before a complete scientific description of the situations in which utterances were produced and the responses they called forth in their hearers would be available. At the time that Bloomfield was writing, physicalism was more widely held than it is today, and it was perhaps reasonable for him to believe that linguistics should eschew mentalism and concentrate upon the directly observable. As a result, for some 30 years after the publication of Bloomfield's textbook, the study of meaning was almost wholly neglected by his followers; most American linguists who received their training during this period had no knowledge of, still less any interest in, the work being done elsewhere in semantics.

Result of Bloomfield's physicalist tendencies

Two groups of scholars may be seen to have constituted an exception to this generalization: anthropologically minded linguists and linguists concerned with Bible translation. Much of the description of the indigenous languages of America has been carried out since the days of Boas and his most notable pupil Sapir by scholars who were equally proficient both in anthropology and in descriptive linguistics; such scholars have frequently added to their grammatical analyses of languages some discussion of the meaning of the grammatical categories and of the correlations between the structure of the vocabularies and the cultures in which the languages operated. It has already been pointed out that Boas and Sapir and, following them, Whorf were attracted by Humboldt's view of the interdependence of language and culture and of language and thought. This view was quite widely held by American anthropological linguists (athough many of them would not go as far as Whorf in asserting the dependence of thought and conceptualization upon language).

Also of considerable importance in the description of the indigenous languages of America has been the work of linguists trained by the American Bible Society and the Summer Institute of Linguistics, a group of Protestant missionary linguists. Because their principal aim is to produce translations of the Bible, they have necessarily been concerned with meaning as well as with grammar and phonology. This has tempered the otherwise fairly orthodox Bloomfieldian approach characteristic of the group.

The two most important developments evident in recent work in semantics are, first, the application of the structural approach to the study of meaning and, second, a better appreciation of the relationship between grammar and semantics. The second of these developments will be treated in the following section on *Transformational-generative grammar.* (See also the separate section below, *Semantics.*) The first, structural semantics, goes back to the period preceding World War II and is exemplified in a large number of publications, mainly by German scholars—Jost Trier, Leo Weisgerber, and their collaborators.

The structural approach to semantics is best explained by contrasting it with the more traditional "atomistic" approach, according to which the meaning of each word in the language is described, in principle, independently of the meaning of all other words. The structuralist takes the view that the meaning of a word is a function of the relationships it contracts with other words in a particular lexical field, or subsystem, and that it cannot be adequately described except in terms of these relationships. For example, the colour terms in particular languages constitute a lexical field, and the meaning of each term depends upon the place it occupies in the field. Although the denotation of each of the words "green," "blue," and "yellow" in English is somewhat imprecise at the boundaries, the position that each of them occupies relative to the other terms in the system is fixed: "green" is between "blue" and "yellow," so that the phrases "greenish yellow" or "yellowish green" and "bluish green" or "greenish blue" are used to refer to the boundary areas. Knowing the meaning of the word "green" implies knowing what cannot as well as what can be properly described as green (and knowing of the borderline cases that they are borderline cases). Languages differ considerably as to the number of basic colour terms that they recognize, and they draw boundaries within the psychophysical continuum of colour at different places. Blue, green, yellow, and so on do not exist as distinct colours in nature, waiting to be labelled differently, as it were, by different languages; they come into existence, for the speakers of particular languages, by virtue of the fact that those languages impose structure upon the continuum of colour and assign to three of the areas thus recognized the words "blue," "green," "yellow."

Colour terms in different languages

The language of any society is an integral part of the culture of that society, and the meanings recognized within the vocabulary of the language are learned by the child as part of the process of acquiring the culture of the society in which he is brought up. Many of the structural differences found in the vocabularies of different languages are to be accounted for in terms of cultural differences. This is especially clear in the vocabulary of kinship (to which a considerable amount of attention has been given by anthropologists and linguists), but it holds true of many other semantic fields also. A consequence of the structural differences that exist between the vocabularies of different languages is that, in many instances, it is in principle impossible to translate a sentence "literally" from one language to another.

It is important, nevertheless, not to overemphasize the semantic incommensurability of languages. Presumably, there are many physiological and psychological constraints that, in part at least, determine one's perception and categorization of the world. It may be assumed that, when one is learning the denotation of the more basic words in the vocabulary of one's native language, attention is drawn first to what might be called the naturally salient features of the environment and that one is, to this degree at least, predisposed to identify and group objects in one way rather than another. It may also be that human beings are genetically endowed with rather more specific and linguistically relevant principles of categorization. It is possible that, although languages differ in the number of basic colour categories that they distinguish, there is a limited number of hierarchically ordered basic colour categories from which each language makes its selection and that what counts as a typical instance, or focus, of these universal colour categories is fixed and does not vary from one language to another. If this hypothesis is correct, then it is false to say, as many structural semanticists have said, that languages divide the continuum of colour in a quite

arbitrary manner. But the general thesis of structuralism is unaffected, for it still remains true that each language has its own unique semantic structure even though the total structure is, in each case, built upon a substructure of universal distinctions.

TRANSFORMATIONAL-GENERATIVE GRAMMAR

A generative grammar, in the sense in which Noam Chomsky uses the term, is a rules system formalized with mathematical precision that generates, without need of any information that is not represented explicitly in the system, the grammatical sentences of the language that it describes, or characterizes, and assigns to each sentence a structural description, or grammatical analysis. All the concepts introduced in this definition of "generative" grammar will be explained and exemplified in the course of this section. Generative grammars fall into several types; this exposition is concerned mainly with the type known as transformational (or, more fully, transformational-generative). Transformational grammar was initiated by Zellig S. Harris in the course of work on what he called discourse analysis (the formal analysis of the structure of continuous text). It was further developed and given a somewhat different theoretical basis by Chomsky.

Generation of grammatical sentences

Harris's grammar. Harris distinguished within the total set of grammatical sentences in a particular language (for example, English) two complementary subsets: kernel sentences (the set of kernel sentences being described as the kernel of the grammar) and nonkernel sentences. The difference between these two subsets lies in nonkernel sentences being derived from kernel sentences by means of transformational rules. For example, "The workers rejected the ultimatum" is a kernel sentence that may be transformed into the nonkernel sentences "The ultimatum was rejected by the workers" or "Did the workers reject the ultimatum?" Each of these may be described as a transform of the kernel sentence from which it is derived. The transformational relationship between corresponding active and passive sentences (*e.g.*, "The workers rejected the ultimatum" and "The ultimatum was rejected by the workers") is conventionally symbolized by the rule N_1 V $N_2 \rightarrow N_2$ be V + en by N_1, in which N stands for any noun or noun phrase, V for any transitive verb, en for the past participle morpheme, and the arrow (→) instructs one to rewrite the construction to its left as the construction to the right. (There has been some simplification of the rule as it was formulated by Harris.) This rule may be taken as typical of the whole class of transformational rules in Harris's system: it rearranges constituents (what was the first nominal, or noun, N_1, in the kernel sentence is moved to the end of the transform, and what was the second nominal, N_2, in the kernel sentence is moved to initial position in the transform), and it adds various elements in specified positions (be, en, and by). Other operations carried out by transformational rules include the deletion of constituents; *e.g.*, the entire phrase "by the workers" is removed from the sentence "The ultimatum was rejected by the workers" by a rule symbolized as N_2 be V+en by $N_1 \rightarrow N_2$ be V+en. This transforms the construction on the left side of the arrow (which resulted from the passive transformation) by dropping the by-phrase, thus producing "The ultimatum was rejected."

Functions of Harris's rules

Chomsky's grammar. Chomsky's system of transformational grammar, though it was developed on the basis of his work with Harris, differs from Harris's in a number of respects. It is Chomsky's system that has attracted the most attention and has received the most extensive exemplification and further development. As outlined in *Syntactic Structures* (1957), it comprised three sections, or components: the phrase-structure component, the transformational component, and the morphophonemic component. Each of these components consisted of a set of rules operating upon a certain "input" to yield a certain "output." The notion of phrase structure may be dealt with independently of its incorporation in the larger system. In the following system of rules, S stands for Sentence, NP for Noun Phrase, VP for Verb Phrase, Det for Determiner, Aux for Auxiliary (verb), N for Noun, and V for Verb stem.

(1) S → NP + VP
(2) VP → Verb + NP
(3) NP → Det + N
(4) Verb → Aux + V
(5) Det → *the, a, . . .*
(6) N → *man, ball, . . .*
(7) Aux → *will, can, . . .*
(8) V → *hit, see, . . .*

This is a simple phrase-structure grammar. It generates and thereby defines as grammatical such sentences as "The man will hit the ball," and it assigns to each sentence that it generates a structural description. The kind of structural description assigned by a phrase-structure grammar is, in fact, a constituent structure analysis of the sentence.

In these rules, the arrow can be interpreted as an instruction to rewrite (this is to be taken as a technical term) whatever symbol appears to the left of the arrow as the symbol or string of symbols that appears to the right of the arrow. For example, rule (2) rewrites the symbol VP as the string of symbols Verb + NP, and it thereby defines Verb + NP to be a construction of the type VP. Or, alternatively and equivalently, it says that constructions of the type VP may have as their immediate constituents constructions of the type Verb and NP (combined in that order). Rule (2) can be thought of as creating or being associated with the tree structure in Figure 3.

Figure 3: The constituent structure, or phrase structure, assigned by the rule VP → Verb + NP (see text).

Rules (1)–(8) do not operate in isolation but constitute an integrated system. The symbol S (standing mnemonically for "sentence") is designated as the initial symbol. This information is not given in the rules (1)–(8), but it can be assumed either that it is given in a kind of protocol statement preceding the grammatical rules or that there is a universal convention according to which S is always the initial symbol. It is necessary to begin with a rule that has the initial symbol on the left. Thereafter any rule may be applied in any order until no further rule is applicable; in doing so, a derivation can be constructed of one of the sentences generated by the grammar. If the rules are applied in the following order: (1), (2), (3), (3), (4), (5), (5), (6), (6), (7), (8), then assuming that "the" is selected on both applications of (5), "man" on one application of (6), and "ball" on the other, "will" on the application of (7), and "hit" on the application of (8), the following derivation of the sentence "The man will hit the ball" will have been constructed:

Integrated system of rules

(i)	S	
(ii)	NP + VP	by rule (1)
(iii)	NP + Verb + NP	by rule (2)
(iv)	Det + N + Verb + NP	by rule (3)
(v)	Det + N + Verb + Det + N	by rule (3)
(vi)	Det + N + Aux + V + Det + N	by rule (4)
(vii)	*the* + N + Aux + V + Det + N	by rule (5)
(viii)	*the* + N + Aux + V + *the* + N	by rule (5)
(ix)	*the* + *man* + Aux + V + *the* + N	by rule (6)
(x)	*the* + *man* + Aux + V + *the* + *ball*	by rule (6)
(xi)	*the* + *man* + *will* + V + *the* + *ball*	by rule (7)
(xii)	*the* + *man* + *will* + *hit* + *the* + *ball*	by rule (8)

Many other derivations of this sentence are possible, depending on the order in which the rules are applied. The important point is that all these different derivations are equivalent in that they can be reduced to the same tree diagram; namely, the one shown in Figure 4. If this is compared with the system of rules, it will be seen that each application of each rule creates or is associated with a portion (or subtree) of the tree. The tree diagram, or phrase marker, may now be considered as a structural description of the sentence "The man hit the ball." It is a description of the constituent structure, or phrase structure, of the sentence, and it is assigned by the rules that generate the sentence.

It is important to interpret the term generate in a static, rather than a dynamic, sense. The statement that the

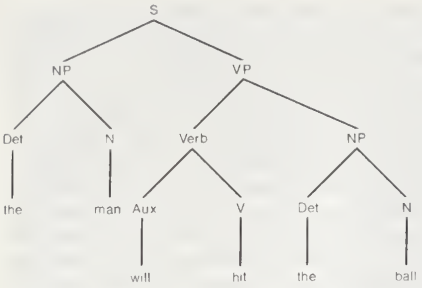

Figure 4: Structural description of the sentence "The man will hit the ball," assigned by the rules of a simple phrase-structure grammar (see text).

grammar generates a particular sentence means that the sentence is one of the totality of sentences that the grammar defines to be grammatical or well formed. All the sentences are generated, as it were, simultaneously. The notion of generation must be interpreted as would be a mathematical formula containing variables. For example, in evaluating the formula $y^2 + y$ for different values of y, one does not say that the formula itself generates these various resultant values (2, when $y = 1$; 5, when $y = 2$; etc.) one after another or at different times; one says that the formula generates them all simultaneously or, better still perhaps, timelessly. The situation is similar for a generative grammar. Although one sentence rather than another can be derived on some particular occasion by making one choice rather than another at particular places in the grammar, the grammar must be thought of as generating all sentences statically or timelessly.

Phrase-structure and transformational rules

It has been noted that, whereas a phrase-structure grammar is one that consists entirely of phrase-structure rules, a transformational grammar (as formalized by Chomsky) includes both phrase-structure and transformational rules (as well as morphophonemic rules). The transformational rules depend upon the prior application of the phrase-structure rules and have the effect of converting, or transforming, one phrase marker into another. What is meant by this statement may be clarified first with reference to a purely abstract and very simple transformational grammar, in which the letters stand for constituents of a sentence (and S stands for "sentence"):

PS rules
(1) $S \rightarrow A + B$
(2) $B \rightarrow C + D$
(3) $A \rightarrow a + b$
(4) $C \rightarrow c + e + f$
(5) $D \rightarrow d + g + h$
T rules
(6) $A + C + D \rightarrow D + A$

The first five rules are phrase-structure rules (PS rules); rule (6) is a transformational rule (T rule). The output of rules (1)–(5) is the terminal string $a + b + c + e + f + d + g + h$, which has associated with it the structural description indicated by the phrase marker shown in Figure 5 (left). Rule (6) applies to this terminal string of the PS rules and the associated phrase marker. It has the effect of deleting C (and the constituents of C) and permuting A and D (together with their constituents). The result is the string of symbols $d + g + h + a + b$, with the associated phrase marker shown in Figure 5 (right).

The phrase marker shown in Figure 5 (left) may be described as underlying, and the phrase marker shown in Figure 5 (right) as derived with respect to rule (6). One of the principal characteristics of a transformational rule is its transformation of an underlying phrase marker into a derived phrase marker in this way. Transformational rules, in contrast with phrase-structure rules, are also formally more heterogeneous and may have more than one symbol on the left-hand side of the arrow. The linguistic importance of these abstract considerations may be explained with reference to the relationship that holds in English between active and passive sentences.

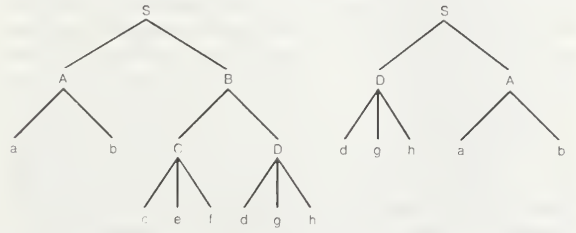

Figure 5: *Phrase markers.*
(Left) A phrase marker associated with the terminal string of a set of phrase-structure rules. (Right) The phrase marker resulting from the application to the phrase marker shown at left of the transformational rule $A + C + D \rightarrow D + A$ (see text).

Chomsky's rule for relating active and passive sentences (as given in *Syntactic Structures*) is very similar, at first sight, to Harris's, discussed above. Chomsky's rule is:

$$NP_1 - Aux - V - NP_2 \rightarrow NP_2 - Aux + be + en - V - by + NP_1$$

Passive transformation

This rule, called the passive transformation, presupposes and depends upon the prior application of a set of phrase-structure rules. For simplicity, the passive transformation may first be considered in relation to the set of terminal strings generated by the phrase-structure rules (1)–(8) given earlier. The string "the + man + will + hit + the + ball" (with its associated phrase marker, as shown in Figure 4) can be treated not as an actual sentence but as the structure underlying both the active sentence "The man will hit the ball" and the corresponding passive "The ball will be hit by the man." The passive transformation is applicable under the condition that the underlying, or "input," string is analyzable in terms of its phrase structure as NP – Aux – V – NP (the use of subscript numerals to distinguish the two NPs in the formulation of the rule is an informal device for indicating the operation of permutation). In the phrase marker in Figure 4 "the" + "man" are constituents of NP, "will" is a constituent of Aux, "hit" is a constituent of V, and "the" + "ball" are constituents of NP. The whole string is therefore analyzable in the appropriate sense, and the passive transformation converts it into the string "the + ball + will + be + en + hit + by + the + man." A subsequent transformational rule will permute "en + hit" to yield "hit + en," and one of the morphophonemic rules will then convert "hit + en" to "hit" (as "ride + en" will be converted to "ridden"; "open + en" to "opened," and so on).

Every transformational rule has the effect of converting an underlying phrase marker into a derived phrase marker. The manner in which the transformational rules assign derived constituent structure to their input strings is one of the major theoretical problems in the formalization of transformational grammar. Here it can be assumed not only that "be + en" is attached to Aux and "by" to NP (as indicated by the plus signs in the rule as it has been formulated above) but also that the rest of the derived structure is as shown in Figure 6. The phrase marker in Figure 6 formalizes the fact, among others, that "the ball" is the subject of the passive sentence "The ball will be hit by the man," whereas "the man" is the subject of the corresponding active "The man will hit the ball" (*cf.* Figure 4).

Although the example above is a very simple one, and only a single transformational rule has been considered independently of other transformational rules in the same system, the passive transformation must operate, not only upon simple noun phrases like "the man" or "the ball," but upon noun phrases that contain adjectives ("the old man"), modifying phrases ("the man in the corner"), relative clauses ("the man who checked in last night"), and so forth. The incorporation, or embedding, of these other structures with the noun phrase will be brought about by the prior application of other transformational rules. It should also be clear that the phrase-structure rules require extension to allow for the various forms of the verb ("is hitting," "hit," "was hitting," "has hit," "has been hitting," etc.) and for the distinction of singular and plural.

Operation of transformations on underlying structures

It is important to note that, unlike Harris's, Chomsky's system of transformational grammar does not convert one sentence into another: the transformational rules operate upon the structures underlying sentences and not upon actual sentences. A further point is that even the simplest sentences (*i.e.*, kernel sentences) require the application of

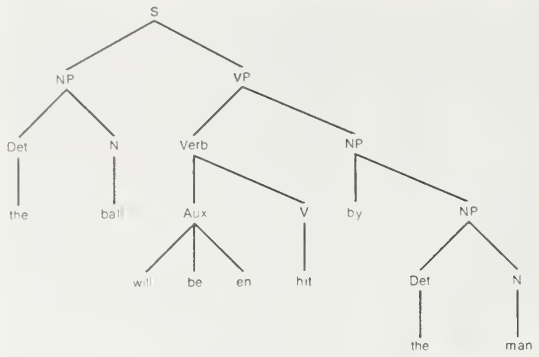

Figure 6: A possible derived phrase marker for a passive sentence (see text).

at least some transformational rules. Corresponding active and passive sentences, affirmative and negative sentences, declarative and interrogative sentences, and so on are formally related by deriving them from the same underlying terminal string of the phrase-structure component. The difference between kernel sentences and nonkernel sentences in *Syntactic Structures* (in Chomsky's later system the category of kernel sentences is not given formal recognition at all) resides in the fact that kernel sentences are generated without the application of any optional transformations. Nonkernel sentences require the application of both optional and obligatory transformations, and they differ one from another in that a different selection of optional transformations is made.

Modifications in Chomsky's grammar. Chomsky's system of transformational grammar was substantially modified in 1965. Perhaps the most important modification was the incorporation, within the system, of a semantic component, in addition to the syntactic component and phonological component. (The phonological component may be thought of as replacing the morphophonemic component of *Syntactic Structures*.) The rules of the syntactic component generate the sentences of the language and assign to each not one but two structural analyses: a deep structure analysis as represented by the underlying phrase marker, and a surface structure analysis, as represented by the final derived phrase marker. The underlying phrase marker is assigned by rules of the base (roughly equivalent to the PS [Phrase-Structure] rules of the earlier system); the derived phrase marker is assigned by the transformational rules. The interrelationship of the four sets of rules is shown diagrammatically in Figure 7. The

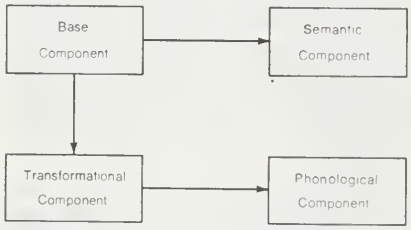

Figure 7: Diagrammatic representation of a transformational grammar (see text).

meaning of the sentence is derived (mainly, if not wholly) from the deep structure by means of the rules of semantic interpretation; the phonetic realization of the sentence is derived from its surface structure by means of the rules of the phonological component. The grammar ("grammar" is now to be understood as covering semantics and phonology, as well as syntax) is thus an integrated system of rules for relating the pronunciation of a sentence to its meaning. The syntax, and more particularly the base, is at the "heart" of the system, as it were: it is the base component (as the arrows in the diagram indicate) that generates the infinite class of structures underlying the well-formed sentences of a language. These structures are then given a semantic and phonetic "interpretation" by the other components.

The base consists of two parts: a set of categorial rules and a lexicon. Taken together, they fulfill a similar function to that fulfilled by the phrase-structure rules of the earlier system. But there are many differences of detail. Among the most important is that the lexicon (which may be thought of as a dictionary of the language cast in a particular form) lists, in principle, all the vocabulary words in the language and associates with each all the syntactic, semantic, and phonological information required for the correct operation of the rules. This information is represented in terms of what are called features. For example, the entry for "boy" might say that it has the syntactic features: [+ Noun], [+ Count], [+ Common], [+ Animate], and [+ Human]. The categorial rules generate a set of phrase markers that have in them, as it were, a number of "slots" to be filled with items from the lexicon. With each such "slot" there is associated a set of features that define the kind of item that can fill the "slot." If a phrase marker is generated with a "slot" for the head of a noun phrase specified as requiring an animate noun (*i.e.*, a noun having the feature [+ Animate]), the item "boy" would be recognized as being compatible with this specification and could be inserted in the "slot" by the rule of lexical substitution. Similarly, it could be inserted in "slots" specified as requiring a common noun, a human noun, or a countable noun, but it would be excluded from positions that require an abstract noun (*e.g.*, "sincerity") or an uncountable noun (*e.g.*, "water"). By drawing upon the syntactic information coded in feature notation in the lexicon, the categorial rules might permit such sentences as "The boy died," while excluding (and thereby defining as ungrammatical) such nonsentences as "The boy elapsed."

Base: categorial rules and a lexicon

One of the most controversial topics in the development of transformational grammar is the relationship between syntax and semantics. Scholars working in the field are now agreed that there is a considerable degree of interdependence between the two, and the problem is how to formalize this interdependence. One school of linguists, called generative semanticists, accept the general principles of transformational grammar but have challenged Chomsky's conception of deep structure as a separate and identifiable level of syntactic representation. In their opinion, the basic component of the grammar should consist of a set of rules for the generation of well-formed semantic representations. These would then be converted by a succession of transformational rules into strings of words with an assigned surface-structure syntactic analysis, there being no place in the passage from semantic representation to surface structure identifiable as Chomsky's deep structure. Chomsky himself has denied that there is any real difference between the two points of view and has maintained that the issue is purely one of notation. That this argument can be put forward by one party to the controversy and rejected by the other is perhaps a sufficient indication of the uncertainty of the evidence. Of greater importance than the overt issues, in so far as they are clear, is the fact that linguists are now studying much more intensively than they have in the past the complexities of the interdependence of syntax, on the one hand, and semantics and logic, on the other. Whether it will prove possible to handle all these complexities within a comprehensive generative grammar remains to be seen.

Generative semanticists

The role of the phonological component of a generative grammar of the type outlined by Chomsky is to assign a phonetic "interpretation" to the strings of words generated by the syntactic component. These strings of words are represented in a phonological notation (taken from the lexicon) and have been provided with a surface-structure analysis by the transformational rules (see Figure 7). The phonological elements out of which the word forms are composed are segments consisting of what are referred to technically as distinctive features (following the usage of the Prague school, see below). For example, the word form "man," represented phonologically, is composed of three segments: the first consists of the features [+ consonantal], [+ bilabial], [+ nasal], etc.; the second of the features [+ vocalic], [+ front], [+ open], etc.; and the third of the features [+ consonantal], [+ alveolar], [+ nasal], etc. (These features should be taken as purely illustrative; there is some doubt about the definitive list of distinctive

features.) Although these segments may be referred to as the "phonemes" /m/, /a/, and /n/, they should not be identified theoretically with units of the kind discussed in the section on *Phonology* under *Structural linguistics*. They are closer to what many American structural linguists called "morphophonemes" or the Prague school linguists labelled "archiphonemes," being unspecified for any feature that is contextually redundant or predictable. For instance, the first segment of the phonological representation of "man" will not include the feature [+ voice]; because nasal consonants are always phonetically voiced in this position in English, the feature [+ voice] can be added to the phonetic specification by a rule of the phonological component.

Dependence of generative phonology on syntax

One further important aspect of generative phonology (*i.e.*, phonology carried out within the framework of an integrated generative grammar) should be mentioned: its dependence upon syntax. Most American structural phonologists made it a point of principle that the phonemic analysis of an utterance should be carried out without regard to its grammatical structure. This principle was controversial among American linguists and was not generally accepted outside America. Not only has the principle been rejected by the generative grammarians, but they have made the phonological description of a language much more dependent upon its syntactic analysis than has any other school of linguists. They have claimed, for example, that the phonological rules that assign different degrees of stress to the vowels in English words and phrases and alter the quality of the relatively unstressed vowel concomitantly must make reference to the derived constituent structure of sentences and not merely to the form class of the individual words or the places in which the word boundaries occur.

TAGMEMICS

The system of tagmemic analysis, as presented by Kenneth L. Pike, was developed for the analysis not only of language but of all of human behaviour that manifests the property of patterning. In the following treatment, only language will be discussed.

Modes of language. Every language is said to be trimodal—*i.e.*, structured in three modes: phonology, grammar, and lexicon. These modes are interrelated but have a considerable degree of independence and must be described in their own terms. Phonology and lexicon should not be seen as mere appendages to grammar, the former simply specifying which phonemes can combine to form morphemes (or morphs), and the latter simply listing the morphemes and other meaningful units with a description of their meaning. There are levels of structure in each of the modes, and the units of one level are not necessarily coterminous with those of another. Phonemes, for example, may combine to form syllables and syllables to form phonological words ("phonological word" is defined as the domain of some phonological process such as accentuation, assimilation, or dissimilation), but the morpheme (or morph) will not necessarily consist of an integral number of syllables, still less of a single syllable. Nor will the word as a grammatical unit necessarily coincide with the phonological word. Similarly, the units of lexical analysis, sometimes referred to as lexemes (in one sense of this term), are not necessarily identifiable as single grammatical units, whether as morphemes, words, or phrases. No priority, then, is ascribed to any one of the three modes.

Tagmeme defined

The originality of tagmemic analysis and the application of the term tagmeme is most clearly manifest in the domain of grammar. By a tagmeme is meant an element of a construction, the element in question being regarded as a composite unit, described in such terms as "slot-filler" or "function-class." For example, one of the tagmemes required for the analysis of English at the syntactic level might be noun-as-subject, in which "noun" refers to a class of substitutable, or paradigmatically related, morphemes or words capable of fulfilling a certain grammatical function, and "subject" refers to the function that may be fulfilled by one or more classes of elements. In the tagmeme noun-as-subject—which, using the customary tagmemic symbolism, may be represented as Subject:noun—the subject slot is filled by a noun. When a particular tagmeme is identified in the analysis of an actual utterance, it is said to be manifested by the particular member of the grammatical class that occurs in the appropriate slot in the utterance. For example, in the utterance "John is asleep," the subject tagmeme is manifested by the noun "John." Tagmemicists insist that tagmemes, despite their bipartite structure, are single units. In grammatical analysis, the distribution of tagmemes, not simply of classes, is stated throughout the sentences of the language. Subject:noun is a different tagmeme from Object:noun, as it is also a different tagmeme from Subject:pronoun.

Hierarchy of levels. Within the grammar of a language there is a hierarchy of levels, units of one level being composed of sequences of units of the level below. In many languages, five such levels are recognized, defined in terms of the following units: morpheme, word, phrase, clause, and sentence. (The term level is being used in a different sense from that in which it was used earlier to refer to phonology and grammar.) The difference between morphology and syntax is simply a difference between two of these five levels, no greater than the difference, for example, between the phrase level and the clause level. Normally, tagmemes at one level are manifested by units belonging to the level below: clause tagmemes by phrases, phrase tagmemes by words, and so on. Intermediate levels may, however, be skipped. For example, the subject tagmeme in a clause may be manifested by a single word in English (*e.g.*, "John," "water") and not necessarily by a phrase ("the young man").

It is also possible for there to be loop-backs in the grammatical hierarchy of a language. This means that a unit of higher level may be embedded within the structure of a unit of lower level; for example, a clause may fill a slot within a phrase (*e.g.*, "who arrived late," in "the man who arrived late").

Tagmemic notation

In regard to the notation of tagmemics, a construction is symbolized as a string of tagmemes (which commonly, though not necessarily, will be sequentially ordered according to the order in which elements manifesting the tagmemes occur in utterances). Each tagmeme is marked as obligatory or optional by having preposed to it a plus sign (+) or a plus-or-minus sign (±), respectively. For example, a formula representing the structure of a clause composed of an obligatory subject tagmeme, an obligatory predicate tagmeme, and an optional object tagmeme might be Cl = + S:n + P:v ± O:n (in which Cl stands for a clause of a certain type and n and v stand for the classes of nouns and verbs, respectively). This formula does not represent in any way the fact (if it is a fact) that the predicate tagmeme and object tagmeme together form a unit that is one of the two immediate constituents of the clause. It is one of the characteristic features of tagmemic grammar that it gives much less emphasis to the notion of constituent structure than other American approaches to grammatical analysis.

STRATIFICATIONAL GRAMMAR

This system of analysis (whose principal advocate is Sydney M. Lamb, a U.S. linguist) is called stratificational because it is based upon the notion that every language comprises a restricted number of structural layers or strata, hierarchically related in such a way that units or combinations of units on one stratum realize units or combinations of units of the next higher stratum. The number of strata may vary from language to language. Four strata have been recognized for English, and it is probable that all languages may have at least these four: the sememic, the lexemic, the morphemic, and the phonemic strata. The sememic stratal system constitutes the semology of the language; the lexemic and morphemic stratal systems constitute the grammar (in the narrower sense of this term); and the phonemic system constitutes the phonology. In some later stratificational work, the term grammar covers the three higher stratal systems—the sememic, the lexemic, and the morphemic—and is opposed to "phonology." The deep structure of sentences is described on the sememic stratum and the surface structure on the morphemic. In the present account, "grammar" is used in

Sememic, lexemic, morphemic, and phonemic strata

the narrower sense and will be opposed to "semology" as well as "phonology."

The originality of stratificational grammar does not reside in the recognition of these three major components of a linguistic description. The stratificational approach to linguistic description is distinguished from others in that it relates grammar to semology and phonology by means of the same notion of realization that it employs to relate the lexemic and the morphemic stratal systems within the grammatical component. Another distinguishing feature of stratificational grammar, in its later development at least, is its description of linguistic structure in terms of a network of relationships, rather than by means of a system of rules; linguistic units are said to be nothing more than points, or positions, in the relational network.

Technical terminology. Lamb has been very careful to make the terminology of stratificational grammar as consistent and perspicuous as possible; but, in fitting some of the more or less established terms into his own theoretical framework, he has reinterpreted them in a potentially confusing manner. Thus, the same terms have been used in different senses in different versions of the system. For example, "morpheme" in stratificational grammar corresponds neither to the unit to which Bloomfield applied the term (*i.e.*, to a word segment consisting of phonemes) nor to the more abstract grammatical unit that a Bloomfieldian morpheme might be described as representing (*e.g.*, the past-tense morpheme that might be variously represented by such allomorphs as /id/, /t/, /d/, etc.). Lamb describes the morpheme as a unit composed of morphons (roughly equivalent to what other linguists have called morphophonemes) that is related to a combination of one or more compositional units of the stratum above, lexons, by means of the relationship of realization. For example, the word form "hated" realizes (on the morphemic stratum) a combination of two lexons, one of which, the stem, realizes the lexeme HATE and the other, the suffix, realizes the PAST TENSE lexeme; each of these two lexons is realized on the stratum below by a morpheme. Another example brings out more clearly the difference between morphemes (the minimal grammatical elements) and lexemes (the minimal meaningful elements). The word form "understood" realizes a combination of three morphemes UNDER, STAND, and PAST. UNDER and STAND jointly realize the single lexeme UNDERSTAND (whose meaning cannot be described as a function of the meanings of UNDER and STAND), whereas the single PAST morpheme directly realizes the single lexeme PAST TENSE.

Morpheme defined in stratificational terms

The stratificational framework, presented in Lamb's work, consistently separates compositional and realizational units, the former being designated by terms ending in the suffix *-on* (semon, lexon, morphon, phonon), the latter by terms ending in the suffix *-eme* (sememe, lexeme, morpheme, phoneme). Ons are components or compounds of emes on the same stratum (semons are components of sememes, lexons are composed of lexemes, etc.) and emes realize ons of the stratum above (phonemes realize morphons, morphemes realize lexons, etc.). Each stratum has its own combinatorial pattern specifying the characteristic combinations of elements on that stratum. Syllable structure is specified on the phonemic stratum, the structure of word forms on the morphemic stratum, the structure of phrases on the lexemic stratum, and the structure of clauses and sentences on the sememic stratum. Phonons are roughly equivalent to phonological distinctive features and include such properties or components of phonemes as labial, nasal, and so on. Sememes are roughly equivalent to what other linguists have called semantic components or features and include such aspects of the meaning of the lexeme "man" as "male," "adult," "human," and so forth. Once again, however, compositional function is distinguished from interstratal realizational function, so that no direct equivalence can be established with nonstratificational terminology. In more recent work in stratificational grammar, the notion that emes are composed of ons has been abandoned, and greater emphasis is laid upon the fact that emes are points, or positions, in a relational network; they are connected to other points in the network but have themselves no internal structure.

Interstratal relationships. One of the principal characteristics of the stratificational approach is that it sets out to describe languages without making use of rules that convert one entity into another. (Reference has been made above to the antipathy many linguists have felt towards describing languages in terms of processes.) The stratificationalist would handle the phenomena in terms of the interstratal relationships of realization. Various kinds of interstratal relationships, other than that of one-to-one correspondence may be recognized: diversification, in which one higher unit has alternative realizations; zero realization, in which a higher unit has no overt realization on the lower stratum; neutralization, in which two or more higher units are mapped into the same lower level unit; and so on. All these interstratal one–many or many–one relations are then analyzed in terms of the logical notions of conjunction and disjunction (AND-relations versus OR-relations), of ordering (*x* precedes *y* in an AND-relationship, *x* is selected in preference to *y* in an OR-relationship), and the directionality ("upward" towards meaning, or "downward" towards sound). Many of the phenomena that are described by other linguists in terms of processes that derive one unit from another can be described elegantly enough in terms of interstratal relationships of this kind.

Types of interstratal relationships

Critics, however, have objected to the proliferation of strata and theoretical constructs in stratificational grammar, arguing that they result from an a priori commitment to the notion of realization and that the only stratal distinction for which there is any independent evidence is the distinction of phonology and grammar. It has been suggested by Lamb that stratificational grammar provides a model for the way in which linguistic information is stored in the brain and activated during the production and reception of speech. But little is known yet about the neurology of language and speech, and it would be premature to draw any firm conclusions about this aspect of stratificational grammar (see below *Psycholinguistics*).

THE PRAGUE SCHOOL

What is now generally referred to as the Prague school comprises a fairly large group of scholars, mainly European, who, though they may not themselves have been members of the Linguistic Circle of Prague, derived their inspiration from the work of Vilém Mathesius, Nikolay Trubetskoy, Roman Jakobson and other scholars based in Prague in the decade preceding World War II.

Combination of structuralism and functionalism. The most characteristic feature of the Prague school approach is its combination of structuralism with functionalism. The latter term (like "structuralism") has been used in a variety of senses in linguistics. Here it is to be understood as implying an appreciation of the diversity of functions fulfilled by language and a theoretical recognition that the structure of languages is in large part determined by their characteristic functions. Functionalism, taken in this sense, manifests itself in many of the more particular tenets of Prague school doctrine.

One very famous functional analysis of language, which, though it did not originate in Prague, was very influential there, was that of the German psychologist Karl Bühler, who recognized three general kinds of function fulfilled by language: *Darstellungsfunktion*, *Kundgabefunktion*, and *Appelfunktion*. These terms may be translated, in the present context, as the cognitive, the expressive, and the conative (or instrumental) functions. The cognitive function of language refers to its employment for the transmission of factual information; by expressive function is meant the indication of the mood or attitude of the speaker (or writer); and by the conative function of language is meant its use for influencing the person one is addressing or for bringing about some practical effect. A number of scholars working in the Prague tradition have suggested that these three functions correlate in many languages, at least partly, with the grammatical categories of mood and person. The cognitive function is fulfilled characteristically by 3rd-person nonmodal utterances (*i.e.*, utterances in the indicative mood, making no use of modal verbs); the expressive function by 1st-person utterances in the subjunctive or optative mood; and the conative function by 2nd-person

Various functions of language

utterances in the imperative. The functional distinction of the cognitive and the expressive aspects of language has also been applied by Prague school linguists in their work on stylistics and literary criticism. One of their key principles is that language is being used poetically or aesthetically when the expressive aspect is predominant, and that it is typical of the expressive function of language that this should be manifest in the form of an utterance and not merely in the meanings of the component words.

Phonological contributions. The Prague school is best known for its work on phonology. Unlike the American phonologists, Trubetskoy and his followers did not take the phoneme to be the minimal unit of analysis. Instead, they defined phonemes as sets of distinctive features. For example, in English, /b/ differs from /p/ in the same way that /d/ differs from /t/ and /g/ from /k/. Just how they differ in terms of their articulation is a complex question. For simplicity, it may be said that there is just one feature, the presence of which distinguishes /b/, /d/, and /g/ from /p/, /t/, and /k/, and that this feature is voicing (vibration of the vocal cords). Similarly, the feature of labiality can be extracted from /p/ and /b/ by comparing them with /t/, /d/, /k/, and /g/; the feature of nasality from /n/ and /m/ by comparing them with /t/ and /d/, on the one hand, and with /p/ and /b/, on the other. Each phoneme, then, is composed of a number of articulatory features and is distinguished by the presence or absence of at least one feature from every other phoneme in the language. The distinctive function of phonemes, which depends upon and supports the principle of the duality of structure, can be related to the cognitive function of language. This distinctive feature analysis of Prague school phonology as developed by Jakobson has become part of the generally accepted framework for generative phonology (see above).

Phonemes as distinctive features

Two other kinds of phonologically relevant function are also recognized by linguists of the Prague school: expressive and demarcative. The former term is employed here in the sense in which it was employed above (*i.e.*, in opposition to "cognitive"); it is characteristic of stress, intonation, and other suprasegmental aspects of language that they are frequently expressive of the mood and attitude of the speaker in this sense. The term demarcative is applied to those elements or features that in particular languages serve to indicate the occurrence of the boundaries of words and phrases and, presumably, make it easier to identify such grammatical units in the stream of speech. There are, for example, many languages in which the set of phonemes that can occur at the beginning of a word differs from the set of phonemes that can occur at the end of a word. These and other devices are described by the Prague school phonologists as having demarcative function: they are boundary signals that reinforce the identity and syntagmatic unity of words and phrases.

Theory of markedness. The notion of markedness was first developed in Prague school phonology but was subsequently extended to morphology and syntax. When two phonemes are distinguished by the presence or absence of a single distinctive feature, one of them is said to be marked and the other unmarked for the feature in question. For example, /b/ is marked and /p/ unmarked with respect to voicing. Similarly, in morphology, the regular English verb can be said to be marked for past tense (by the suffixation of *-ed*) but to be unmarked in the present (*cf.* "jumped" versus "jump"). It is often the case that a morphologically unmarked form has a wider range of occurrences and a less definite meaning than a morphologically marked form. It can be argued, for example, that, whereas the past tense form in English (in simple sentences or the main clause of complex sentences) definitely refers to the past, the so-called present tense form is more neutral with respect to temporal reference: it is nonpast in the sense that it fails to mark the time as past, but it does not mark it as present. There is also a more abstract sense of markedness, which is independent of the presence or absence of an overt feature or affix. The words "dog" and "bitch" provide examples of markedness of this kind on the level of vocabulary. Whereas the use of the word "bitch" is restricted to females of the species, "dog" is applicable to both males and females. "Bitch" is the marked and "dog" the unmarked term, and, as is commonly the case, the unmarked term can be neutral or negative according to context (*cf.* "That dog over there is a bitch" versus "It's not a dog, it's a bitch"). The principle of markedness, understood in this more general or more abstract sense, is now quite widely accepted by linguists of many different schools, and it is applied at all levels of linguistic analysis.

Marked and unmarked features

Recent contributions. Current Prague school work is still characteristically functional in the sense in which this term was interpreted in the pre-World War II period. The most valuable contribution made by the postwar Prague school is probably the distinction of theme and rheme and the notion of "functional sentence perspective" or "communicative dynamism." By the theme of a sentence is meant that part that refers to what is already known or given in the context (sometimes called, by other scholars, the topic or psychological subject); by the rheme, the part that conveys new information (the comment or psychological predicate). It has been pointed out that, in languages with a free word order (such as Czech or Latin), the theme tends to precede the rheme, regardless of whether the theme or the rheme is the grammatical subject and that this principle may still operate, in a more limited way, in languages, like English, with a relatively fixed word order (*cf.* "That book I haven't seen before"). But other devices may also be used to distinguish theme and rheme. The rheme may be stressed ("Jóhn saw Mary") or made the complement of the verb "to be" in the main clause of what is now commonly called a cleft sentence ("It's Jóhn who saw Mary").

The general principle that has guided research in "functional sentence perspective" is that the syntactic structure of a sentence is in part determined by the communicative function of its various constituents and the way in which they relate to the context of utterance. A somewhat different but related aspect of functionalism in syntax is seen in current work in what is called case grammar. Case grammar is based upon a small set of syntactic functions (agentive, locative, benefactive, instrumental, and so on) that are variously expressed in different languages but that are held to determine the grammatical structure of sentences. Although case grammar does not derive directly from the work of the Prague school, it is very similar in inspiration.

Case grammar

Historical (diachronic) linguistics

LINGUISTIC CHANGE

All languages change in the course of time. Written records make it clear that 15th-century English is quite noticeably different from 20th-century English, as is 15th-century French or German from modern French or German. It was the principal achievement of the 19th-century linguists not only to realize more clearly than their predecessors the ubiquity of linguistic change but also to put its scientific investigation on a sound footing by means of the comparative method (see the section *History of linguistics: The 19th century*). This will be treated in greater detail in the following section. Here various kinds, or categories, of linguistic change will be listed and exemplified.

Sound change. Since the beginning of the 19th century, when scholars observed that there were a number of systematic correspondences in related words between the sounds of the Germanic languages and the sounds of what were later recognized as other Indo-European languages, particular attention has been paid in diachronic linguistics to changes in the sound systems of languages.

Certain common types of sound change, most notably assimilation and dissimilation, can be explained, at least partially, in terms of syntagmatic, or contextual, conditioning. By assimilation is meant the process by which one sound is made similar in its place or manner of articulation to a neighbouring sound. For example, the word "cupboard" was presumably once pronounced, as the spelling indicates, with the consonant cluster *pb* in the middle. The *p* was assimilated to *b* in manner of articulation (*i.e.*, voicing was maintained throughout the cluster), and subsequently the resultant double consonant *bb* was

simplified. With a single *b* in the middle and an unstressed second syllable, the word "cupboard," as it is pronounced nowadays, is no longer so evidently a compound of "cup" and "board" as its spelling still shows it to have been. The Italian words *notte* "night" and *otto* "eight" manifest assimilation of the first consonant to the second consonant of the cluster in place of articulation (*cf.* Latin *nocte(m), octo*). Assimilation is also responsible for the phenomenon referred to as umlaut in the Germanic languages. The high front vowel *i* of suffixes had the effect of fronting and raising preceding back vowels and, in particular, of converting an *a* sound into an *e* sound. In Modern German this is still a morphologically productive process (*cf. Mann* "man": *Männer* "men"). In English it has left its mark in such irregular forms as "men" (from **mannniz*), "feet" (from **fotiz*), and "length" (from **langþa*).

Umlaut

Dissimilation refers to the process by which one sound becomes different from a neighbouring sound. For example, the word "pilgrim" (French *pèlerin*) derives ultimately from the Latin *peregrinus;* the *l* sound results from dissimilation of the first *r* under the influence of the second *r*. A special case of dissimilation is haplology, in which the second of the two identical or similar syllables is dropped. Examples include the standard modern British pronunciations of "Worcester" and "Gloucester" with two syllables rather than three and the common pronunciation of "library" as if it were written "libry." Both assimilation and dissimilation are commonly subsumed under the principle of "ease of articulation." This is clearly applicable in typical instances of assimilation. It is less obvious how or why a succession of unlike sounds in contiguous syllables should be easier to pronounce than a succession of identical or similar sounds. But a better understanding of this phenomenon, as of other "slips of the tongue," may result from current work in the physiological and neurological aspects of speech production.

Not all sound change is to be accounted for in terms of syntagmatic conditioning. The change of *p, t,* and *k* to *f,* θ (the *th* sound in "thin"), and *h* or of *b, d, g* to *p, t,* and *k* in early Germanic cannot be explained in these terms. Nor can the so-called Great Vowel Shift in English, which, in the 15th century, modified the quality of all the long vowels (*cf.* "profane" : "profanity"; "divine" : "divinity"; and others). Attempts have been made to develop a general theory of sound change, notably by the French linguist André Martinet. But no such theory has yet won universal acceptance, and it is likely that the causes of sound change are multiple.

Phonetic vs. phonological sound change

Sound change is not necessarily phonological; it may be merely phonetic (see above *Structural linguistics: Phonology*). The pronunciation of one or more of the phones realizing a particular phoneme may change slightly without affecting any of the previously existing phonological distinctions; this no doubt happens quite frequently as a language is transmitted from one generation to the next. Two diachronically distinct states of the language would differ in this respect in the same way as two coexistent but geographically or socially distinct accents of the same language might differ. It is only when two previously distinct phonemes are merged or a unitary phoneme splits into two (typically when allophonic variation becomes phonemic) that sound change must definitely be considered as phonological. For example, the sound change of *p* to *f, t* to θ(*th*), and *k* to *h,* on the one hand, and of *b* to *p, d* to *t,* and *g* to *k,* on the other, in early Germanic had the effect of changing the phonological system. The voiceless stops did not become fricatives in all positions; they remained as voiceless stops after *s*. Consequently, the *p* sound that was preserved after *s* merged with the *p* that derived by sound change from *b*. (It is here assumed that the aspirated *p* sound and the unaspirated *p* sound are to be regarded as allophones of the same phoneme). Prior to the Germanic sound shift the phoneme to be found at the beginning of the words for "five" or "father" also occurred after *s* in words for "spit" or "spew"; after the change this was no longer the case.

Grammatical change. A language can acquire a grammatical distinction that it did not have previously, as when English developed the progressive ("He is running") in contrast to the simple present ("He runs"). It can also lose a distinction; *e.g.,* modern spoken French has lost the distinction between the simple past (*Il marcha* "he walked") and the perfect (*Il a marché* "he has walked"). What was expressed by means of one grammatical device may come to be expressed by means of another. For example, in the older Indo-European languages the syntactic function of the nouns and noun phrases in a sentence was expressed primarily by means of case endings (the subject of the sentence being in the nominative case, the object in the accusative case, and so on); in most of the modern Indo-European languages these functions are expressed by means of word order and the use of prepositions. It is arguable, although it can hardly be said to have been satisfactorily demonstrated yet, that the grammatical changes that take place in a language in the course of time generally leave its deep structure unaffected and tend to modify the ways in which the deeper syntactic functions and distinctions are expressed (whether morphologically, by word order, by the use of prepositions and auxiliary verbs, or otherwise), without affecting the functions and distinctions themselves. Many grammatical changes are traditionally accounted for in terms of analogy.

Semantic change. Towards the end of the 19th century, a French scholar, Michel Bréal, set out to determine the laws that govern changes in the meaning of words. This was the task that dominated semantic research until the 1930s, when scholars began to turn their attention to the synchronic study of meaning. Many systems for the classification of changes of meaning have been proposed, and a variety of explanatory principles have been suggested. So far no "laws" of semantic change comparable to the phonologist's sound laws have been discovered. It seems that changes of meaning can be brought about by a variety of causes. Most important, perhaps, and the factor that has been emphasized particularly by the so-called words-and-things movement in historical semantics is the change undergone in the course of time by the objects or institutions that words denote. For example, the English word "car" goes back through Latin *carrus* to a Celtic word for a four-wheeled wagon. It now denotes a very different sort of vehicle; confronted with a model of a Celtic wagon in a museum, one would not describe it as a car.

Causes of changes in meaning

Some changes in the meaning of words are caused by their habitual use in particular contexts. The word "starve" once meant "to die" (*cf.* Old English *steorfan,* German *sterben*); in most dialects of English, it now has the more restricted meaning "to die of hunger," though in the north of England "He was starving" can also mean "He was very cold" (*i.e.,* "dying" of cold, rather than hunger). Similarly, the word "deer" has acquired a more specialized meaning than the meaning "wild animal" that it once bore (*cf.* German *Tier*); and "meat," which originally meant food in general (hence, "sweetmeats" and the archaic phrase "meat and drink") now denotes the flesh of an animal treated as food. In all such cases, the narrower meaning has developed from the constant use of the word in a more specialized context, and the contextual presuppositions of the word have in time become part of its meaning.

Borrowing. Languages borrow words freely from one another. Usually this happens when some new object or institution is developed for which the borrowing language has no word of its own. For example, the large number of words denoting financial institutions and operations borrowed from Italian by the other western European languages at the time of the Renaissance testifies to the importance of the Italian bankers in that period. (The word "bank" itself, in this sense, comes through French from the Italian *banca*). Words now pass from one language to another on a scale that is probably unprecedented, partly because of the enormous number of new inventions that have been made in the 20th century and partly because international communications are now so much more rapid and important. The vocabulary of modern science and technology is very largely international.

THE COMPARATIVE METHOD

The comparative method in historical linguistics is concerned with the reconstruction of an earlier language or

Reconstruction of an earlier language

earlier state of a language on the basis of a comparison of related words and expressions in different languages or dialects derived from it. The comparative method was developed in the course of the 19th century for the reconstruction of Proto-Indo-European and was subsequently applied to the study of other language families. It depends upon the principle of regular sound change—a principle that, as explained above, met with violent opposition when it was introduced into linguistics by the Neogrammarians in the 1870s but by the end of the century had become part of what might be fairly described as the orthodox approach to historical linguistics. Changes in the phonological systems of languages through time were accounted for in terms of sound laws.

Grimm's law. The most famous of the sound laws is Grimm's law (though Grimm himself did not use the term law). Some of the correspondences accounted for by Grimm's law are given in Table 1. It will be observed that,

Table 1: Labial and Dental Stops in the Indo-European Languages

Greek	Latin	Gothic	Sanskrit	Slavic
p	p	f	p	p
b	b	p	b	b
ph	f/b	b	bh	b
t	t	O	t	t
d	d	t	d	d
th	f/d	d	dh	d

when other Indo-European languages, including Latin and Greek, have a voiced unaspirated stop (*b, d*), Gothic has the corresponding voiceless unaspirated stop (*p, t*) and that, when other Indo-European languages have a voiceless unaspirated stop, Gothic has a voiceless fricative (*f*, θ). The simplest explanation would seem to be that, under the operation of what is now called Grimm's law, in some prehistoric period of Germanic (before the development of a number of distinct Germanic languages), the voiced stops inherited from Proto-Indo-European became voiceless and the voiceless stops became fricatives. The situation with respect to the sounds corresponding to the Germanic voiced stops is more complex. Here there is considerable disagreement between the other languages: Greek has voiceless aspirates (*ph, th*), Sanskrit has voiced aspirates (*bh, dh*), Latin has voiceless fricatives in word-initial position (*f*) and voiced stops in medial position (*b, d*), Slavic has voiced stops (*b, d*), and so on. The generally accepted hypothesis is that the Proto-Indo-European sounds from which the Germanic voiced stops developed were voiced aspirates and that they are preserved in Sanskrit but were changed in the other Indo-European languages by the loss of either voice or aspiration. (Latin, having lost the voice in initial position, subsequently changed both of the resultant voiceless aspirates into the fricative *f*, and it lost the aspiration in medial position.) It is easy to see that this hypothesis yields a simpler account of the correspondences than any of the alternatives. It is also in accord with the fact that voiced aspirates are rare in the languages of the world and, unless they are supported by the coexistence in the same language of phonologically distinct voiceless aspirates (as they are in Hindi and other north Indian languages), appear to be inherently unstable.

Proto-Indo-European reconstruction. Reconstruction of the Proto-Indo-European labial stops (made with the lips) and dental stops (made with the tip of the tongue touching the teeth) is fairly straightforward. More controversial is the reconstruction of the Proto-Indo-European sounds underlying the correspondences shown in Table 2. Accord-

Table 2: Velar and Palatal Stops in the Indo-European Languages

Greek	Latin	Gothic	Sanskrit	Slavic
k	k	h	ś	s
g	g	k	j	z
kh	h/g/f	g	h	z
p/t/k	qu	wh	k	k
b/d/g	v/gu	q	g	g
ph/th/kh	f/v/gu	w	gh	g

Controversy concerning Proto-Indo-European velar consonants

ing to the most generally accepted hypothesis, there were in Proto-Indo-European at least two distinct series of velar (or "guttural") consonants: simple velars (or palatals), symbolized as **k, *g,* and **gh,* and labiovelars, symbolized as **k*^{w}, **g*^{w}, and **g*^{w}*h*. The labiovelars may be thought of as velar stops articulated with simultaneous lip-rounding. In one group of languages, the labial component is assumed to have been lost, in another group the velar component; and it is only in the Latin reflex of the voiceless **k*^{w} that both labiality and velarity are retained (*cf.* Latin *quis* from **k*^{w}*i-*). It is notable that the languages that have a velar for the Proto-Indo-European labiovelar stops (*e.g.,* Sanskrit and Slavic) have a sibilant or palatal sound (*s* or *ś*) for the Proto-Indo-European simple velars. Earlier scholars attached great significance to this fact and thought that it represented a fundamental division of the Indo-European family into a western and an eastern group. The western group—comprising Celtic, Germanic, Italic, and Greek—is commonly referred to as the centum group; the eastern group—comprising Sanskrit, Iranian, Slavic, and others—is called the satem (*satəm*) group. (The words centum and satem come from Latin and Iranian, respectively, and mean "hundred." They exemplify, with their initial consonant, the two different treatments of the Proto-Indo-European simple velars.) Nowadays less importance is attached to the centum–satem distinction. But it is still generally held that in an early period of Indo-European, there was a sound law operative in the dialect or dialects from which Sanskrit, Iranian, Slavic and the other so-called satem languages developed that had the effect of palatalizing the original Proto-Indo-European velars and eventually converting them to sibilants.

Steps in the comparative method. The information given in the previous paragraphs is intended to illustrate what is meant by a sound law and to indicate the kind of considerations that are taken into account in the application of the comparative method. The first step is to find sets of cognate or putatively cognate forms in the languages or dialects being compared: for example, Latin *decem* = Greek *deka* = Sanskrit *daśa* = Gothic *taihun,* all meaning "ten." From sets of cognate forms such as these, sets of phonological correspondences can be extracted; *e.g.,* (1) Latin *d* = Greek *d* = Sanskrit *d* = Gothic *t;* (2) Latin *e* = Greek *e* = Sanskrit *a* = Gothic *ai* (in the Gothic orthography this represents an *e* sound); (3) Latin *c* (*i.e.,* a *k* sound) = Greek *k* = Sanskrit *ś* = Gothic *h;* (4) Latin *em* = Greek *a* = Sanskrit *a* = Gothic *un.* A set of "reconstructed" phonemes can be postulated (marked with an asterisk by the standard convention) to which the phonemes in the attested languages can be systematically related by means of sound laws. The reconstructed Proto-Indo-European word for "ten" is **dekm.* From this form the Latin word can be derived by means of a single sound change, **m* changes to *em* (usually symbolized as **m* > *em*); the Greek by means of the sound change **m* > *a* (*i.e.,* vocalization of the syllabic nasal and loss of nasality); the Sanskrit by means of the palatalizing sound law, **k* > *ś* and the sound change **m* > *a* (whether this is assumed to be independent of the law operative in Greek or not); and the Gothic by means of Grimm's law (**d* > *t*, **k* > *h*) and the sound change **m* > *un.*

Phonological correspondences in cognate forms

Most 19th-century linguists took it for granted that they were reconstructing the actual word forms of some earlier language, that **dekm,* for example, was a pronounceable Proto-Indo-European word. Many of their successors have been more skeptical about the phonetic reality of reconstructed starred forms like **dekm.* They have said that they are no more than formulae summarizing the correspondences observed to hold between attested forms in particular languages and that they are, in principle, unpronounceable. From this point of view, it would be a matter of arbitrary decision which letter is used to refer to the correspondences: Latin *d* = Greek *d* = Sanskrit *d* = Gothic *t,* and so on. Any symbol would do, provided that a distinct symbol is used for each distinct set of correspondences. The difficulty with this view of reconstruction is that it seems to deny the very raison d'être of historical and comparative linguistics. Linguists want to know, if possible, not only that Latin *decem,* Greek *deka,* and so on are related,

but also the nature of their historical relationship—how they have developed from common ancestral form. They also wish to construct, if feasible, some general theory of sound change. This can be done only if some kind of phonetic interpretation can be given to the starred forms. The important point is that the confidence with which a phonetic interpretation is assigned to the phonemes that are reconstructed will vary from one phoneme to another. It should be clear from the discussion above, for example, that the interpretation of **d* as a voiced dental or alveolar stop is more certain than the interpretation of **k* as a voiceless velar stop. The starred forms are not all on an equal footing from a phonetic point of view.

Criticisms of the comparative method. One of the criticisms directed against the comparative method is that it is based upon a misleading genealogical metaphor. In the mid-19th century, the German linguist August Schleicher introduced into comparative linguistics the model of the "family tree." There is obviously no point in time at which it can be said that new languages are "born" of a common parent language. Nor is it normally the case that the parent language "lives on" for a while, relatively unchanged, and then "dies." It is easy enough to recognize the inappropriateness of these biological expressions. No less misleading, however, is the assumption that languages descended from the same parent language will necessarily diverge, never to converge again, through time. This assumption is built into the comparative method as it is traditionally applied. And yet there are many clear cases of convergence in the development of well-documented languages. The dialects of England are fast disappearing and are far more similar in grammar and vocabulary today than they were even a generation ago. They have been strongly influenced by the standard language. The same phenomenon, the replacement of nonstandard or less prestigious forms with forms borrowed from the standard language or dialect, has taken place in many different places at many different times. It would seem, therefore, that one must reckon with both divergence and convergence in the diachronic development of languages: divergence when contact between two speech communities is reduced or broken and convergence when the two speech communities remain in contact and when one is politically or culturally dominant.

Model of the family tree

The comparative method presupposes linguistically uniform speech communities and independent development after sudden, sharp cleavage. Critics of the comparative method have pointed out that this situation does not generally hold. In 1872 a German scholar, Johannes Schmidt, criticized the family-tree theory and proposed instead what is referred to as the wave theory, according to which different linguistic changes will spread, like waves, from a politically, commercially, or culturally important centre along the main lines of communication, but successive innovations will not necessarily cover exactly the same area. Consequently, there will be no sharp distinction between contiguous dialects, but, in general, the further apart two speech communities are, the more linguistic features there will be that distinguish them (see below *Dialectology and linguistic geography*).

Internal reconstruction. The comparative method is used to reconstruct earlier forms of a language by drawing upon the evidence provided by other related languages. It may be supplemented by what is called the method of internal reconstruction. This is based upon the existence of anomalous or irregular patterns of formation and the assumption that they must have developed, usually by sound change, from earlier regular patterns. For example, the existence of such patterns in early Latin as *honos* : *honoris* ("honor" : "of honor") and others in contrast with *orator* : *oratoris* ("orator" : "of the orator") and others might lead to the supposition that *honoris* developed from an earlier **honosis*. In this case, the evidence of other languages shows that **s* became *r* between vowels in an earlier period of Latin. But it would have been possible to reconstruct the earlier intervocalic **s* with a fair degree of confidence on the basis of the internal evidence alone. Clearly, internal reconstruction depends upon the structural approach to linguistics.

Use of irregular forms for reconstruction

The most recent development in the field of historical and comparative linguistics has come from the theory of generative grammar (see above *Transformational-generative grammar*). If the grammar and phonology of a language are described from a synchronic point of view as an integrated system of rules, then the grammatical and phonological similarities and differences between two closely related languages, or dialects, or between two diachronically distinct states of the same language can be described in terms of the similarities and differences in two descriptive rule systems. One system may contain a rule that the other lacks (or may restrict its application more or less narrowly); one system may differ from the other in that the same set of rules will apply in a different order in the one system from the order in which they apply in the other. Language change may thus be accounted for in terms of changes introduced into the underlying system of phonological and grammatical rules (including the addition, loss, or reordering of rules) during the process of language acquisition. So far these principles have been applied principally to sound change. There has also been a little work done on diachronic syntax.

LANGUAGE CLASSIFICATION

There are two kinds of classification of languages practiced in linguistics: genetic (or genealogical) and typological. The purpose of genetic classification is to group languages into families according to their degree of diachronic relatedness. For example, within the Indo-European family, such subfamilies as Germanic or Celtic are recognized; these subfamilies comprise German, English, Dutch, Swedish, Norwegian, Danish, and others, on the one hand, and Irish, Welsh, Breton, and others, on the other. So far, most of the languages of the world have been grouped only tentatively into families, and many of the classificatory schemes that have been proposed will no doubt be radically revised as further progress is made.

Typological classifications

A typological classification groups languages into types according to their structural characteristics. The most famous typological classification is probably that of isolating, agglutinating, and inflecting (or fusional) languages, which was frequently invoked in the 19th century in support of an evolutionary theory of language development. Roughly speaking, an isolating language is one in which all the words are morphologically unanalyzable (*i.e.*, in which each word is composed of a single morph); Chinese and, even more strikingly, Vietnamese are highly isolating. An agglutinating language (*e.g.*, Turkish) is one in which the word forms can be segmented into morphs, each of which represents a single grammatical category. An inflecting language is one in which there is no one-to-one correspondence between particular word segments and particular grammatical categories. The older Indo-European languages tend to be inflecting in this sense. For example, the Latin suffix *-is* represents the combination of categories "singular" and "genitive" in the word form *hominis* "of the man," but one part of the suffix cannot be assigned to "singular" and another to "genitive," and *-is* is only one of many suffixes that in different classes (or declensions) of words represent the combination of "singular" and "genitive."

There is, in principle, no limit to the variety of ways in which languages can be grouped typologically. One can distinguish languages with a relatively rich phonemic inventory from languages with a relatively poor phonemic inventory, languages with a high ratio of consonants to vowels from languages with a low ratio of consonants to vowels, languages with a fixed word order from languages with a free word order, prefixing languages from suffixing languages, and so on. The problem lies in deciding what significance should be attached to particular typological characteristics. Although there is, not surprisingly, a tendency for genetically related languages to be typologically similar in many ways, typological similarity of itself is no proof of genetic relationship. Nor does it appear true that languages of a particular type will be associated with cultures of a particular type or at a certain stage of development. What has emerged from recent work in typology is that certain logically unconnected features tend to occur together, so that the presence of feature A in a given

language will tend to imply the presence of feature B. The discovery of unexpected implications of this kind calls for an explanation and gives a stimulus to research in many branches of linguistics.

Linguistics and other disciplines

PSYCHOLINGUISTICS

The term psycholinguistics was coined in the 1940s and came into more general use after the publication of Charles E. Osgood and Thomas A. Sebeok's *Psycholinguistics: A Survey of Theory and Research Problems* (1954), which reported the proceedings of a seminar sponsored in the United States by the Social Science Research Council's Committee on Linguistics and Psychology.

The boundary between linguistics (in the narrower sense of the term: see the introduction of this article) and psycholinguistics is difficult, perhaps impossible, to draw. So too is the boundary between psycholinguistics and psychology. What characterizes psycholinguistics as it is practiced today as a more or less distinguishable field of research is its concentration upon a certain set of topics connected with language and its bringing to bear upon them the findings and theoretical principles of both linguistics and psychology. The range of topics that would be generally held to fall within the field of psycholinguistics nowadays is rather narrower, however, than that covered in the survey by Osgood and Sebeok.

Language acquisition by children. One of the topics most central to psycholinguistic research is the acquisition of language by children. The term *acquisition* is preferred to "learning," because "learning" tends to be used by psychologists in a narrowly technical sense, and many psycholinguists believe that no psychological theory of learning, as currently formulated, is capable of accounting for the process whereby children, in a relatively short time, come to achieve a fluent control of their native language. Since the beginning of the 1960s, research on language acquisition has been strongly influenced by Chomsky's theory of generative grammar, and the main problem to which it has addressed itself has been how it is possible for young children to infer the grammatical rules underlying the speech they hear and then to use these rules for the construction of utterances that they have never heard before. It is Chomsky's conviction, shared by a number of psycholinguists, that children are born with a knowledge of the formal principles that determine the grammatical structure of all languages, and that it is this innate knowledge that explains the success and speed of language acquisition. Others have argued that it is not grammatical competence as such that is innate but more general cognitive principles and that the application of these to language utterances in particular situations ultimately yields grammatical competence. Many recent works have stressed that all children go through the same stages of language development regardless of the language they are acquiring. It has also been asserted that the same basic semantic categories and grammatical functions can be found in the earliest speech of children in a number of different languages operating in quite different cultures in various parts of the world.

Theories of language acquisition

Although Chomsky was careful to stress in his earliest writings that generative grammar does not provide a model for the production or reception of language utterances, there has been a good deal of psycholinguistic research directed toward validating the psychological reality of the units and processes postulated by generative grammarians in their descriptions of languages. Experimental work in the early 1960s appeared to show that nonkernel sentences took longer to process than kernel sentences and, even more interestingly, that the processing time increased proportionately with the number of optional transformations involved. More recent work has cast doubt on these findings, and most psycholinguists are now more cautious about using grammars produced by linguists as models of language processing. Nevertheless, generative grammar continues to be a valuable source of psycholinguistic experimentation, and the formal properties of language, discovered or more adequately discussed by generative grammarians than they have been by others, are generally recognized to have important implications for the investigation of short-term and long-term memory and perceptual strategies.

Speech perception. Another important area of psycholinguistic research that has been strongly influenced by recent theoretical advances in linguistics and, more especially, by the development of generative grammar is speech perception. It has long been realized that the identification of speech sounds and of the word forms composed of them depends upon the context in which they occur and upon the hearer's having mastered, usually as a child, the appropriate phonological and grammatical system. Throughout the 1950s, work on speech perception was dominated (as was psycholinguistics in general) by information theory, according to which the occurrence of each sound in a word and each word in an utterance is statistically determined by the preceding sounds and words. Information theory is no longer as generally accepted as it was a few years ago, and more recent research has shown that in speech perception the cues provided by the acoustic input are interpreted, unconsciously and very rapidly, with reference not only to the phonological structure of the language but also to the more abstract levels of grammatical organization.

Information theory and speech perception

Other areas of research. Other areas of psycholinguistics that should be briefly mentioned are the study of aphasia and neurolinguistics. The term aphasia is used to refer to various kinds of language disorders; recent work has sought to relate these, on the one hand, to particular kinds of brain injury and, on the other, to psychological theories of the storage and processing of different kinds of linguistic information. One linguist has put forward the theory that the most basic distinctions in language are those that are acquired first by children and are subsequently most resistant to disruption and loss in aphasia. This, though not disproved, is still regarded as controversial. Two kinds of aphasia are commonly distinguished. In motor aphasia the patient manifests difficulty in the articulation of speech or in writing and may produce utterances with a simplified grammatical structure, but his comprehension is not affected. In sensory aphasia the patient's fluency may be unaffected, but his comprehension will be impaired and his utterances will often be incoherent.

Neurolinguistics should perhaps be regarded as an independent field of research rather than as part of psycholinguistics. In 1864 it was shown that motor aphasia is produced by lesions in the third frontal convolution of the left hemisphere of the brain. Shortly after the connection had been established between motor aphasia and damage to this area (known as Broca's area), the source of sensory aphasia was localized in lesions of the posterior part of the left temporal lobe. More recent work has confirmed these findings. The technique of electrically stimulating the cortex in conscious patients has enabled brain surgeons to induce temporary aphasia and so to identify a "speech area" in the brain. It is no longer generally believed that there are highly specialized "centres" within the speech area, each with its own particular function; but the existence of such a speech area in the dominant hemisphere of the brain (which for most people is the left hemisphere) seems to be well established. The posterior part of this area is involved more in the comprehension of speech and the construction of grammatically and semantically coherent utterances, and the anterior part is concerned with the articulation of speech and with writing. Little is yet known about the operation of the neurological mechanisms underlying the storage and processing of language. (See also the articles entitled PERCEPTION; SPEECH.)

Speech area in the brain

SOCIOLINGUISTICS

Delineation of the field. Just as it is difficult to draw the boundary between linguistics and psycholinguistics and between psychology and psycholinguistics, so it is difficult to distinguish sharply between linguistics and sociolinguistics and between sociolinguistics and sociology. There is the further difficulty that, because the boundary between sociology and anthropology is also unclear, sociolinguistics merges with anthropological linguistics (see below).

It is frequently suggested that there is a conflict between the sociolinguistic and the psycholinguistic approach to the study of language, and it is certainly the case that two distinct points of view are discernible in the literature at the present time. Chomsky has described linguistics as a branch of cognitive psychology, and neither he nor most of his followers have yet shown much interest in the relationship between language and its social and cultural matrix. On the other hand, many modern schools of linguistics that have been very much concerned with the role of language in society would tend to relate linguistics more closely to sociology and anthropology than to any other discipline. It would seem that the opposition between the psycholinguistic and the sociolinguistic viewpoint must ultimately be transcended. The acquisition of language, a topic of central concern to psycholinguists, is in part dependent upon and in part itself determines the process of socialization; and the ability to use one's native language correctly in the numerous socially prescribed situations of daily life is as characteristic a feature of linguistic competence, in the broad sense of this term, as is the ability to produce grammatical utterances. Some of the most recent work in sociolinguistics and psycholinguistics has sought to widen the notion of linguistic competence in this way. So far, however, sociolinguistics and psycholinguistics tend to be regarded as relatively independent areas of research.

Language and socialization

Social dimensions. Language is probably the most important instrument of socialization that exists in all human societies and cultures. It is largely by means of language that one generation passes on to the next its myths, laws, customs, and beliefs, and it is largely by means of language that the child comes to appreciate the structure of the society into which he is born and his own place in that society.

As a social force, language serves both to strengthen the links that bind the members of the same group and to differentiate the members of one group from those of another. In many countries there are social dialects as well as regional dialects, so that it is possible to tell from a person's speech not only where he comes from but what class he belongs to. In some instances social dialects can transcend regional dialects. This is notable in England, where standard English in the so-called Received Pronunciation (RP) can be heard from members of the upper class and upper middle class in all parts of the country. The example of England is but an extreme manifestation of a tendency that is found in all countries: there is less regional variation in the speech of the higher than in that of the lower socioeconomic classes. In Britain and the United States and in most of the other English-speaking countries, people will almost always use the same dialect, regional or social, however formal or informal the situation and regardless of whether their listeners speak the same dialect or not. (Relatively minor adjustments of vocabulary may, however, be made: an Englishman speaking to an American may employ the word "elevator" rather than "lift" and so on.) In many communities throughout the world, it is common for members to speak two or more different dialects and to use one dialect rather than another in particular social situations. This is commonly referred to as code-switching. Code-switching may operate between two distinct languages (*e.g.*, Spanish and English among Puerto Ricans in New York) as well as between two dialects of the same language. The term diglossia (rather than bilingualism) is frequently used by sociolinguists to refer to this by no means uncommon phenomenon.

Variables influencing language usage

In every situation, what one says and how one says it depends upon the nature of that situation, the social role being played at the time, one's status vis-à-vis that of the person addressed, one's attitude towards him, and so on. Language interacts with nonverbal behaviour in social situations and serves to clarify and reinforce the various roles and relationships important in a particular culture. Sociolinguistics is far from having satisfactorily analyzed or even identified all the factors involved in the selection of one language feature rather than another in particular situations. Among those that have been discussed in relation to various languages are: the formality or informality of the situation; power and solidarity relationships between the participants; differences of sex, age, occupation, socioeconomic class, and educational background; and personal or transactional situations. Terms such as style and register (as well as a variety of others) are employed by many linguists to refer to the socially relevant dimensions of phonological, grammatical, and lexical variation within one language. So far there is very little agreement as to the precise application of such terms. (For further treatment of sociolinguistics, see the section *Dialects* in the article LANGUAGE.)

OTHER RELATIONSHIPS

Anthropological linguistics. The fundamental concern of anthropological linguistics is to investigate the relationship between language and culture. To what extent the structure of a particular language is determined by or determines the form and content of the culture with which it is associated remains a controversial question. Vocabulary differences between languages correlate obviously enough with cultural differences, but even here the interdependence of language and culture is not so strong that one can argue from the presence or absence of a corresponding cultural difference. For example, from the fact that English—unlike French, German, Russian, and many other languages—distinguishes lexically between monkeys and apes, one cannot conclude that there is an associated difference in the cultural significance attached to these animals by English-speaking societies. Some of the major grammatical distinctions in certain languages may have originated in culturally important categories (*e.g.*, the distinction between an animate and an inanimate gender). But they seem to endure independently of any continuing cultural significance. The "Whorfian hypothesis" (the thesis that one's thought and even perception are determined by the language one happens to speak), in its strong form at least, is no longer debated as vigorously as it was a few years ago. Anthropologists continue to draw upon linguistics for the assistance it can give them in the analysis of such topics as the structure of kinship. A more recent development, but one that has not so far produced any very substantial results, is the application of notions derived from generative grammar to the analysis of ritual and other kinds of culturally prescribed behaviour.

The "Whorfian hypothesis"

Use of computers in linguistic research

Computational linguistics. By computational linguistics is meant no more than the use of electronic digital computers in linguistic research. At a theoretically trivial level, computers are employed to scan texts and to produce, more rapidly and more reliably than was possible in the past, such valuable aids to linguistic and stylistic research as word lists, frequency counts, and concordances. Theoretically more interesting, though much more difficult, is the automatic grammatical analysis of texts by computer. Considerable progress was made in this area by research groups working on machine translation and information retrieval in the United States, Great Britain, the Soviet Union, France, and a few other countries in the decade between the mid-1950s and the mid-1960s. But much of the original impetus for this work disappeared, for a time at least, in part because of the realization that the theoretical problems involved in machine translation are much more difficult than they were at first thought to be and in part as a consequence of a loss of interest among linguists in the development of discovery procedures. Whether automatic syntactic analysis and fully automatic high-quality machine translation are even feasible in principle remains a controversial question.

Mathematical linguistics. What is commonly referred to as mathematical linguistics comprises two areas of research: the study of the statistical structure of texts and the construction of mathematical models of the phonological and grammatical structure of languages. These two branches of mathematical linguistics, which may be termed statistical and algebraic linguistics, respectively, are typically distinct. Attempts have been made to derive the grammatical rules of languages from the statistical structure of texts written in those languages, but such attempts are generally thought to have been not only unsuccessful so far in practice but also, in principle, doomed to failure. That languages have a statistical structure is a fact well

known to cryptographers. Within linguistics, it is of considerable typological interest to compare languages from a statistical point of view (the ratio of consonants to vowels, of nouns to verbs, and so on). Statistical considerations are also of value in stylistics (see below).

Algebraic linguistics

Algebraic linguistics derives principally from the work of Noam Chomsky in the field of generative grammar (see above *Chomsky's grammar*). In his earliest work Chomsky described three different models of grammar—finite-state grammar, phrase-structure grammar, and transformational grammar—and compared them in terms of their capacity to generate all and only the sentences of natural languages and, in doing so, to reflect in an intuitively satisfying manner the underlying formal principles and processes. Other models have also been investigated, and it has been shown that certain different models are equivalent in generative power to phrase-structure grammars. The problem is to construct a model that has all the formal properties required to handle the processes found to be operative in languages but that prohibits rules that are not required for linguistic description. It is an open question whether such a model, or one that approximates more closely to this ideal than current models do, will be a transformational grammar or a grammar of some radically different character.

Stylistics. The term stylistics is employed in a variety of senses by different linguists. In its widest interpretation it is understood to deal with every kind of synchronic variation in language other than what can be ascribed to differences of regional dialect. At its narrowest interpretation it refers to the linguistic analysis of literary texts. One of the aims of stylistics in this sense is to identify those features of a text that give it its individual stamp and mark it as the work of a particular author. Another is to identify the linguistic features of the text that produce a certain aesthetic response in the reader. The aims of stylistics are the traditional aims of literary criticism. What distinguishes stylistics as a branch of linguistics (for those who regard it as such) is the fact that it draws upon the methodological and theoretical principles of modern linguistics.

Philosophy of language. The analysis of language has always been a subject of particular concern to philosophers, and traditional grammar was strongly influenced by the dominant philosophical attitudes of the day. Modern linguistics and modern philosophical theories have so far had little influence on one another. Some philosophers have shown an interest in Chomsky's controversial suggestion that work in generative grammar lends support to the rationalists in their long-standing dispute about the source of human knowledge. Potentially more fruitful, perhaps, is the interest shown by a number of linguists in philosophical treatments of reference, quantification, and presupposition, in systems of modal logic, and in the work of the so-called philosophers of ordinary language.

Applied linguistics. In the sense in which the term applied linguistics is most commonly used nowadays it is restricted to the application of linguistics to language teaching. Much of the recent expansion of linguistics as a subject of teaching and research in the universities in many countries has come about because of its value, actual and potential, for writing better language textbooks and devising more efficient methods of teaching languages. Linguistics is also widely held to be relevant to the training of teachers of the deaf and speech therapists. Outside the field of education in the narrower sense, applied linguistics (and, more particularly, applied sociolinguistics) has an important part to play in what is called language planning; *i.e.*, in advising governments, especially in recent created states, as to which language or dialect should be made the official language of the country and how it should be standardized. (J.Lyo./Ed.)

Language teaching

Dialectology and linguistic geography

DIALECT GEOGRAPHY

Dialect study as a discipline—dialectology—dates from the first half of the 19th century, when local dialect dictionaries and dialect grammars first appeared in western Europe. Soon thereafter, dialect maps were developed; most often they depicted the division of a language's territory into regional dialects. The 19th-century rise of nationalism, coupled with the Romantic view of dialects and folklore as manifestations of the ethnic soul, furnished a great impetus for dialectology.

19th-century impetus for dialect study

Early dialect studies. The first dialect dictionaries and grammars were most often written by scholars describing the dialect of their birthplace or by fieldworkers whose main method of investigation was free conversation with speakers of the dialect, usually older persons and, preferably, those who showed the least degree of literacy and who had travelled as little as possible. Many of these grammars and dictionaries recorded dialectal traits that deviated from the standard language. In the second half of the 19th century, when historical and comparative linguistic study was flourishing, it became customary to focus attention on the fate of particular elements of the archaic language in a given dialect; *e.g.*, the changes that Latin vowels and consonants underwent when used in different positions in a particular Romance dialect.

With the accumulation of dialectal data, investigators became increasingly conscious of the inadequacy of viewing dialects as internally consistent units that were sharply differentiated from neighbouring dialects. It became more and more clear that each dialectal element or phenomenon refused to stay neatly within the borders of a single dialect area and that each had its own isogloss; consequently, maps of dialects would have to be replaced by maps showing the distribution of each particular feature. While sound scientifically, the preparation and compilation of such maps, called linguistic atlases, is a difficult, costly, voluminous, and time-consuming job.

Dialect atlases. Dialect atlases are compiled on the basis of investigations of the dialects of a large number of places; a questionnaire provides uniform data. There are two basic methods of data collection: fieldwork and survey by correspondence. Fieldwork, in which a trained investigator transcribes dialectal forms directly (or on tape), affords more precise data and enables the questionnaire to include a greater number of diverse questions; but it implies a necessarily limited number of points to be covered. The advantage of the correspondence method lies in its ability to encompass more points at less cost and with less time expended in gathering the data. On the other hand, rural schoolteachers, normally the persons who complete such questionnaires, can answer only a relatively small number of questions and often imperfectly.

The first large-scale enterprise in linguistic geography was the preparation of the German linguistic atlas. In the 1880s, the initiator of this great undertaking, Georg Wenker, composed 40 test sentences that illustrated most of the important ways in which dialects differed and sent them to schoolmasters in over 40,000 places in the German Empire. The sentences were to be translated into the local dialect. Publication of the results was not begun until 1926; the main cause of the delay was the enormous quantity of material to be arranged and analyzed.

The French atlas

The famous French linguistic atlas of Jules Gilliéron and Edmond Edmont was based on a completely different concept. Using a questionnaire of about 2,000 words and phrases that Gilliéron had composed, Edmont surveyed 639 points in the French-speaking area. The atlas, compiled under the direction of Gilliéron, was published in fascicles from 1902 to 1912 and furnished both a strong stimulus and the basic model for work on linguistic atlases elsewhere in the world. European linguists, especially in Romance- and Germanic-speaking countries, were the first to participate in such atlas projects. One of the most significant contributions is the linguistic atlas of Italy and southern Switzerland by Karl Jaberg and Jakob Jud; it appeared from 1928 to 1940. Particularly noteworthy in its attention to precise definitions of meaning, this atlas often used illustrations and described objects and actions of village life denoted by the questionnaire's words.

At present, dialects of virtually all European languages have been treated in linguistic geography studies. In some countries, data are still being collected and classified and maps are being drawn, but in others a second generation

of atlases is already under way. French dialectologists, for instance, are now working on regional atlases that will complement data contained in the *Atlas linguistique de la France*. In England, work began in 1946, under the direction of Harold Orton and Eugene Dieth; the first volume of the *Survey of English Dialects* was published in 1962. In Slavic-speaking countries, work is now under way both on atlases of separate Slavic languages and on the large general Slavic linguistic atlas that will cover nearly 1,000 locales in all parts of European territory where Slavic languages are spoken. Outside Europe, the greatest amount of work in linguistic geography has been completed in Japan and in the United States.

As early as 1905–06, a committee of Japanese dialectologists published the first linguistic atlas of Japan in two volumes, one devoted to phonology and one to morphology. Subsequent work has been done on a new atlas of Japan as a whole and on several regional atlases. The extensive activity of Chinese specialists has concentrated on descriptions of particular local and regional dialects. The Chinese situation is a peculiar one because of the enormous number of people who speak Chinese, the very significant dialectal differentiation (certain dialects, particularly those in the south of China, would be considered by Western standards as separate languages), and the nature of the Chinese script. Chinese characters do not represent sounds but concepts. Because of this, the written language can be read without difficulty in many different dialect areas, although its spoken form varies greatly from one region to another.

Because of the enormous size of the United States, atlas surveys were done by region. Between 1931 and 1933, fieldworkers under the direction of the linguist Hans Kurath surveyed 213 New England communities; the results were published in the *Linguistic Atlas of New England* (with 734 maps) in 1939–43. Based on the methodological experience of Jaberg and Jud in their atlas of Italy and southern Switzerland, this work involved systematic investigations not only among the relatively uneducated but also among better educated, more cultured informants and among the very well educated, cultured, and informed members of a community. Thus the dimension of social stratification of language was introduced into linguistic geography, and valuable material about regional linguistic standards became available.

After 1933, fieldwork was extended to the other Atlantic states. Lack of financial support, however, has hindered the publication of these atlases. Nevertheless, several works based on the material gathered have appeared, among them Kurath's *Word Geography of the Eastern United States*, E. Bagby Atwood's *Survey of Verb Forms in the Eastern United States*, and Kurath's and McDavid's *Pronunciation of English in the Atlantic States*. Independent work was carried out in other U.S. regions, mainly with an adapted form of the questionnaire developed for the Atlantic states; only introductions or summaries of material in the files have been published, however, because of lack of funds.

Works on American English

The most effective and thorough—as well as the most expensive—way of presenting data in linguistic atlases is by printing the actual responses to questionnaire items right on the maps. Phenomena of linguistic geography, however, are usually represented by geometric symbols or figures at the proper points on the map or, even more summarily, by the drawing of isoglosses (linguistic boundaries) or by shading or colouring the areas of particular features.

Only dialect atlases can furnish the complexity of data of the major dialectal phenomena in a multitude of geographic locations in a manner that both assures commensurability of the data and allows a panoramic examination of the whole gamut of data. The inventory of linguistic phenomena is so rich, however, that no one questionnaire can encompass it all. Moreover, the use of a questionnaire unavoidably brings about a schematization of answers that is lacking in spontaneity. For these reasons, other kinds of publications, such as dialect dictionaries or monographs based on extensive free conversation with speakers of local dialects, are indispensable complements to linguistic atlases.

The value and applications of dialectology. The scientific interest of dialectology lies in the fact that dialects are a valuable source of information about popular culture. They reflect not only the history of a language but, to a great extent, the ethnic, cultural, and even political history of a people as well. A knowledge of dialectal facts provides practical guidance to school systems that are trying to teach the standard language to an ever greater number of pupils.

In the 1930s the value of dialectology to the study of language types became apparent. Because dialects greatly outnumber standard languages, they provide a much greater variety of phenomena than languages and thus have become the main source of information about the types of phenomena possible in linguistic systems. Also, in some languages, but not in others, an extremely wide structural variation among dialects has been found. In the Balkan region, where two closely related Slavic languages, Serbo-Croatian and Slovene, are spoken, dialects are found with synthetic declension (case endings, as in Latin) and analytic declension (use of prepositions and word order, as in English). In addition, there are among these dialects complex systems of verbal tenses contrasting with simple ones, as well as dialects with or without the dual number or the neuter gender. The dialects of Serbo-Croatian and Slovene also exhibit almost every type of prosodic structure (*e.g.*, tone, stress, length) found in European languages. Some dialects differentiate long and short vowels or rising and falling accents, while others do not; and in some, but not all, of them stress fulfills a grammatical function. Of the several dozen vowel and diphthong sounds that occur in these dialects, only five are common to all of them; all the rest are restricted to relatively small areas. All of this rich variety contrasts sharply with the relative structural uniformity of the English language—not only in the United States but wherever it is spoken. (The outstanding exceptions are the creolized dialects, which are distinguished by far-reaching structural peculiarities.)

Variations in Serbo-Croatian and Slovene dialects

SOCIAL DIALECTOLOGY

The methodology of generative grammar was first applied to dialectology in the 1960s, when the use of statistical means to measure the similarity or difference between dialects also became increasingly common. The most important development of that time, however, was the rapid growth of methods for investigating the social variation of dialects; social variation, in contrast to geographic variation, is prominent in the United States, above all in large urban centres. In cities such as New York, a whole scale of speech variation can be found to correlate with the social status and educational level of the speakers. In addition, age groups exhibit different patterns, but such patterns of variation differ from one social stratum to another. Still another dimension of variation, especially important in the United States, is connected with the race and ethnic origin of a speaker as well as with the speaker's date of immigration. So-called Black English has been influenced by the southeastern U.S. origin of most of the black population of non-southern U.S. regions; many Black English peculiarities are in reality transplanted southeastern dialectal traits.

Social correlations with speech variation

Normally, speakers of one of the social dialects of a city possess at least some awareness of the other dialects. In this way, speech characteristics also become subjectively integrated into the system of signs indicating social status. And, in seeking to enhance their social status, poorer and less educated speakers may try to acquire the dialect of the socially prestigious. Certain groups—*e.g.*, blacks and the working class—however, will, under certain conditions, show a consciousness of solidarity and a tendency to reject members who imitate either the speech or other types of behaviour of models outside their own social group.

As a consequence of an individual's daily contacts with speakers of the various social dialects of a city, elements of the other dialects are imperceptibly drawn into his dialect. The collective result of such experiences is the spread of linguistic variables—*i.e.*, groups of variants (sounds or grammatical phenomena) primarily determined by social (educational, racial, age, class) influences, an example be-

ing the existence of the two forms "He don't know" and the standard "He doesn't know." Traits representing variables in intergroup relations can become variable features in the speech of individuals as well; *i.e.,* an individual may employ two or more variants for the same feature in his own speech, such as "seeing" and "seein' " or "he don't" and "he doesn't." The frequency of usage for each variable varies with the individual speaker as well as with the social group. There are intermediate stages of frequency between different social groups and entire scales of transitions between different age groups, thus creating even greater variation within the dialect of an individual. The variables also behave differently in the various styles of written or spoken language used by each speaker.

The study of variables is one of the central tasks of any investigation of the dialects of American cities. Applying the statistical methods of modern sociology, linguists have worked out investigative procedures sharply different from those of traditional dialectology. The chief contributor has been William Labov, the pioneer of social dialectology in the U.S. The basic task is to determine the correlation between a group of linguistic variables—such as the different ways of pronouncing a certain vowel—and extralinguistic variables, such as education, social status, age, and race. For a reasonable degree of statistical reliability, one must record a great number of speakers. In general, several examples of the same variable must be elicited from each individual in order to examine the frequency and probability of its usage. Accordingly, the number of linguistic variables that can be examined is quite limited, in comparison with the number of dialectal features normally recorded by traditional fieldworkers in rural communities; in these situations, the investigator is often satisfied with one or two responses for each feature.

Application of modern statistical methods to dialectology

A completely new, flexible, and imaginative method of interviewing is needed for such work in urban centres, as well as new ways of finding and making contact with informants. One example is Labov's method for testing the fate of final and preconsonantal *r* in speakers of different social levels. Choosing three New York City department stores, each oriented to a completely different social stratum, he approached a large number of salesladies, asking each of them about the location of a certain department that he knew to be on the fourth floor. Thus, their answers always contained two words with potential *r*'s—"fourth" and "floor." This shortcut enabled Labov to establish in a relatively short time that the salesladies in the store with richer customers clearly tended to use "*r*-full" forms, whereas those in the stores geared to the poorer social strata more commonly used "*r*-less" forms.

Social dialectology has focused on the subjective evaluation of linguistic features and the degree of an individual's linguistic security, phenomena that have considerable influence on linguistic change. Linguistic scientists, in studying the mechanism of such change, have found that it seems to proceed gradually from one social group to another, always attaining greater frequency among the young. Social dialectology also has great relevance for a society as a whole, in that the data it furnishes will help deal with the extremely complex problems connected with the speech of the socially underprivileged, especially of minority groups. Thus, the recent emphasis on the speech of minority groups, such as the Black English of American cities, is not a chance phenomenon. Specific methods for such investigation are being developed, as well as ways of applying the results of such investigation to educational policies. (P.I./Ed.)

Semantics

Semantics is the philosophical and scientific study of meaning. The term is one of a group of English words formed from the various derivatives of the Greek verb *sēmainō* ("to mean" or "to signify"). The noun semantics and the adjective semantic are derived from *sēmantikos* ("significant"); semiotic (adjective and noun) comes from *sēmeiōtikos* ("pertaining to signs"); semology from *sēma* ("sign") + *logos* ("account"); and semasiology from *sēmasia* ("signification") + *logos* ("account"). It is difficult to formulate a distinct definition for each of these terms because their use largely overlaps in the literature despite individual preferences. Semantics is a relatively new field of study, and its originators, often working independently of one another, felt the need to coin a new name for the new discipline; hence the variety of terms denoting the same subject. The word semantics has ultimately prevailed as a name for the doctrine of meaning, in particular, of linguistic meaning. Semiotic is still used, however, to denote a broader field: the study of sign-using behaviour in general.

MODERN DEVELOPMENT OF SEMANTICS

The concern with meaning, always present for philosophers and linguists, greatly increased in the decades following World War II. The sudden rise of interest in meaning can be attributed to an interaction of several lines of development in various disciplines. From the middle of the 19th century onward, logic, the formal study of reasoning, underwent a period of growth unparalleled since the time of Aristotle. Although the main motivation for a renewed interest in logic was a search for the foundations of mathematics, the chief protagonists of this effort—notably the German mathematician Gottlob Frege and the English philosopher Bertrand Russell—extended their inquiry into the domain of the natural languages, which are the original media of human reasoning. The influence of mathematical thinking, and of mathematical logic in particular, however, left a permanent mark on the subsequent study of semantics.

Semantic theories of the Logical Positivists

Positivist theory. This mark is nowhere more obvious than in the semantic theories offered by the Neopositivists of the Vienna Circle, which flourished in the 1920s and 1930s, and which was composed of philosophers, mathematicians, and scientists who discussed the methodology and epistemology of science. To such "logical" Positivists as the German-born philosopher Rudolf Carnap, for instance, the symbolism of modern logic represented the grammar (syntax) of an "ideal" language. Because the Logical Positivists were, at the same time, radical Empiricists (observationalists) in their philosophy, the semantics of their ideal language has been given in terms of a tie connecting the symbols of this language with observable entities in the world, or the data of one's sense experience, or both. Against such a rigid ideal as logic, natural language appeared to these philosophers as something primitive, vague, inaccurate, and confused. Moreover, since a large part of ordinary and philosophical discourse, particularly that concerning metaphysical and moral issues, could not be captured by the ideal language, the Positivistic approach provided a way to brand all such talk as nonsensical, or at least as "cognitively" meaningless. Accordingly, the Positivists engaged in a prolonged, and largely unsuccessful, effort to formulate a criterion of meaningfulness in terms of empirical verifiability with respect to the sentences formed in natural language.

Whorfian views. Another source of dissatisfaction with the vernacular was made apparent shortly before World War II by the work of the American anthropological linguist Benjamin Lee Whorf. Whorf's famous thesis of linguistic relativity implied that the particular language a person learns and uses determines the framework of his perception and thought. If that language is vague and inaccurate, as the Positivists suggested, or is burdened with the prejudices and superstitions of an ignorant past, as some cultural anthropologists averred, then it is bound to render the user's thinking—and his mental life itself—confused, prejudiced, and superstitious. The Polish-American semanticist Alfred Korzybski, the founder of the movement called General Semantics, believed that the cure for such vague and superstition-laden language lay in a radical revision of linguistic habits in the light of modern science.

School of natural language. Natural language did not remain without champions in the face of this combined onslaught from the logicians and the Whorfians. A reaction started in England, first in Cambridge, then in Oxford. Influenced by the English philosopher George Edward Moore but more so by the "converted" Vienna-born Positivist Ludwig Wittgenstein, the philosophy of "ordinary

language" (also known as the Oxford school) came into its own in the 1940s. According to the philosophers of this group, natural language, far from being the crude instrument the Positivists alleged it to be, provides the basic and unavoidable matrix of all thought, including philosophical reflections. Any "ideal" language, therefore, can make sense only as a parasitical extension of, and never as a substitute for, the natural language. Philosophical problems arise as a result of a failure to see the workings of man's language; they are bound to "dissolve" with improved understanding. These assumptions provided a mighty impetus to reflect upon the vernacular language, including its minute points of grammar and fine nuances of meaning. Indeed, some of the later representatives of this approach, particularly the English philosopher John L. Austin, became renowned as much among linguists as among philosophers.

Modern grammatical influences. In the 1950s the science of linguistics itself rose to the challenges that had been coming chiefly from philosophical quarters. The development of transformational, or generative, grammar, initiated by the work of the U.S. linguists Zellig S. Harris and Noam Chomsky, opened a deeper insight into the syntax of the natural languages. Instead of merely providing a structural description (parsing) of sentences, this approach demonstrates how sentences are built up, step by step, from some basic ingredients. In the hands of the philosopher, this powerful new grammar not only served to counter the positivistic charge of imprecision laid against natural language but aided him in his own work of conceptual clarification. Moreover, the generative approach promised further results: since the late 1960s some steps have been taken to develop a generative semantics for natural languages, in addition to a generative syntax.

Influence of transformational grammar

PHILOSOPHICAL VIEWS ON MEANING

Meaning and reference. On a rather unsophisticated level the problem of meaning can be approached through the following steps. The perception of certain physical entities (objects, marks, sounds, and so on) might lead an intelligent being to the thought of another thing with some regularity. For example, the sight of smoke evokes the idea of fire, footprints on the sand makes one think of the man who must have passed by. The smoke and the footprints are thus signs of something else. They are natural signs, inasmuch as the connection between the sign and the thing signified is a causal link, established by nature and learned from experience. These can be compared with road signs, for example, or such symbols as the outline of a heart pierced by an arrow. The connection between the symbol and the thing signified in these cases is not a natural one; it is established by human tradition or convention and is learned from these sources. These nonnatural signs, or symbols, are widely used in human communication.

In this framework the elements of language appear to be nonnatural signs. The interest in words and phrases reaches beyond their physical appearance; their perception is likely to direct attention or thought to something else. Words, in fact, are the chief media of human communication, and, as the diversity of languages clearly shows, the link involved between words and what they signify cannot be a natural one. Words and sentences are like symbols: they point beyond themselves; they mean something. Smoke means fire, the pierced heart means love. Words mean the thing they make us think of; the meaning of the word is the tie that connects it with that thing.

Words as symbols

There are some words for which this approach seems to work very straightforwardly. The name Paris means (signifies, stands for, refers to, denotes) the city of Paris, the name Aristotle means that philosopher, and so forth. The initial plausibility of such examples created an obsession in the minds of many thinkers, beginning with Plato. Regarding proper names as words par excellence, they tried to extend the referential model of meaning to all of the other classes of words and phrases. Plato's theory of "forms" may be viewed as an attempt to find a referent for such common nouns as "dog" or for abstract nouns like "whiteness" or "justice." As the word Socrates in the sentence "Socrates is wise" refers to Socrates, for example, so the word wise refers to the form of wisdom. Unfortunately, whereas Socrates was a real person in this world, the form of wisdom is not something to be encountered anywhere, at any time, in the world. The difficulty represented by "Platonic" entities of this kind increases as one tries to find appropriate referents for verbs, prepositions, connectives, and so forth. Discussion of abstract entities such as classes (*e.g.*, the class of all running things) and relations (*e.g.*, the relation of being greater than . . .) abound in philosophical literature; Gottlob Frege even postulated "the True" and "the False" as referents for complete propositions.

There are many more serious problems besetting the referential theory of meaning. The first one, eloquently pointed out by Frege, is that two expressions may have the same referent without having the same meaning. For example, "the Morning Star" and "the Evening Star" denote the same planet, yet, clearly, the two phrases do not have the same meaning. If they had, then the identity of the Morning Star and the Evening Star would be as obvious to anybody who understands these phrases as the identity of a vixen with a female fox or a bachelor with an unmarried man is obvious to speakers of English. As it is, the identity of the Morning Star with the Evening Star is a scientific and not a linguistic matter. Thus, even in the case of names, or expressions equivalent to names, one has to distinguish between the denotation (reference, extension) of the name—*i.e.*, the object (or group of objects) it refers to—and its connotation (sense, intension)—*i.e.*, its meaning.

Denotation and connotation

The second problem with the theory of referential meaning arises from phrases that, though meaningful, pretend to refer but, in fact, do not. For example, in the case of such a definite description as "the present king of France," the phrase is meaningful although there is no such person. If the phrase were not meaningful, one would not even know that the phrase has no actual referent. Russell's analysis of these phrases, and the U.S. philosopher Willard V. Quine's similar treatment of such names as Cerberus, effectively detached meaning from reference by claiming that these expressions, when used in sentences, are equivalent to a set of existential propositions; *i.e.*, propositions without definite reference. For example, "The present king of France is bald" comes out as "There is at least, and at most, one person that rules over France, and whoever rules over France is bald." These propositions are meaningful, true or false, without definite reference.

Names, in fact, are very untypical words. The name of the third Secretary General of the United Nations, U Thant, has no meaning in English. Whether it means anything in Burmese does not matter either; the reference is not affected by the meaning or the lack of meaning of the name. Names, as such, do not belong to the vocabulary of a language; most dictionaries do not list them. Thus, in spite of the initial plausibility, the idea of reference does not help in understanding the nature of linguistic meaning.

Meaning and truth. Despite the failure of referential meaning, many philosophers were quite unwilling to give up the idea that the meaning of linguistic expressions has something to do with objects, events, and states of affairs in the world. They reasoned that if language is used to talk about the physical environment, then there must be some connection between man's words and the things around him. If reference fails to provide the link, something else must.

In the face of referential failure Russell fell back on truth. The Positivists suggested verifiability as the criterion of empirical meaning. Indeed, at least in many cases, it stands to reason that to understand a sentence is to know what state of affairs would make it true or false. Such considerations motivate the aletheic (Greek *alētheia*, "truth") semantic theories, which claim that the notion of meaning is best explained in terms of truth rather than reference.

The most influential discussion of the notion of truth was offered by the Polish-born mathematician and logician Alfred Tarski in the 1930s. His semantic definition of truth is contained in the following formula (which he called [T]):

Tarski's semantic definition of truth

(T) X is true if, and only if, p

in which "p" is a variable representing any sentence and "X" is a variable representing the name, or unique de-

scription, of that sentence. The easiest way to obtain such a unique description is to put the sentence in quotation marks. Thus, we get such instances of (T) as

"Snow is white" is true if, and only if, snow is white.

The above formula implies a distinction between the object language and the metalanguage. "*X*" represents the name of a sentence in the object language—*i.e.,* roughly, the language used to talk about things in the world. The instances of (T) themselves, however, are in the metalanguage, the language in which one can talk about both things in the world and sentences of the object language. Tarski claimed that no language can contain its own truth predicate, for if it did then it would permit the formation of such sentences as:

(S) This very sentence is false.

Is the sentence (S) true or false? Clearly, it is true if, and only if, it is false, which is an intolerable paradox. Consequently, for any language the predicate ". . . is true" and other semantical predicates must belong to a language of a higher order (a metalanguage).

For this reason Tarski restricted his theory to clearly formalized, artificial languages, a decision that was very much in line with the positivistic tendencies of the 1930s. Nevertheless, the Tarski formula remained attractive even to some semanticists concerned with meaning in natural languages. For one thing, it seemed to succeed in pairing linguistic entities (named by the values of "*X*"; *e.g.,* the sentence "Snow is white") and nonlinguistic entities (named by the values of "*p*"; *e.g.,* the fact, or possible state of affairs, that snow is white). This correlation, however, is not very helpful because each one of the nearly infinite number of sentences one may form would have its "fact" as a counterpart, identifiable only by means of that very same sentence. Consequently, if linguistic meaning consisted in these correlations, no one could learn the meaning of any sentence at all and certainly not the meaning of all the sentences the speakers of a language are able to understand.

What was needed was a theory explaining the contribution of individual words—a clearly finite set—to the truth of sentences. Tarski himself, as well as other writers, suggested a repeatable procedure based on the notion of satisfaction. Snow, for example, satisfies the sentential function "*x* is white" because "Snow is white" is true. In much the same way, 3 satisfies the function "$2 \cdot x = 6$" because "$2 \cdot 3 = 6$" is true. Simply stated, the meaning of the predicate ". . . is white" is determined—and is learned—in terms of the set of objects of which it is true.

Limitations to the "meaning as truth" theory

As this approach is extended to cover the wide variety of words that exist in a natural language, however, its initial simplicity—and thereby its attractiveness—becomes progressively lost. This can be illustrated by "egocentric" words like "I," "you," "here," and "now"; by connectives like "since," "however," and "nevertheless"; and, if these appear trivial, by such crucial words as "believe," "know," and "intend," on the one hand, and "good" and "beautiful" on the other. Whereas it is plausible to say that, for instance, Joe and Mary satisfy the function "*X* loves *Y*," provided Joe loves Mary, it is more complicated to determine what would satisfy such functions as "*X* believes *Y*," "*X* knows *Y*," or "*X* intends *Y*." "*X*" is satisfiable by people, but the satisfaction of "*Y*" poses a problem. If one suggests such things as propositions, facts, and possibilities, one is confronted with abstract entities of a kind similar to those encountered in the Platonic theory of referential meaning. Again, can it be said that John and a unicorn will satisfy the function "*X* looks for *Y*"—if it is true that John looks for a unicorn?

Another difficulty arises concerning "good," "beautiful," and other words of moral or aesthetic judgment. If, for example, beauty is indeed "in the eye of the beholder," then what one person calls beautiful might not similarly impress another, yet two people might keep arguing as to whether the thing is beautiful or is not. Thus, people may seem to agree on the meaning of the word, yet remain at odds about its proper application. The meaning of such "emotive" words cannot be decided in terms of truth alone.

A more serious objection to the aletheic (truth) theory arises from the fact that many significant utterances of natural language are not true or false at all. Whereas statements, testimonies, and reports are true or false, orders, promises, laws, regulations, proposals, prayers, curses, and so forth are not assessed in terms of truth or falsity. It is not obvious that the employment of words in these speech acts is less relevant to their meaning than their use in speech acts of the truth-bearing kind.

Meaning and use. The difficulties just mentioned lead to another view concerning the notion of meaning, a theory that may be called the use theory. This view admits that not all words refer to something, and not all utterances are true or false. What is common to all words and all sentences, without exception, is that people use them in speech. Consequently, their meaning may be nothing more than the restrictions, rules, and regularities that govern their employment.

The use theory has several sources. First, in trying to understand the nature of moral and aesthetic discourse certain authors suggested that such words as "good" and "beautiful" have an emotive meaning instead of (or in addition to) the descriptive meaning other words have; in using them one expresses approval or commendation. If one says, for instance, that helping the poor is good, one does not describe that action, but says, in effect, something like "I approve of helping the poor, do so as well." Such is the role of these words, according to these thinkers, and to understand this role is to know their meaning.

Wittgenstein's language games

The second, and more important, stimulus for the use theory was provided by the work of Ludwig Wittgenstein. This philosopher not only pointed out the wide variety of linguistic moves mentioned above but in order to show that none of these moves enjoys a privileged status proposed the idea of certain language games in which one or another of these moves plays a dominant or even an exclusive role. One can imagine, for instance, a tribe whose language consists of requests only. Members of the tribe make requests and the other members comply or refuse. There is no truth in this language, yet the words used to make requests would have meaning. Human language as it exists in reality is more complex; it is a combination of a great many language games. Yet the principle of meaning, according to this theory, is the same: the meaning of a word is the function of its employment in these games. To Wittgenstein the question "What is a word really?" is analogous to "What is a piece in chess?"

Finally, John L. Austin offered a systematic classification of the variety of speech acts. According to him, to say something is to do something, and what one does in saying something is typically indicated by a particular performative verb prefixing the "normal form" of the utterance. These verbs, such as "state," "declare," "judge," "order," "request," "promise," "warn," "apologize," "call," and so on, mark the illocutionary force of the utterance in question. If one says, for instance, "I shall be there," then, depending on the circumstances, this utterance may amount to a prediction, a promise, or a warning. Similarly, the words of the commanding officer, "You will retreat" may have the force of a simple forecast, or of an order. If the circumstances are not clear, the speaker always can be more explicit and use the normal form; *e.g.,* "I promise that I shall be there" or "I order you to retreat."

To rephrase the conclusion already stated: the dimension of truth and falsity is not invoked by all the utterances of the language; therefore, it cannot provide an exclusive source of meaning. There are other dimensions, such as feasibility (in case of orders and promises), utility (in case of regulations and prescriptions), and moral worth (in case of advices and laws). These dimensions may be as much involved in the understanding of what one said and, consequently, in the meaning of the words the speaker used, as the dimension of truth.

As previously mentioned, philosophers professing the aletheic theory claimed that the meaning of a word should be explained in terms of its contribution to the truth or falsity of the sentences in which it can occur. The latest form of the use theory is an appropriate extension of the same idea. According to some exponents, the meaning of

a word is nothing but its illocutionary act potential—*i.e.*, its contribution to the nature of the speech acts that can be performed by using that word. One difficulty with this view is that the definition is too broad, to the extent of being unilluminating or useless. Given this definition, nobody would know what any word means without knowing the entire language completely because the possibilities of employing a given word are not only without limit but extend to every conceivable context and circumstance. As Wittgenstein stated so forcefully,

Difficulties with the use theory

> The sign (the sentence) gets its significance from the system of signs, from the language to which it belongs. Roughly: understanding a sentence means understanding a language.

If this be the case, how can one account for the obviously gradual and prolonged process of learning a language? Indeed, the definition of the meaning of a word as illocutionary act potential seems to overstate the case. The obvious truth that the meaning of performative verbs, and other words closely tied to one illocutionary aspect or other, cannot be divorced from the nature of that type of speech act, does not entail that the meaning of an ordinary word, like "cat" or "running" is affected by any illocutionary force. Such words can occur in utterances bearing all kinds of illocutionary forces, so the contribution of these forces, as it were, cancel out. Nevertheless, what remains is the fact that all words are used to say something, in one way or another. The use theory would put a strong emphasis on the word "used" in the previous sentence. The next, and final, approach to meaning would stress the word "say."

Meaning and thought. In Wittgenstein's chess example, moves are made by moving the pieces. In a language, moves (saying something) are made by using words. And, according to the use theory, as a piece is defined by its move potential, so (the meaning of) a word is defined by its "saying" potential.

This analogy works only up to a certain limit. Whereas chess is only a game, the use of language is much more. One plays chess—or any other game—for its own sake; one speaks, however, with other ends in mind. Games, as it were, do not point beyond themselves; speech does. In order to see this, compare an ordinary conversation with such word games as children play—*e.g.*, exchanging words that rhyme, or words that begin with the same letter. These word games are language games and nothing more because the children use words according to certain rules. In doing so, however, they do not say anything except in the trivial sense of uttering words; nor are they called to understand what the other children say beyond the minimal feat of recognizing the words.

In real speech the situation is radically different. The point of using words in a real speech act is to be understood. If someone says, "It will rain tomorrow," his aim is to make the hearer believe that it will rain tomorrow. It is possible, of course, that the hearer or listener will not believe the speaker. Nevertheless, if the hearer understands what the speaker says, he will at least know that this is what the other person wants him to believe by saying what he says. Similarly, if one says, "Go home," and the listener understands what is said, then, whether or not the listener will actually go, he will at least know that this is what the speaker wants to bring about by using these words. Thus, the notion of saying something is inseparably tied to such concepts as belief, intention, knowledge, and understanding.

Speech as an expression of thought

The view just outlined is a reformulation of a very traditional idea, namely, that speech is essentially the expression of thought. Words are used not to play a game with fixed rules but to express beliefs and judgments, intentions and desires; that is, to make others know, by the use of words according to fixed rules, that one has certain beliefs, desires, and so forth, and that one invites others to share them.

"Expression of thought" sounds rather vague. For one thing, what is a thought? Suppose John believes that Joe has stolen his watch. John can express this belief by saying, "Joe has stolen my watch" or "My watch has been stolen by Joe" or "It is Joe who has stolen my watch" and so on. Moreover, if John is a multilingual person, he can express the same belief in German, French, and so forth. These variants, called paraphrases and translations respectively, will express the same belief, the same thought. But whereas it makes sense to ask for the exact words of John's statement or to ask about the language in which it was made, it would be foolish to ask for the exact words of John's belief or to ask about the language in which it is framed. The alternative in "Do you believe that Joe has stolen the watch, or that the watch was stolen by Joe?" does not make sense. Consequently, the same thought—the same proposition, as some philosophers prefer to call it—can be expressed by using various linguistic media. In other words, the same thought can be encoded in various codes (languages) and in various ways in the same code (paraphrases) in much the same way as the same idea can be expressed in speech or in writing and the same numbers can be written by using Roman or Arabic numerals.

From this point of view, it appears that saying something involves encoding a thought and that understanding what one said involves decoding and recovering the same thought. The meaning of a sentence will consist in its relation to the thought it is used to encode. This may be viewed as the fundamental thesis of the psychological theory of meaning.

As previously explained, no theory of meaning can be adequate as long as it treats sentences as indivisible units. For, in the first place, the potentially infinite number of sentences would defy any attempt to learn their meaning one by one, and, second, such a theory could not account for the obvious ability of fluent speakers to understand entirely novel sentences. There must be, therefore, a correlation between certain recurring elements of sentences (roughly, words) and certain recurring elements of thoughts (roughly, concepts or ideas). Accordingly, the learning of the semantic component of a language will consist in the learning of these connections.

In this learning process two notions play a prominent role: synonymy and analyticity. As the sentences that express the same thought stand in the relation of paraphrase (or translation), so words or phrases that code the same idea are related as synonyms—*e.g.*, "vixen" and "female fox." Again, because one concept may include another, the sentence expressing this relation will record a conceptual truth or analytic proposition; *e.g.*, "A dog is an animal." A definition, finally, will exhibit all parts of a concept by a combination of such propositions.

Synonyms and analytic propositions

What concepts are and how they are related to words are topics that have been discussed throughout the history of philosophy. The following problems related to concepts pertain to the core of philosophical psychology: whether all concepts are derived from experience, as Aristotle and the Empiricists believed, or whether some of them at least are innate, as Plato and the Rationalists maintained; whether concepts exist prior to and independent from their verbal encodings, as the Realists and Conceptualists claimed, or whether they are nothing but a certain "field of force" accompanying the words, as the Nominalists thought.

It should be noted that these disputes, in a modern garb, still continue with undiminished force. Contemporary Empiricists still try to reduce most concepts to a configuration of sense data, or a pattern of nerve stimulation, while the Behaviourists attempt to explain understanding in terms of overt behaviour. Modern-day Rationalists reply by insisting on the unique spontaneity of human speech and by reviving the theory of innate ideas.

MEANING IN LINGUISTICS

Semantics in the theory of language. The science of linguistics is concerned with the theory of language expressed in terms of linguistic universals—*i.e.*, features that are common to all natural languages. According to the widely adopted schema of the U.S. scholar Charles W. Morris, this theory must embrace three domains: pragmatics, the study of the language user as such; semantics, the study of the elements of a language from the point of view of meaning; and syntax, the study of the formal interrelations that exist between the elements of a language (*i.e.*, sounds, words) themselves. Subsequently, certain authors spoke of three levels: the phonetic, the syntactic (the pho-

Pragmatics, semantics, and syntax

netic and syntactic together are often called grammatical), and the semantic level. On each of these levels a language may be studied in isolation or in comparison with other languages. In another dimension, the investigation might be restricted to the state of a language (or languages) at a given time (synchronic study), or it might be concerned with the development of a language (or languages) through a period of time (diachronic study).

Semantics, then, is one of the main fields of linguistic science. Yet, except for borderline investigations, the linguist's interest in semantic matters is quite distinct from the philosopher's concern. Whereas the philosopher asks the question "What is meaning?", the typical questions the linguist is likely to ask include: "How is the meaning of words encoded in a language?" "How is this meaning to be determined?" "What are the laws governing change of meaning?" and "How can the meaning of a word be given, expressed, or defined?"

A few examples will suffice to illustrate some of these problems, and to show how the linguist's approach differs from that of the philosopher. In the matter of encoding, words are arbitrary signs; to some authors, particularly to the Swiss linguist Ferdinand de Saussure, this feature of arbitrariness represents an essential characteristic of all real languages. Nevertheless, in all languages there are clear cases of onomatopoeia—*i.e.*, the occurrence of imitative words, such as "whisper," "snore," "slap," and, more remotely, "cuckoo."

There are several other issues that pertain to the question of encoding. Certain languages show a marked preference for very specific words, at least in certain domains, while lacking the corresponding general terms, which are the only ones occurring in other languages. The Eskimos, for instance, have a number of words denoting various kinds of snow, but no single word for snow. Similarly, in English, although there are distinct names for hundreds of animal species, there is no name for the very familiar animal species of which the female member is called cow and the male member bull.

There are also languages, such as English or Chinese, that for the most part prefer single words to the compounded phrases that other languages (*e.g.*, German) seem to favour. Accordingly, whereas the English vocabulary is larger, the German words are more pliable, capable of entering into compounds often of great length and complexity. Such differences support Saussure's distinction between lexicological and grammatical languages.

Context-bound and context-free words

Another distinction can be drawn concerning the relative frequency and importance of context-bound and context-free words. The meaning of such English words as "take," "put," and "get" depends almost entirely on the context—*e.g.*, putting up with somebody has very little to do with putting off something or other. These can be compared with verbs like "canter" or "promulgate," which, by their very specific meaning, almost determine the context, rather than having their meaning determined by the context. Clearly, the context-bound type of word, such as "take" or "put," lends itself to idiomatic use, rather than the context-free word.

There are some obvious regularities in the change of meaning that are of interest to the linguist. One such regularity is the extension or transference of meaning based upon some similarities—*i.e.*, the phenomenon of metaphor. For example, one can speak of the leg of the table, the mouth of the river, the eye of the needle, and the crown of the tree. These are anthropomorphic metaphors: the transfer goes from something belonging to an individual or close to him (his body, garments) to something more remote. The same principle operates in the extension of meaning from a domain close in interest rather than in physical proximity. Baseball-minded people are apt to speak of "not getting to first base," "striking out," or "scoring a hit" in contexts often remote from baseball. For a similar reason, many abstract concepts are denoted by words transplanted from the concrete domain. Such phrases as "grasping ideas," "seeing the point of a joke," "body of knowledge," "in the back of my mind," and many others, are the result of this very important move from the abstract to the concrete.

Meaning changes of another type are the result of emotive factors. The word democracy, for instance, has all but lost its original meaning and has become a word applicable to any system the speaker wants to praise. The contrary development is exhibited in the recent history of such words as "Fascist" and "aggression." In order to avoid derogatory connotations one is often forced, by social pressure, to use euphemisms, often to the detriment of clarity. Examples of this include the switch from "underdeveloped nations" to "developing nations," from "retarded children" to "exceptional children," and from "old people" to "senior citizens."

The preceding are but a few examples concerning coding and meaning change. The questions about the ways of finding out what a word means and about the manner of giving an adequate definition of a word deserve a more detailed account.

Meaning, structure, and context. Foreigners in a strange country and linguists are often confronted with the task of learning a new language. It is important to realize that in doing so they do not set out with a completely blank mind: they expect to learn a language (*i.e.*, a system of communication describable in terms of a large set of linguistic universals). They expect—consciously in the case of the linguist and unconsciously in the case of the layman—to find words and sentences, grammatical structures, and illocutionary forces in that language. And, on the semantic level, they expect words that will fit into the familiar semantic classes. They are confident, in other words, that the language they intend to master will be intertranslatable with their own.

Structure and language learning

Therefore, although at the very beginning their learning remains on the ostensive level (trying to find out the name of this or that kind of object), very soon they proceed to the level of first guessing, then establishing, the meaning of words from the contexts in which they occur. This has to be the case, for words that in any way can be viewed as "names" of objects (*i.e.*, that could be learned ostensively) form but a fraction of the vocabulary of any language. Anyone who doubts this should but try to list the words from this paragraph that could be learned ostensively. Moreover, linguists find no great difficulties in learning dead languages—*e.g.*, that of the ancient Egyptians—without any contact with any speaker, provided that a sufficiently large corpus of texts is available and that some clues are provided to the meaning of at least some words.

If any more evidence concerning this point is needed, one should remember that "pictorial" dictionaries are bound to remain on the kindergarten level, and that the mark of a good dictionary is the abundance of appropriate contexts. Thus, the contexts show the concept.

These intuitions are behind the U.S. philosopher Paul Ziff's semantic theory. According to Ziff, the meaning of a word is a function, first, of its complementary set, which consists of all the acceptable sentences in which the word can occur, and, second, of its contrastive set, which consists of all of the words that can replace that word in all of these sentences without rendering the sentences deviant. Clearly, the elaboration of the contrastive set will produce words more and more similar in meaning to the word in question, the limiting case being synonyms that can occur wherever the word in question can occur.

This theory is in need of further refinement. In the sentence "The cat sleeps," the fact that "cat" can co-occur with "sleep" undoubtedly casts some light on the meaning of these words (a cat is a kind of thing that can sleep). But there are a great number of sequences that could complete the frames "The cat sleeps and . . . ," ". . . said that the cat sleeps," and so forth. Clearly, the near infinity of the resulting sentences will not contribute anything to the meaning of "cat" beyond what the segment "the cat sleeps" already contributes.

Surface forms and underlying structures

Transformational grammar can be of assistance at this point. According to this approach, the sentences just considered are simply surface forms, each corresponding to an underlying structure, in which "cat" and "sleep" appear as forming an elementary, or kernel sentence (roughly: "a cat sleeps"). The essence of Ziff's insight can be rein-

terpreted in terms of the notions developed by Zellig S. Harris: co-occurrence (instead of complementary set) and co-occurrence difference (instead of contrastive set), both restricted to kernels. Because the vocabulary of a language is limited and the number of kernel structures is very small, the meaning of a word can be determined on the basis of a finite set of elementary sentences.

The contribution of grammar to semantic theory is by no means exhausted by this step. For the grammatical restrictions on a word represent, as it were, the "skeleton" of its meaning before the "flesh" is put on by the co-occurrences. The very first step in giving the meaning of a word is to specify its grammatical category—noun, verb, adjective, adverb, connective, and so forth—and not to speak of grammatical constants (such as the first, but not the second, "to" in "I want to go to Paris"), the meaning of which, if any, is entirely determined by their grammatical role. A refined grammar yields much more: the fact that the adjective "good," for example, unlike adjectives like "yellow" or "fat," can occur in the frames "(He is) good at (playing chess)"; "(The root is) good to (eat)"; "It is good that (it is raining)"; "It was good of (him) to (come)" says a great deal about the meaning of that word. The co-occurrences then complete the picture.

Lexical entries. Good dictionaries offer a variety of contexts for the items listed, but, obviously, this is not enough. For one thing, no dictionary can list all the co-occurrences. There must be devices to sum up, as it were, the information revealed by the contexts. This is the role of dictionary definitions. The branch of scientific semantics that is concerned with the form and adequacy conditions of dictionary entries is called lexicography.

A systematic study of dictionary entries was presented in the 1960s by the U.S. philosophers Jerrold J. Katz and Jerry A. Fodor. According to them, the standard form of a dictionary entry comprises three kinds of ingredients: grammatical markers, semantic markers, and distinguishers. The grammatical markers describe the syntactic behaviour of the item in question in terms of a refined system of grammatical categories. The traditional division of words into nouns, adjectives, verbs, adverbs, and so on is but the first step in this direction. The class of nouns, for example, has to be subdivided into count nouns (like "cat"), mass nouns (like "water"), abstract nouns (like "love"), and so forth. The class of adjectives must be classified into subclasses that are fine enough to capture the grammatical peculiarities of such adjectives as "unlikely" or "good." The traditional subdivision of verbs into transitives and intransitives has to be completed to account for such verbs as "compare" or "order," which obviously involve three noun phrases ("someone compares something to something"), often of a particular kind ("human" nouns or noun clauses).

The idea of a semantic marker is merely a further elaboration of the traditional notions of genus and species. The result is a system of semantic markers that comprise such items as "physical object," "animate," "human," "male," "young" (in the case of the entry for "boy"), and others. Katz claims that the problems of synonymy, analyticity, and contradiction can be handled, at least in part, in terms of lexical items sharing some or all of their semantic markers.

Finally, the distinguisher completes the dictionary entry by giving, as it were, the leftover, if any, of the semantic information. There is no general form for the distinguisher; it may give the atomic weight (for elements), purpose (for tools), concise description (for animals), and so forth.

Generative semantics. According to the original formulation of generative or transformational grammar, the semantic and the syntactic components were regarded as distinct elements in the deep structure of a sentence. The syntactic component consisted of a relation of phrase markers giving the transformational structure of the sentence, usually represented in terms of "tree" diagrams with such nodes as "S" for sentence, "NP" for noun phrase. The semantic content entered through the process of lexical insertion—*i.e.*, the replacement of some of the nodes by words, the carriers of meaning. Lexical insertion was supposed to take place at the very beginning of the series of transformations leading up to the surface form of the sentence. The original input of meaning, as it were, was carried through the transformations yielding the semantical reading, or sense, of the whole sentence.

Lexical insertion in a generative grammar

Several modern studies have attempted to demonstrate that this separation between syntax and semantics cannot be maintained. It appears that certain words in themselves indicate a structure analogous to syntactic structures. For example, consider "harden" and "break." To harden something is to cause that thing to become hard (or harder); to break something is to cause something to become broken. Because "harden" consists of two elements, "hard-" and "-en," thus it could be argued that the word itself is structured; "break" does not indicate any structure, yet its meaning clearly involves one. "Broken," therefore, carries a more basic semantic unit than "break." Again, in the case of such verbs as "remind," "allege," "blame," or "forgive," one feels that their meaning is highly structured, and, with some thinking, one can articulate the presuppositions of these words, which involve a great number of semantic units in a very complex relationship.

These and similar reasons support the theory of generative semantics, which denies a clear distinction between the semantic and the syntactic components. The transformations, in this theory, connect the surface structure of the sentence with its semantic representation (or according to some linguists, its logical form). Words, then, can encode either a semantic primitive (such as "blue") or a whole structure (such as "forgive") within the semantic representation. Thus, there is no definite point in the transformational history of the sentence at which lexical insertion must occur. The ultimate conclusion of this view is that, instead of the threefold division of semantics, syntax, and phonetics, all that is needed is the simple distinction between semantics and phonetics, corresponding to the distinction between meaning (as structured) and its verbal encoding. How much, finally, of the semantic structure can be attributed to a particular language, and how much can be ascribed to common (and possibly innate) elements of the human mind, remains a fascinating problem for continued study. (Z.V.)

The study of writing

This section deals with the various fields of study relating to written sources and writing systems. Of these, the most important are philology, which deals mainly with written and oral source materials; and linguistics and grammatology, which deal mainly with systems of signs, which in turn are based on primary source materials. The use of the word "mainly" implies that, while certain fields deal predominantly with certain aspects of study, there are no sharp divisions between them, and some areas of study can be treated by both disciplines.

THE SCOPE OF THE STUDY OF WRITING

Sources of information. In a study of any system of writing, a basic distinction must be made between the raw materials (subject matter) that are studied and the systems deduced from them. Spoken (or written) utterances represent the raw materials of a language; a grammar or a lexicon presents a linguistic system abstracted and reconstructed from these materials. Similarly, written texts represent the raw materials of writing from which an alphabet can be reconstructed.

Written sources

Manifold sources of information bear on systems of writing: (1) Written sources proper include texts, inscriptions, books, and manuscripts. The ability to understand these sources can be handed down traditionally from generation to generation, as in the case of the Hebrew or Chinese writings, or it must be recovered by a process of decipherment, as in the case of the Egyptian hieroglyphic. (2) Lists of signs, alphabets, syllabaries, and so on can be devised by the "inventors" of a writing at the time when the writing is first introduced; or they can be reconstructed in later times from the written sources by teachers or scholars for didactic or scholarly purposes. (3) Studies are based on

written sources or lists of signs, alphabets, syllabaries, and so on. Such studies can be primary, when they are based directly on sources, or secondary, when they must rely on primary studies for information.

A partial study, which is delimited by the subject matter, times, and area, must be distinguished from a general, comprehensive study of the subject. Thus an analysis of the writing of Middle English, Egyptian hieroglyphic writing, or the Greek alphabet may be contrasted with an analysis of the structure of alphabetic writings or a study of cursive or monumental writing.

Definitions of terms. *Semiotics.* As has been noted above, men communicate with each other by means of various systems of signs, of which the most universal are language, a system of auditory communication; and gesture language and writing, two systems of visual communication. For the general science of signs, several terms have been proposed, of which the term semiotic, or semiotics, as here preferred, may perhaps be the most appropriate. Semiotics covers a much broader area than the term semantics, which deals with the meaning of linguistic elements.

Philology, linguistics, and grammatology. Philology, involved mainly in the study of the linguistic sources of a people or a group of peoples, forms the basic means for the comprehension of their respective cultures. It deals less with oral sources than with written sources, mainly literature (whatever its exact meaning). Philology deals with the formal aspects of writing under the topic of epigraphy and paleography. Linguistics is concerned with the study of linguistic systems as reconstructed mainly from oral sources. Pursued less than the study of "oral language," the study of the "written language"—that is, of the language as it is used in written sources—is also a matter of linguistics. Linguistics deals with the structural aspects of writing under the heading of graphemics.

The field of study that deals with writing in the broadest sense is called grammatology. Equally appropriate terms for this subject are grammatonomy and graphonomy.

GRAMMATOLOGY

Three main approaches. Three main approaches to grammatology can be distinguished: descriptive-historical, typological-structural, and formal.

Descriptive-historical. The traditional descriptive-historical approach to the study of writing is by far the most common. This is a simple narrative approach to the description of writing in its historical evolution. The apparent shortcoming of descriptive-historical texts is the general lack of systematic typology—that is, systematic classification by type. Good studies on individual writings, such as hieroglyphic Egyptian and the Greek alphabet, are not wanting. What is entirely missing is theoretical and comparative evaluation of the various types of writing, such as discussions of various types of syllabaries, alphabets, word signs, and logo-syllabic writings.

The historical approach is further vitiated through confusion with considerations of a geographic nature, as evidenced by such chapter titles as "Asiatic Writings" and "American Writings," or "Writings of Asia" and "Writings of America," which are frequently found in the standard manuals on writing.

Typological-structural. The typological-structural approach is based on the realization of the importance of structure and typology in the study of writing. In contrast to the traditional approach, according to which the writings of the world are described in their evolutionary progress, the new approach requires first a thorough analysis of the structure of the individual writing systems and then their classification by type within the framework of writing in general.

The meaning of structure

Under "structure" is meant here primarily what is sometimes called the "inner structure," which is concerned with the function of a writing system, in contrast to the "outer structure," which involves its formal characteristics. Considerations of function are based on such points as word writing (logography), syllable writing (syllabography), and letter writing (alphabetography), and the typology of logographic, syllabic, and alphabetic systems of signs. Considerations of form involve such points as the contrast between the pictorial and linear systems or between the monumental and cursive writings. While, theoretically, both approaches are acceptable, the emphasis placed here on function, rather than form, may be illustrated by considering the following case. From the point of view of function, the Morse alphabet represents the same type of alphabet as the Latin writing and its descendants; from the point of view of form, the Morse alphabet is formally independent of the Latin writing. Based on considerations of function, the Morse alphabet is considered as being of the Latin type, despite its different formal, outer structure.

Formal. There are two kinds of formal approach to the field of grammatology: the traditional approach, as practiced mainly in the philological disciplines under the topic of epigraphy and paleography (see below), and the formal approach to sign analysis recently initiated in the United States. The aim of the latter is to provide a scientific account of cursive writing as practiced in that country. Its procedure consists first of breaking up the letters of the cursive writing into its component segments, which appear in the form of bars, hooks, arches, and loops, and then of providing formation rules governing the linking together of these segments into letters and into larger strings corresponding to words of the language. It is said that 18 such segments are sufficient to describe all English lower- and upper-case letters.

Subdivisions of grammatology. Three main subdivisions of grammatology can be distinguished: subgraphemics, graphemics, and metagraphemics. They are treated mainly by scholars versed in philological and linguistic disciplines.

Subgraphemics. The field of subgraphemics deals mainly with primitive forerunners of writing that utilize visual marks having no set correspondences in language. In its sublinguistic aspects, subgraphemics can be compared to kinesics, the study of the various communicational aspects of learned, patterned body motion behaviour; and cherology, the study of gesture language.

Graphemics. The field of graphemics deals with full writing or phonography, as represented in systems of writing in which written signs generally have set correspondences in elements of language. The field of graphemics thus deals with writing after it became a secondary transfer of the language, a vehicle by which elements of the spoken language were expressed in a more or less exact form by means of visual signs used conventionally. This took place for the first time about 5,000 years ago in the Sumerian and Egyptian writings.

Instead of "graphemics," other scholars use the terms "graphics" or "graphic linguistics." All three terms are frequently misused by scholars who limit the terms to the study of alphabetic writings, overlooking or paying scant attention to all other types of writing, such as the logosyllabic and syllabic systems.

Little work has been done in the field of relations of writing to language. Philologists have been concerned mainly with the historical evolution of writing and have paid little attention to the interrelations between writing and language. Linguists have been more concerned with the spoken language than with the written language. When interested in written languages, they have often limited their study to living written languages, neglecting the rich sources of information that can be culled from ancient written languages and from pre-alphabetic systems. The question of the relationship of writing to language has been pursued in recent years mainly by scholars with a background in linguistics. Because of their interest in modern languages and writings, this implies generally relations between the alphabet and language. A general treatment of the subject can be found in the respective chapters of the introductory manuals to linguistics. Linguists generally have stressed the independent character of writing and have studied it as an independent system rather than as a system ultimately based on and related to the underlying language.

While the connections between language and writing are close, there has never been a one-to-one correspondence between the elements of language and the signs of writing. The "fit" (*i.e.*, the correspondence) between language and

The growing divergence of language from writing

writing is generally stronger in the earlier stages of a certain system of writing and weaker in its later stages. This is because a writing system when first introduced generally reproduces rather faithfully the underlying phonemic structure (structure of sounds). In the course of time, writing, more conservative than language, generally fails to keep up with the continuous changes of language and, as time progresses, diverges more and more from its linguistic counterpart. A good example is the old Latin writing, with its relatively good "fit" between graphemes (the written letters or group of letters that represent one phoneme or individual sound) and phonemes as compared with the present-day French or English writing, with their tremendous divergences between graphemes and phonemes. In some cases, recent spelling reforms have helped to remedy the existing discrepancies between writing and language. The best "fit" between phonemes and graphemes has been achieved in the Korean writing in the 16th century and in the Finnish and Czech writings of modern times.

Families of writings are not related to families of languages. Note, for example, that English and Finnish are written in the Latin writing but belong to two different families of languages, and that the cuneiform writing was used in antiquity by peoples speaking many different languages.

The temporal primacy of language over writing has been taken for granted by most scholars, especially the American linguists. It has been contested by some European scholars, who claim that writing is as old as oral language and gesture language. The fact is that full writing, expressing linguistic elements, originated only about 5,000 years ago in Mesopotamia and Egypt and that full writing is therefore much younger than language. Only if the semasiographic stage is included under writing can the assumption of equal temporal hierarchy of writing and language be admitted. (Semasiography is the use of marks to convey meaning without the presence of linguistic elements.) As noted elsewhere, however, the semasiographic stage should not be treated as full writing, but as a forerunner of writing.

Metagraphemics. A study of the various metagraphic devices (*e.g.*, punctuation marks, capital or italic letter forms) that are used besides or in addition to writing proper may be called metagraphemics or paragraphemics. This is still an obscure field, and its relationship to both subgraphemics and graphemics needs a thorough investigation.

EPIGRAPHY AND PALEOGRAPHY

Definitions of epigraphy and paleography

The investigation of writing from the formal point of view has been traditionally the prime domain of the epigrapher and paleographer. Epigraphy is concerned mainly with inscriptions written in characters that are incised or scratched with a sharp tool on hard material, such as stone or metal; paleography deals mainly with manuscripts written in characters that are drawn or painted with pen, pencil, or brush on soft material, such as leather, papyrus, or paper. Since epigraphy means "writing upon something" and paleography means "old writing," it is clear that the distinction made above between epigraphy and paleography cannot be justified on etymological grounds. The distinction has grown artificially over the years, as one scholar or another began to apply one or the other term to his own branch of study of written sources. Because of the close interrelations between epigraphy and paleography, some scholars refuse to admit any distinction between the two and prefer to use only the term paleography.

The main characteristics of epigraphy and paleography as listed above may be applied, with some leeway, to the ancient Near East (Mesopotamia, Egypt, Anatolia), the classical world, China, India, the Islāmic world, and, in general, to the Western writings from the Middle Ages down to the introduction of the printing press. But there are some difficulties: Mesopotamian and Aegean clay tablets are soft, and the writing is cursively executed, both points characteristic of paleography, but the tablets are also durable and bulky and have incised, concave characters executed with a stylus, all points characteristic of epigraphy. Similarly, the wax tablets of the classical world are soft, perishable, and cursively executed, characteristics of paleography, but are written with concave characters, incised with a stylus, characteristic of epigraphy. There are likewise some difficulties in the classification of tablets of wood; they are soft and perishable, and the writing on them is generally cursive, characteristic of paleography, but they have characters incised or scratched with a sharp implement, characteristic of epigraphy.

Formal and interpretive studies

Paleography and epigraphy are involved in the study of written sources from two points of view: the purely formal aspect and the hermeneutical (interpretive) aspect.

The study of the purely formal aspect, possible without any understanding of the contents or without an extended study of the contents, is concerned, for example, with the kind, form, and size of the materials; the technique of writing; and the form, order, and direction of writing. Hermeneutics, possible only with study of the contents, is concerned, for example, with the dating and localizing of written sources, their authorship, linguistic interpretation, and content evaluation.

A general scientific discipline of epigraphy and paleography does not exist. There are no studies that treat of the subject from a general, theoretical point of view, encompassing all the written sources, wherever they may be found. There are, for example, no treatises listing and discussing the various materials, or shapes and sizes of materials, used for writing throughout the world, just as there are no structural-typological studies that treat of the formal evolution of signs from pictorial to linear or from round to angular. Among other potential topics that await investigation are: trends in ductus (hand; the general shape and style of letters), such as individual, national, and regional; the direction of writing, indication of prosodic features (quantity, stress, and tone), and names of signs (letters). The narrow fields that are represented are, for example, West Semitic epigraphy, Arabic paleography, Greek and Latin epigraphy and paleography, or Chinese epigraphy and paleography. In all cases, these narrow fields of study form subdivisions of wider but still linguistically or geographically defined fields of study, such as Semitic or Arabic philology, classical philology, Assyriology, and Sinology.

HISTORY OF THE STUDY OF WRITING

The first students of writing were doubtless the very originators ("inventors") of a new writing system. By "writing system" is meant here a full writing in which the individual signs of the writing stand for the corresponding elements of the language, which is to be contrasted with the forerunners of writing, in which the individual signs have but loose connection with language. As a result of a discrete analysis of the language for which a writing system was devised, lists of the elements of a language and their proposed written counterparts must have been first compiled and experimented with in actual practice. The establishment of a full system of writing also required conventionalization of forms and principles. Forms of signs had to be standardized so that the users would draw the signs in approximately the same way. Regulation of the system had to take place in the matter of the orientation of signs and the direction, form, and order of the lines, columns, and the sides of a text. Correspondences established between signs and words were paralleled by those between signs and definite syllabic values. After the initial period of trial and error, the established correspondences were conventionalized by being taught in schools.

Studies prior to the 18th century. The activities involved in setting up a full system of writing are indirectly attested in the Sumerian school texts, known almost from the beginnings of the Sumerian writing, which appear in the form of lists of signs and words, and scribal and literary exercises. The scribal activities of the Sumerians and, in the later periods, Akkadians are matched, albeit to a smaller degree, as far as actual attestation is concerned, by those of other peoples of the ancient Near East, such as the Egyptians and Hittites.

The Sumerian school texts

The study of the language and the corresponding writing was highly developed among the Chinese and Indic peoples, as best exemplified by the great Indic grammarian Pāṇini (about the 4th century BC) and his school, as

well as among the Greeks and to a lesser degree among the Romans. Beginning in the Middle Ages, the Arabs and Jews showed great interest in matters pertaining to their languages and writings. Important contributions were made by the Arab scholars Sībawayh (8th century) and az-Zamakhsharī (1075–1143) and by the Jews Rashi (1040–1105) and David Kimhi (*c.* 1160–*c.* 1235). Interesting, but largely fantastic, is a collection of several dozen alphabets and sign lists put together by the Arab Aḥmad ibn Abū Bakr ibn Waḥshīyah (*c.* 800). Among the early Europeans were the Spanish bishop Diego de Landa (1524–79), with his analysis of the Maya writing, and the German scholar Athanasius Kircher (1602–80), with his frequently mystic ideas about writing, especially the Egyptian hieroglyphic.

Modern Western studies. Modern general studies of writing in the West began in the second half of the 18th century. This group of early studies was based almost exclusively on Greco-Latin writing, with its further developments in the Middle Ages and modern times, and supplemented by a scattering of Semitic alphabets, such as the Hebrew, Arabic, and Syriac. The books of this first period are of no more than historical interest today.

In contrast to these early studies, the second group consists of the larger and much more serious undertakings of François Lenormant (1872), Heinrich Wuttke (1872), Carl Faulmann (1880), Isaac Taylor (1883), and Philippe Berger (1891). These books became standard manuals in the field of writing and served that function until the first half of the 20th century.

Next in time is a group of studies generally smaller in size and more limited in coverage than the group discussed just above, as represented by Walter James Hoffmann (1895), R. Stübe (1907), Theodore Wilhelm Danzel (1912), Karl Weule (1915), and William A. Mason (1920). On the basis of such monumental works on the American Indian writings as those of Henry R. Schoolcraft (1851), Garrick Mallery (1886 and 1893), and other similar works, the authors of this group of studies have emphasized much more than did the earlier scholars the importance of the forerunners of writing in the whole field of the study of writing.

The main characteristic of the next period, the first half of the 20th century, during which great manuals on writing were produced, was the descriptive-historical approach, as it was of all the preceding group of studies on writing.

The typological-structural approach to the study of writing appeared in the latter half of the 20th century, along with interest in the relationship of writing to society. Representatives of this and of the previous group are briefly characterized in the bibliography. (I.J.G./Ed.)

BIBLIOGRAPHY

General linguistics: ROBERT H. ROBINS, *A Short History of Linguistics,* 2nd ed. (1979), *General Linguistics: An Introductory Survey,* 3rd ed. (1980), is a comprehensive and balanced treatment of the whole field. LEONARD BLOOMFIELD, *Language* (1933), a classic introduction to the subject, is still not completely superseded and is essential reading for an understanding of subsequent American work. CHARLES F. HOCKETT, *A Course in Modern Linguistics* (1958), a comprehensive, stimulating, though somewhat personal textbook, represents the post-Bloomfieldian period in the United States. JOHN LYONS has produced a number of notable surveys: *Introduction to Theoretical Linguistics* attempts to synthesize more traditional and more modern ideas on language, paying particular attention to generative grammar and semantics; *New Horizons in Linguistics* (ed., 1970), contains previously unpublished chapters on developments in most areas of linguistics; *Language and Linguistics: An Introduction* (1981) is a textbook covering theoretical developments. MARTIN JOOS (ed.), *Readings in Linguistics* (1957), is an excellent selection of key articles on structuralism in the post-Bloomfieldian period. Z.S. HARRIS, *Methods in Structural Linguistics* (1951), offers the most extreme and most consistent expression of the distributional approach to linguistic analysis—important for the development of generative grammar. NOAM CHOMSKY, *Syntactic Structures* (1957), is the first generally accessible and relatively non-technical treatment of generative grammar, widely recognized as one of the most revolutionary books on language to appear in the 20th century; J.P.B. ALLEN and PAUL VAN BUREN (eds.), *Chomsky: Selected Readings* (1971), contains an annotated selection of key passages from Chomsky's main works. S. PIT CORDER (ed.), *The Edinburgh Course in Applied Linguistics,* 4 vol. (1973–77), is a collection of readings covering a wide range of views. RICHARD C. OLDFIELD and J.C. MARSHALL (eds.), *Language* (1968), J.A. FODOR, T.G. BEVER, and M.F. GARRETT, *The Psychology of Language* (1974); and JOSEPH F. KESS, *Psycholinguistics* (1976), are important works in psycholinguistics. DELL HYMES (ed.), *Language in Culture and Society* (1964), is an excellent selection of articles in sociolinguistics and anthropological linguistics. Valuable information is found in ROY HARRIS, *The Language Myth* (1981); GEORGE A. MILLER, *Language and Speech* (1981); SUSAN BASSNETT-MCGUIRE, *Translation Studies* (1981); ERIC WANNER and LILA R. GLEITMAN (eds.), *Language Acquisition: The State of the Art* (1982); and HANS AARSLEFF, *From Locke to Saussure: Essays on the Study of Language and Intellectual History* (1982).

Semantics: W.P. ALSTON, *Philosophy of Language* (1964), is the best current introduction to philosophical semantics. STEPHEN ULLMANN, *Semantics: An Introduction to the Science of Meaning* (1962), has become a classic work. M. BLACK, *Language and Philosophy* (1949), discusses some earlier views. L. BLOOMFIELD, *Language* (1933), contains a classic discussion of scientific semantics. B.L. WHORF, *Language, Thought and Reality,* ed. by J.B. CARROLL (1956), raises the issue of linguistic relativism. J.J. KATZ, *The Philosophy of Language* (1966), offers a semantic theory tied to generative grammar, the best expression of which is found in N. CHOMSKY, *Aspects of the Theory of Syntax* (1965). W.V. QUINE, *Word and Object* (1960); and P. ZIFF, *Semantic Analysis* (1960), represent two different but influential semantic theories. Philosophy of language is explored also in the following monographs: IRMENGARD RAUCH and GERALD F. CARR (eds.), *The Signifying Animal: The Grammar of Language and Experience* (1980); CHARLES ALTIERI, *Act and Quality: A Theory of Literary Meaning and Humanistic Understanding* (1981); GRAHAM D. MARTIN, *The Architecture of Experience: A Discussion of the Role of Language and Literature in the Construction of the World* (1981); NATHAN U. SALMON, *Reference and Essence* (1981); DERECK BICKERTON, *Roots of Language* (1981); SÁNDOR HERVEY, *Semiotic Perspectives* (1982); JEREMY CAMPBELL, *Grammatical Man: Information, Enthropy, Language, and Life* (1982); ANNETTE LAVERS, *Roland Barthes, Structuralism and After* (1982); and DAVID LIGHTFOOT, *The Language Lottery: Toward a Biology of Grammars* (1982).

Periodicals: Language, Word, International Journal of American Linguistics (United States); *Philological Society Transactions, Journal of Linguistics* (Great Britain); *Lingua, Studies in Language* (Holland); *Bulletin de la Société de Linguistique de Paris* (France).

(Ed.)

Lisbon

Lisbon (Portuguese: Lisboa), the capital of Portugal and of the district that bears its name, is the nation's chief port, largest city, and commercial, political, and tourist centre. It stands on the westernmost point of land of continental Europe. The city's name is a modification of the ancient Olisipo (variant Ulyssipo), and its founding has been variously attributed to Ulysses (Greek: Odysseus), the hero of Homer's *Odyssey,* to Elisha, grandson of the Hebrew patriarch Abraham, and, more credibly, to Phoenician colonists.

Lisbon owes its historical prominence to its superb natural harbour, one of the most beautiful in the world. The city lies on the north bank of the Tagus River (Rio Tejo), about eight miles (13 kilometres) from the river's entrance into the Atlantic Ocean. From the ocean upstream to the city, the river is almost straight and about two miles wide. It is spanned, on the west side of the city, by the 25th of April Bridge (formerly called the Salazar Bridge), the longest suspension bridge in western Europe. Just east of the bridge, the Tagus suddenly broadens into a bay seven miles wide called the Sea of Straw (Mar de Palha)—a reference to the sheen of the water. Scenically spectacular though it may be, this hill-cradled bay of burnished water lies on a strategic sea route and serves as a busy port, handling much of the exports and imports of Portugal and Spain.

This article is divided into the following sections:

Physical and human geography

CHARACTER OF THE CITY

Once a remote outpost on what was thought to be the farthest edge of the known world, by the 15th century Lisbon was established as the centre of operations for Portuguese exploration. Although this seagirt city of white houses and elegant parks and gardens is no longer the capital of a vast overseas empire, it remains a busy commercial and tourist centre. Lisbon has exchanged the sounds of the past—the cries of Galician water-carriers and of bakers bearing huge baskets of bread, the whistles of knife-grinders, the bagpipes of peasants from the north—for the honking of congested motor traffic and the clang of trams.

Some traditions remain, however. One can still see in the streets *varinas* (fish sellers), dressed in long, black skirts, carrying their wares in baskets on their heads; and one can still hear sung in the little cafés of the medieval Alfama quarter the sad, romantic music called fado. The port maintains an intimacy with its city that was common in the days before steam. Amid the freighters, warships, liners, and ferryboats, a picturesque note is struck by the *fragatas,* of Phoenician origin; these crescent-shaped boats with their striking black hulls and pink sails still perform most of the harbour's lighterage. Vessels tie up at quays open to the everyday life of the town, where the clang of the trolley cars blends with the sound of ships' bells. At dawn, fishing smacks deposit their catch at the town's front doorstep for noisy auction to Lisbon dealers, while the *varinas* wait to fill the baskets they peddle through the streets. Farther within, the fish market gives way to the equally colourful and clamorous fruit and vegetable market. Despite modernization, Lisbon, in many ways, retains the air of a 19th-century city.

THE LANDSCAPE

The city site. Lisbon is built in a succession of terraces up the slopes of a range of low, rolling hills, which rise from the banks of the Tagus River and the Sea of Straw northwest toward the Sintra Mountains, whose covering of lush Mediterranean and north European flora provides an attractive retreat for the city's population. Sections of the city vary considerably in height, especially in the older areas along the water's edge, offering splendid views of the river and the low cliffs that line the river's southern shore.

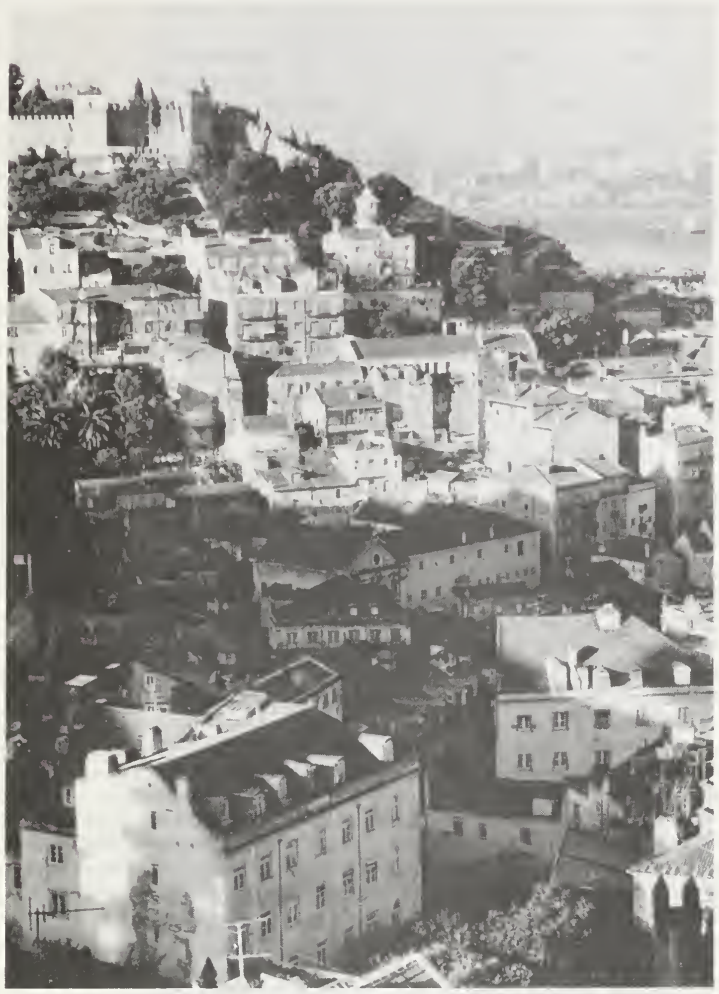
Several geologic faults cross Lisbon and the surrounding region. A major earthquake devastated the city in 1755, but seismic activity in the 20th century has been limited to slight tremors.

Climate. Lisbon has a mild and equable climate, with a mean annual temperature of 63° F (17° C). The proximity of the Atlantic and the frequency of sea fogs keep the atmosphere humid, and summers can be somewhat oppressive, although the city has been esteemed as a winter health resort since the 18th century. Average annual rainfall is 26.6 inches (666 millimetres).

The role of the river

The city layout. It is traditional for Lisbon's poets to refer to the entwining Tagus as the city's lover. The river is indeed an ever-present part of the city's decor, and the official entrance to Lisbon is a broad marble stair mounting from the water to the vast, arcaded Commerce Square (Praça do Comércio). The three landward sides of the square are surrounded by uniform 18th-century buildings, sea-green and white. This formal, Baroque-flavoured composition is pierced by a monumental archway, built a century later, marking the entry into the central city. In the middle of the square, surrounded each day by a regiment of parked automobiles, stands a bronze statue of King Joseph (José) I, on horseback, from which derives the nickname given the area by English sailors, Black Horse Square.

The square lies at the south end of Lisbon's central district, the Cidade Baixa ("Lower City"). The Baixa area was completely rebuilt after the earthquake in 1755 under the supervision of Joseph I's prime minister, Sebastião de Carvalho, later the marquês de Pombal. The streets are laid out in a grid pattern broken by spacious squares. A series of parallel streets, each named for its original intended occupants (*e.g.,* Rua Áurea ["Golden Street"] for the goldsmiths), run north from Commerce Square to Dom Pedro IV Square, commonly known as Rossio Square. The Rossio is a traditional centre of activity and the starting point of the city's main promenade, the wide, gently sloping Avenida da Liberdade. This tree-lined boulevard leads north from the city centre to more modern sections of the town.



Central Lisbon and the Tagus River, with the Castle of St. George on the hilltop.
Robert Frerck/Odyssey Productions

To the east of the Baixa lies the Alfama, the oldest part of the city, where narrow, winding streets crowd down to the river between a jumble of houses. In this area, from the hill where Lisbon was first founded, the Castle of St. George (São Jorge) watches over the city. The castle, like most of the buildings in the Alfama, is Moorish in origin; it was named for England's patron saint, in honour of an alliance made in 1386. Just below it, the austere, white Church of St. Vincent-Outside-the-Walls guards the remains of the saint, which were—according to legend—miraculously brought to the city in a ship guided by two ravens. To commemorate the event, the birds are depicted on the Lisbon coat of arms.

A number of neighbourhoods extend west of Cidade Baixa toward the suburb of Belém. Each possesses its own distinctive character, reflecting the epoch in which it was built. The Bairro Alto ("Upper District"), for example, dates primarily from the 17th century. It is characterized by its straight, narrow, steeply inclined streets. Some of its streets, especially those leading down to the Baixa, are so steep that they give way to stairs, cable cars, and even an elevator (an iron structure designed by the French engineer Gustav Eiffel).

Despite new construction, the general outlines of the city remain as they were. It is still a city of balconies and vistas. On 17 of its prominences (many Lisboans profess to see only seven traditional hills, as in Rome) the *miradouros,* which are garden balconies maintained by the municipality, are still frequented by citizens of all ages.

Housing. New housing projects, hotels, and offices have begun to change the city. The pastel-tinted and somewhat sleepy Lisbon that offered a neutral, 19th-century haven to 200,000 war refugees in the 1940s has disappeared in the din and dust of new construction. Lisbon has emerged as a bustling modern metropolis.

Pombal's Baixa remains rigorously protected from change, but the four-story buildings of the Avenida da Liberdade and its ancillary streets have been almost totally replaced by 10-story buildings in a bland modern style. The new construction has also gained the hills, even the Alfama, whose established residents continue to hang laundry across the narrow streets and to grill sardines on doorstep braziers.

The municipality has built new neighbourhoods in the northern and northwestern sectors of town. Other developments have pushed westward toward Belém as a replacement for decayed neighbourhoods. These modern structures, some of them 14 stories high, are designed by Lisbon architects, who produce handsome, colourful, contemporary buildings. Most of the new lodgings are reserved for the poorest families (a certain number pay nothing at all) and for people of moderate means. The Chelas District project, implanted on heathland previously considered too difficult to build upon, houses about 10 percent of the Lisboan population. Despite these projects, adequate housing remains a problem, and a number of shantytowns have developed on the periphery of the city. Many affluent families have moved out of town, and more and more villas have appeared in the countryside of the "Portuguese Riviera," which lies between Lisbon and the town of Estoril, 16 miles to the west. *New housing*

THE PEOPLE

Although the district of Lisbon occupies only about 3 percent of Portugal's total area, it contains more than 20 percent of the country's population. Similarly, the city proper occupies approximately 3 percent of Lisbon district, but roughly 40 percent of the district's residents live in the city. The area has long been a magnet for rural immigration. The population is predominantly Portuguese, but there are some foreign residents, mostly diplomats and merchants in the import-export business. Lisbon, judged by net median family income, is the capital of western Europe's poorest people.

For centuries the Lisboans have discussed the symptoms of an affliction said to be endemic in this strip of the Iberian Peninsula: *saudade,* generally translated as "melancholy," a variety of a state of anxiety tempered by fatalism. *Saudade* is said to be reflected in the fado, which is sung in its original form only in Lisbon, and in Lisbon only in the two hillside precincts of Alfama and Bairro Alto. The word fado means "fate," usually an unkind fate described in the songs that are throbbingly sung to a penetrating but melodic music. *Saudade*

Portugal is an essentially Roman Catholic country, and Lisbon is distinguished as one of the three places in the world whose chief Roman Catholic clergyman bears the title of patriarch. The Lisboans are typically less devout than northern Portuguese, however, using the church mainly for family occasions: christenings, weddings, and funerals. Religious processions are generally subdued affairs, without the colour and the drama found in Spain. The June feasts of the popular saints (St. Anthony, St. John, and St. Peter) are exceptions. The Lisboans celebrate by donning imaginative costumes, jumping over bonfires, and dancing in the streets until dawn. Indeed, these lively events, held in the small quarters near the Castle of St. George, retain all the pagan elements of a midsummer festival.

THE ECONOMY

Industry. To the long-established local industries of soapmaking, munitions, and steel manufacture have been added glassmaking, electronics, margarine manufacture, and diamond cutting. The petroleum refinery, largely state supported, has also been expanded.

The greatest development in recent years, however, has come just outside the city limits on the south bank of the Tagus; the district has become Portugal's most important manufacturing centre. The industrial belt has continued to grow from the river down to Setúbal, which is 25 miles south. One of the world's largest cement plants is found on the far bank, along with grain elevators, a steelmaking complex, a cork factory, and a plastics plant.

The port of Lisbon, with 19 miles of docks, now has

special facilities for the handling of container-ship cargoes and for car ferries, and it continues to undergo expansion. Cotton, grain, and coal are important imports.

The role of tourism

Commerce and finance. Tourism and commerce have played a major part in Lisbon's modernization, and revenues from tourism have helped offset usually negative national trade balances. With the increase in population and the spread of hotels, offices, and apartment blocks throughout the city, banks have proliferated. Shops are concentrated around the Rua Garrett and the Baixa, though good shopping centres have grown up in the new residential districts toward the airport. The city's major market is located in the riverside square near the Cais do Sodré railway station.

The commercial docks, situated in Alcântara, west of Cidade Baixa, have refrigeration plants located close by to handle the catches of sardines and tunny on which the trawler fleet's livelihood has long been based.

Transportation. Lisbon is connected by rail and road to the interior of Portugal and to the rest of Europe. The airport, at Portela de Sacavém, some six miles beyond the city, has flights to Europe, the Americas, Africa, and the Middle East. The 25th of April Bridge has been the main roadway into the city since it was built in the mid-1960s. The first bridge in Lisbon's long history to span the Tagus, it is more than 7,470 feet (2,277 metres) from anchorage to anchorage, with a central span of about 3,323 feet suspended 230 feet above mean water level. There is space under the roadway to carry two railroad tracks.

ADMINISTRATION AND SOCIAL CONDITIONS

Government. As the capital of Portugal, Lisbon and its surrounding suburbs house all of the principal institutions of the republic. Many government offices occupy the 18th-century buildings that surround Commerce Square. The nation's parliamentary body meets at the Palace of the National Assembly (Palácio da Assembléia Nacional), which also houses the National Archives. Located on the west side of the Bairro Alto, the 17th-century buildings were originally occupied by the convent of São Bento da Saúde. Farther west, toward Belém, the Necessidades Palace (Palácio das Necessidades) houses the Ministry of Foreign Affairs. Built in the mid-18th century on the site of a chapel (for which it is named), it was, until 1910, a royal palace. Another royal palace, built in Belém in 1700, is now the official residence of the president of Portugal.

Like Portugal's 21 other administrative districts, the district of Lisbon is headed by a civil governor who is appointed by and responsible to the central government through the Minister of the Interior. The district is divided into municipalities (*concelhos*), which are further subdivided into wards (*bairros*) and parishes (*freguesias*). Representatives to parish assemblies are chosen through local elections. They then elect an executive body, the parish committee. Lisbon's Municipal Assembly consists of representatives chosen by their parish committees and members directly elected by the local citizens. It serves as the legislative branch of local government and elects the executive branch, the Municipal Chamber, which is headed by a president appointed by the district governor.

Municipal services

Services under the jurisdiction of the municipality include the city waterworks, road maintenance, and sanitation. The money for these services is provided by grants from the central government and through local taxes.

Health. As a major urban centre, Lisbon has a higher percentage of doctors and other health professionals than the rest of Portugal. The city's hospitals include state, private, and military establishments. There are no hospitals run by the municipality. State hospitals are handicapped by the scarcity of public funding. As a result they are insufficiently staffed and, in some cases, inadequately equipped to cope with the demands put on their services. English, French, and Hebrew hospitals cater largely to their small, respective communities.

Education. Officially, education in Portugal is free and compulsory for children ages six through 14, but the number of public schools in Lisbon is insufficient for the city's population. Private schools fill the gap to a certain extent. The University of Lisbon was founded in 1290 and remained Portugal's only university until the 16th century. It was moved back and forth between Lisbon and Coimbra until 1537, when it was renamed and permanently located in Coimbra. Thus, Lisbon was left without a university until 1911, when a second University of Lisbon was established. The Technical University of Lisbon was founded in 1931, and three more universities were opened in the city during the 1970s. Despite this effort to expand educational opportunities, the number of university applicants far exceeds the number of available places.

CULTURAL LIFE

Lisbon's Calouste Gulbenkian Foundation and Museum, a cultural centre named for its benefactor, an Armenian oil-lease negotiator, presents music and ballet as well as exhibits of the other fine arts. It also houses the broad-ranging personal collection that Calouste Gulbenkian, who lived in Lisbon from 1942 until his death in 1955, willed to the Portuguese nation.

The city has more than a dozen other museums, including those of modern, antique, sacred, decorative, and folk arts. In the latter are found many beautiful native artifacts. Two specialized, rather unusual museums are the Azulejo Museum and the Coach Museum. The former, located in the convent of Madre de Deus, boasts a large and varied collection of the painted tiles (*azulejos*) for which the Iberian Peninsula is famous. The Coach Museum occupies a wing of the Portuguese president's official residence and contains an impressive display of carved and gilded coaches.

Lisbon's municipal orchestra was founded in 1971. The National Conservatory offers advanced instruction in both music and drama. The city has two principal theatres, the St. Charles (São Carlos) and the National Theatre of Dona Maria II. The St. Charles, which was constructed in the late 18th century, has a beautiful elliptical interior, and the National, which was built about 1845, displays a facade of six giant columns saved from the convent church of St. Francisco, which was destroyed by earthquake. The interior, gutted by fire in 1966, has been restored.

Theatres and theatrical churches

Neither of these edifices is as theatrical as the interiors of some of the churches built or restored after the 1755 earthquake. In gold, marble, carved wood, and rare tiles, these interiors are decorated in Baroque, Rococo, or rocaille. One outstanding example is the 16th-century church of São Roque, whose unpretentious exterior belies its opulent collection of *azulejos*, paintings, and mosaics inlaid with semiprecious stones.

The old, red brick bullring with its Moorish arches and cupolas still finds an audience for its spectacles. In Portuguese bullfights the bull's first opponent is either a *cavaleiro* on horseback or a *toureiro* on foot. The performance of either man is judged by his dexterity, courage, and proximity to the bull. Next, a squad of acrobatic men, the *forcados*, wrestle the bull, eventually immobilizing it with their bare hands. The bull is not slain.

Lisbon has several other sports and recreational areas. Residents can travel several miles north or west to one of the three major football (soccer) stadiums. Many of the housing developments are planted with trees and grass, their small parks adding to Lisbon's collection of more than 40 public gardens. The largest public park, Monsanto, covers about eight square miles and has numerous recreational facilities. Its rolling hills were planted in the 1920s to provide a windbreak for the town and are now thickly forested. There are also two botanical gardens and a zoological garden within the city.

History

THE EARLY PERIOD

Prehistoric to Moorish times. The valley in which the heart of Lisbon now lies was, in prehistoric times, the bed of a forked branch of the Tagus. (The subway now forks at the same spot.) No evidence has been uncovered to show who were the first residents on the hills surrounding the valley. Although it seems likely that the city was founded *c.* 1200 BC as a trading station by the far-ranging Phoenicians, there is no unassailable proof of the story.

Origins of the city

The city's ancient name, Olisipo, may be derived from the Phoenician *alis ubbo* ("delightful little port") or from the legend that the city's founder was Ulysses.

Whatever the city's origins, it is known that the area was under Roman domination from 205 BC to *c.* AD 409 and that Julius Caesar raised the settlement to the dignity of a *municipium* and named it Felicitas Julia. A few inscribed stones remain as evidence of the Roman presence. The Romans lost the city to the migratory peoples known as the Alani, who were driven out by the Suebi, who in turn were conquered by the Visigoths. The base plan of the original fortifications is thought to be Visigothic and, if so, is the sole vestige of their reign.

The Muslims of North Africa took Lisbon when they overran the Iberian Peninsula in the 8th century; they stayed for 433 years, despite incursions by the Normans in 844 and by Alfonso VI of Castile and León in 1093. Under the Moors the city was known under variations of "Lisbon": Luzbona, Lixbuna, Ulixbone, and Olissibona. Some authorities contend that the Muslims took this name from the conquered Roman castle, but Lisbon historians suggest that it derives from *água boa* ("good water").

The Portuguese conquest. Behind their walls, the Moors were able to hold out for months when the city was assailed by crusader forces—English, Flemish, Norman, and Portuguese under Afonso Henriques, the Portuguese king. The city finally fell in 1147 and successfully resisted Moorish attempts to win it back. The Moorish alcazar was transformed into a Portuguese royal palace, and, according to legend, the Lisbon Cathedral (Sé Patriarcal) was converted from a mosque (with subsequent restorations in the styles of many periods after fires and earthquakes). There is no evidence, however, of a building on the site of the cathedral before the time of Afonso Henriques.

Although 1,400 years of occupation and invasion have left almost no trace among the stones of the capital, the presence of the outlander is still visible in the faces of the inhabitants, which range in cast from the Scandinavian to the Mauritanian.

After winning Lisbon, King Afonso established his court 105 miles to the north-northeast, atop a cliff at Coimbra. Lisbon did not become the national capital until more than a century later, in 1256. Within its Moorish walls, of which some traces still remain, medieval Lisbon measured 1,443 feet at its widest and 1,984 feet at its longest, descending the hill below the castle. Even before the Portuguese conquest, some houses had already been built outside the walls toward the river. The site of this first Lisbon is occupied by the lively Alfama quarter, which has kept the labyrinthine medieval street plan.

The medieval core

King Dinis I (1279–1325) decreed that Portuguese, the dialect of the Porto region, was to be the national language. He founded the university in Lisbon in 1290, and during his reign, other hilltops around the central valley were crowned with convents and churches.

In 1372–73 Lisbon was besieged and burned by the Castilians, who forced King Ferdinand I, an unsuccessful contender for the Castilian throne, to repudiate his alliance with England; thereafter the King swiftly erected new defenses. His wall—more than three miles long, with 77 towers and 38 gates and enclosing more than 247 acres—withstood the renewed Castilian attack of 1384, which followed Ferdinand's death.

The Age of Discovery. When the Portuguese Age of Discovery (1415–1578) began, a census of Lisbon showed 65,000 inhabitants occupying 23 parishes. A considerable number of these residents became rich, and the city was endowed with larger and more luxurious buildings. African slaves became a familiar Lisbon sight, the trade in slaves being one in which Portugal played a major role. After the great explorer Vasco da Gama led a Portuguese fleet to India in 1498, the Venetian monopoly on Oriental trade was broken; and colonies of German, Flemish, Dutch, English, and French traders established themselves in Lisbon. Greeks, Lombards, and Genoese who had lost their trading enclaves in Constantinople when that city fell to the Turks in 1453 also came to Lisbon.

King Manuel I (1495–1521) dominated this epoch, and under his rule Portugal developed its sole contribution to European architecture, an extreme style of late Gothic decoration that celebrated the voyages of discovery, Manuel, and God. The prime examples of Manueline style at Lisbon, the Tower of Belém and the Jerónimos Monastery, about four miles downstream from the city centre, are far less exuberant than those at the rival Portuguese cities of Batalha and Tomar. The tower and the monastery are nevertheless the most important architectural monuments in the Lisbon area. The five-story Tower of Belém, located on the riverbank, was built in 1515 as a fort in the middle of the Tagus, which subsequently altered course. Girt by a cable carved in the stone, it has a stern Gothic interior but exhibits its North African touches on its turrets and crenellations and presents rounded Renaissance arches for the windows. The monastery with its church and cloisters was begun in 1502 by Boytac (Boitaca), an architect of French origin, and was not finished until the end of the century. Four other architects worked on the project, their styles passing from the Gothic through the Renaissance to the Baroque. Smoothed by time, the ensemble is harmonious and proudly Portuguese.

Manuel I promoted the urbanization of the central valley between Lisbon's hills, creating a city square, the Rossio, which at once became a popular meeting place. By the Tagus he constructed a new palace, the Paços da Ribeira, with a large square laid out along its eastern flank. The area between the Rossio and the Palace Terrace (Terreiro do Paço) was soon crisscrossed with streets, along which rose the new shops, churches, and hospitals of what had become a phenomenally prosperous city.

Decline in the 16th century

The prosperity was chimerical, however. John (João) the Pious, who had succeeded Manuel, permanently transferred (1537) the university to the royal palace at Coimbra, far from the capital's excesses. He also invited the Jesuits and the Inquisition to come to Portugal to counter the ungodly materialism of Lisbon. The Inquisition office, located in the Rossio, was particularly ferocious in its persecution of the Jews, who were the bankers, financiers, and moneylenders of the time. Many wealthy Jews had their property and goods confiscated; some emigrated to Holland and other countries, taking their money and financial expertise with them. As a result, Lisbon's connections with foreign markets were disrupted and the country's economy suffered severe financial constraints.

Lisbon was visited with plagues and earthquakes during this time, but they proved easier to meet than the cost of 50 years of glory. Literally half the nation's population had vanished in pursuit of wealth in the new colonies. With farms deserted, food was imported from other European countries at crippling prices, and with so many skilled men absent, wages rose sharply, as did the cost of building and manufacturing materials. The colonial treasures, which had made Lisbon such a sybaritic queen of the seas, in the end cost more than they could fetch.

In 1578 King Sebastian of Portugal was killed in a disastrous invasion of Morocco: two years later, the Spanish pushed into Portugal, and Philip II of Spain became king of both countries. In 1588 it was from Lisbon that the Invincible Armada sailed against England, Portugal's oldest ally. In the half century that followed, Lisbon lived relatively well as a port for the riches of the Spanish Main. In 1640 a conspiracy of Lisbon nobles struck for freedom and drove out the Spaniards, restoring Portugal's independence. The square just north of the Rossio, Restoration Square (Praça dos Restauradores), is named for them.

With the Cromwellian treaty of 1654, following British military assistance to the Portuguese in the war with Spain, the British merchants trading and living in Lisbon set up a corporation, which became known as the British Factory. The Factory negotiated with the Portuguese government for trade concessions and other privileges, appealing to the British government to put pressure on the Portuguese authorities when necessary. Britain's economic and political influence on Portugal was strong, and the Factory remained in existence until 1810.

EVOLUTION OF THE MODERN CITY

Disaster and reconstruction. In the first half of the 18th century the profits from the plantations and the gold

The Jerónimos Monastery in Lisbon.
Colour Library International

and diamond deposits of Brazil brought a new flurry of optimism and excitement to Lisbon. This ended on the morning of Nov. 1, 1755. The churches were crowded to honour the dead on All Saints' Day when the city was devastated by one of the greatest earthquakes ever recorded. There were two shocks, 40 minutes apart; and the waters of the Tagus, lifted from their bed, roared through the city, followed by fire. It is believed that 30,000 lives were lost, and more than 9,000 buildings were destroyed.

The great earthquake of 1755

Physically, Lisbon recovered with a celerity astonishing for the time, but the shock left its mark upon the thinking of generations to come. The reconstruction—a good deal of foreign aid was forthcoming—was achieved by Joseph I's prime minister, Sebastião José de Carvalho, the virtual ruler of the nation. He put Manuel da Maia, engineer in chief of the realm, in charge of five architects and soon had a plan for remaking the totally devastated centre of the town, the Baixa. The riverside palace had been destroyed, and its terrace was expanded to create the new Commerce Square. Northward from there, a grid of 48 streets led inland to the Rossio and a neighbouring new square, Figueira. The two-story, uniform buildings were topped by two tiers of dormers projecting from tiled roofs. The corners of the eaves, in the Lisbon tradition, turned up, in faint echo of a pagoda. The building style, evolved for fast, cheap construction, was Baroque but virtually stripped of decoration. After the minister was rewarded with the title of marquês de Pombal, the style became known as the *estilo pombalino.*

The Sé and most of the churches were repaired or rebuilt, but the 14th-century Carmel (Carmo) Church was left as it was. Looming from its hilltops over the Baixa, the roofless Gothic shell now serves as an archaeological museum, while its cloister serves as the barracks for the National Republican Guard, a paramilitary security force. The Palace of the Inquisition, utterly flattened, was not rebuilt when Pombal enlarged and realigned the Rossio, and on its site, 90 years later, the National Theatre of Dona Maria II was erected. Pombal banished the Jesuit order and transformed their establishment into St. Joseph's Hospital to replace the destroyed All Saints Hospital. The medical school scrambled for room at St. Joseph's until it acquired a new building of its own late in the 19th century. The Jesuit novice house was converted to serve as the Nobles' School. Later governments expelled more religious orders, whose buildings became barracks, hospitals, royal academies, and government offices.

19th-century expansion. During the Peninsular War of the early 1800s, Lisbon alternated between French and British control, and after Napoleon's defeat it was embroiled in civil war until 1834. That conflict was followed by 10 years of revolutionary outbursts. Nineteenth-century Lisbon nevertheless continued to expand and, by 1885, embraced 20,378 acres, while the population had doubled in 100 years to reach 300,000. Public buildings, such as the new city hall and the Ajuda Royal Palace, had been built, and the harbour had been modernized and quays constructed on land reclaimed from the river. The railway had appeared, and a system of horse cars served the lower town.

The greatest change in the city, and the one most important for its future growth, was the opening of a new main street in 1880—the Avenida da Liberdade. The municipality bordered the central six-lane carriageway with wide blue mosaic sidewalks graced with palms and shade trees, fountains, and ornamental waters stocked with goldfish and swans. So the street remains today, with the addition of outdoor cafés beneath the trees.

The opening of Avenida da Liberdade

In conjunction with the new thoroughfare, a series of new streets, the "Avenidas Novas," expanded the city northward, and new neighbourhoods sprang up as well on the borders of the Avenida da Liberdade. In 1901 the electric streetcar made its appearance, enabling more people to live farther away from their employment in the Baixa. Three cable cars shuttled up and down the adjacent hills, and Eiffel designed the giant elevator that hisses grandly between the town's upper and lower levels.

New water supplies, augmenting those of the 1748 aqueduct of Águas Livres, were introduced from Alviela. Consequently, water was piped directly into houses, eliminating the ancient calling of *galego,* or water porter.

The 20th century. In 1908 Portugal's king and crown prince were assassinated on the northwest corner of Commerce Square. Two years later the new king, Manuel II, abdicated. A republic was declared, and a period of national instability ensued. When António Salazar took control of the near-bankrupt nation in 1932, he erected a corporate state of which he alone determined the policies until his retirement in 1968. There was considerable development in Lisbon throughout this time, and during World Wars I and II, in which Portugal was neutral, the city was able to offer refuge to some 200,000 foreigners.

In the 1960s national policy began to change, allowing economic expansion. The 30-year-old austerity program of stability and self-sufficiency (at an admittedly low level of investment and consumption) was somewhat softened, and international tourists and international corporations began to be accommodated. In 1966, well ahead of schedule (and with $77,000,000 in aid from the United States), the Salazar (now the 25th of April) Bridge was completed.

An era of expansion

On April 25, 1974, the government of Marcelo Caetano, Salazar's successor, was overthrown by a military coup. By the early 1980s, however, political instability and economic difficulties remained serious problems and hindered the nation's, and the city's, efforts to bring about social and economic reforms. (B.E./L. de S.R.)

In 1988 a fire destroyed much of the city's historic Chiado district, which was rebuilt into a shopping and cultural centre during the 1990s. Lisbon was designated a European City of Culture in 1994. The city's landscape was altered in 1998, when Lisbon hosted the World's Fair (Expo '98), which sparked the biggest renewal project since the 1755 earthquake and tidal wave. New facilities included the cable-stayed Vasco Da Gama Bridge, the Oceanário de Lisboa (Europe's largest oceanarium), and marinas, hotels, and commercial complexes along the Tagus. (Ed.)

BIBLIOGRAPHY

The Art of Literature

The current meaning generally attached to the term literature—a body of writing by a people or by peoples using the same language—is a relatively modern one. The term itself, derived from the Latin word *littera* ("letter of the alphabet"; *litterae,* "letters"), is ancient enough; but in ancient times literature tended to be considered separately in terms of kinds of writing, or genres as they came to be called in the 18th century when the term literature took on its modern meaning. Thus Aristotle's *Poetics,* though it is concerned with and gives examples from Greek epic and dithyrambic poetry and comedy, has as its central concern tragedy.

The sections that make up this article are arranged roughly in a chronological order according to the mediums of verse and prose with attention, again mainly chronological, to various genres. No such classification is totally satisfactory. Furthermore, although the derivation of the word literature implies writing, there is much oral literature, a general treatment of which may be found in the article FOLK ARTS: *Folk literature.*

There is a further complication: literature as a whole and in its parts means various things to various writers, critics, and historians. At one extreme, it may be held that anything written is literature. Though this position is seldom held, that at the other extreme—literature is only the *Iliad,* the *Odyssey,* and *Hamlet*—is slightly more popularly held. Between these extremes, attitudes vary widely. For some critics, a hierarchy exists: tragedy is superior to comedy; the short story is inferior to the novel. For other critics, qualitative criteria apply: poetry is verse that succeeds; the limerick and nonsense verse are failed poetry. Critics also differ on the purpose or ends of literature. Many ancient critics—and some modern ones—hold that the true ends of literature are to instruct and delight. Others—a majority of the modern ones, probably—hold that pleasure is the sole end. All of these divergences and other similar ones appear in the treatments that follow.

For historical treatment of various literatures, see the article LITERATURE, THE HISTORY OF WESTERN, and sections in the articles AFRICAN ARTS, CENTRAL ASIAN ARTS, OCEANIC ARTS, and SOUTHEAST ASIAN ARTS. Some literatures are treated separately by language, by nation, or by special subject (*e.g.,* CELTIC LITERATURE, LATIN LITERATURE, FRENCH LITERATURE, JAPANESE LITERATURE, BIBLICAL LITERATURE).

The article is divided into the following sections:

THE SCOPE OF LITERATURE

Literature is a form of human expression. But not everything expressed in words—even when organized and written down—is counted as literature. Those writings that are primarily informative—technical, scholarly, journalistic—would be excluded from the rank of literature by most, though not all, critics. Certain forms of writing, however, are universally regarded as belonging to literature as an art. Individual attempts within these forms are said to succeed if they possess something called artistic merit and to fail if they do not. The nature of artistic merit is less easy to define than to recognize. The writer need not even pursue it to attain it. On the contrary, a scientific exposition might be of great literary value and a pedestrian poem of none at all.

Distinction between poetry and verse

The purest (or, at least, the most intense) literary form is the lyric poem, and after it comes elegiac, epic, dramatic, narrative, and expository verse. Most theories of literary criticism base themselves on an analysis of poetry, because the aesthetic problems of literature are there presented in their simplest and purest form. Poetry that fails as literature is not called poetry at all but verse. Many novels—certainly all the world's great novels—are literature, but there are thousands that are not so considered. Most great dramas are considered literature (although the Chinese, possessors of one of the world's greatest dramatic traditions, consider their plays, with few exceptions, to possess no literary merit whatsoever).

The Greeks thought of history as one of the seven arts, inspired by a goddess, the muse Clio. All of the world's classic surveys of history can stand as noble examples of the art of literature, but most historical works and studies today are not written primarily with literary excellence in mind, though they may possess it, as it were, by accident.

The essay was once written deliberately as a piece of literature: its subject matter was of comparatively minor importance. Today most essays are written as expository, informative journalism, although there are still essayists in the great tradition who think of themselves as artists. Now, as in the past, some of the greatest essayists are critics of literature, drama, and the arts.

Some personal documents (autobiographies, diaries, memoirs, and letters) rank among the world's greatest literature. Some examples of this biographical literature were written with posterity in mind, others with no thought of their being read by anyone but the writer. Some are in a highly polished literary style; others, couched in a privately evolved language, win their standing as literature because of their cogency, insight, depth, and scope.

Many works of philosophy are classed as literature. The *Dialogues* of Plato (4th century BC) are written with great narrative skill and in the finest prose; the *Meditations* of the 2nd-century Roman emperor Marcus Aurelius are a collection of apparently random thoughts, and the Greek in which they are written is eccentric. Yet both are classed as literature, while the speculations of other philosophers, ancient and modern, are not. Certain scientific works endure as literature long after their scientific content has become outdated. This is particularly true of books of natural history, where the element of personal observation is of special importance. An excellent example is Gilbert White's *Natural History and Antiquities of Selbourne* (1789).

Role of oratory in literature

Oratory, the art of persuasion, was long considered a great literary art. The oratory of the American Indian, for instance, is famous, while in classical Greece, Polymnia was the muse sacred to poetry and oratory. Rome's great orator Cicero was to have a decisive influence on the development of English prose style. Abraham Lincoln's Gettysburg Address is known to every American schoolchild. Today, however, oratory is more usually thought of as a craft than as an art. Most critics would not admit advertising copywriting, purely commercial fiction, or cinema and television scripts as accepted forms of literary expression, although others would hotly dispute their exclusion. The test in individual cases would seem to be one of enduring satisfaction and, of course, truth. Indeed, it becomes more and more difficult to categorize literature, for in modern civilization words are everywhere. Man is subject to a continuous flood of communication. Most of it is fugitive, but here and there—in high-level journalism, in television, in the cinema, in commercial fiction, in westerns and detective stories, and in plain, expository prose—some writing, almost by accident, achieves an aesthetic satisfaction, a depth and relevance that entitle it to stand with other examples of the art of literature.

LITERARY COMPOSITION

Critical theories. *Western.* If the early Egyptians or Sumerians had critical theories about the writing of literature, these have not survived. From the time of classical Greece until the present day, however, Western criticism has been dominated by two opposing theories of the literary art, which might conveniently be called the expressive and constructive theories of composition.

The Greek philosopher and scholar Aristotle (384–322 BC) is the first great representative of the constructive school of thought. His *Poetics* (the surviving fragment of which is limited to an analysis of tragedy and epic poetry) has sometimes been dismissed as a recipe book for the writing of potboilers. Certainly, Aristotle is primarily interested in the theoretical construction of tragedy, much as an architect might analyze the construction of a temple, but he is not exclusively objective and matter of fact. He does, however, regard the expressive elements in literature as of secondary importance, and the terms he uses to describe them have been open to interpretation and a matter of controversy ever since.

The 1st-century Greek treatise *On the Sublime* (conventionally attributed to the 3rd-century Longinus) deals with the question left unanswered by Aristotle—what makes great literature "great"? Its standards are almost entirely expressive. Where Aristotle is analytical and states general principles, the pseudo-Longinus is more specific and gives many quotations: even so, his critical theories are confined largely to impressionistic generalities.

Constructive and expressive theories of criticism

Thus, at the beginning of Western literary criticism, the controversy already exists. Is the artist or writer a technician, like a cook or an engineer, who designs and constructs a sort of machine that will elicit an aesthetic response from his audience? Or is he a virtuoso who above all else expresses himself and, because he gives voice to the deepest realities of his own personality, generates a response from his readers because they admit some profound identification with him? This antithesis endures throughout western European history—Scholasticism versus Humanism, Classicism versus Romanticism, Cubism versus Expressionism—and survives to this day in the common judgment of our contemporary artists and writers. It is surprising how few critics have declared that the antithesis is unreal, that a work of literary or plastic art is at once constructive and expressive, and that it must in fact be both.

Eastern. Critical theories of literature in the Orient, however, have been more varied. There is an immense amount of highly technical, critical literature in India. Some works are recipe books, vast collections of tropes and stylistic devices; others are philosophical and general. In the best period of Indian literature, the cultural climax of Sanskrit (*c.* 320–490), it is assumed by writers that expressive and constructive factors are twin aspects of one reality. The same could be said of the Chinese, whose literary manuals and books on prosody and rhetoric are, as with the West, relegated to the class of technical handbooks, while their literary criticism is concerned rather with subjective, expressive factors—and so aligns itself with the pseudo-Longinus' "sublime." In Japan, technical, stylistic elements are certainly important (Japanese discrimination in these matters is perhaps the most refined in the world), but both writer and reader above all seek qualities of subtlety and poignancy and look for intimations

of profundity often so evanescent as to escape entirely the uninitiated reader.

Broad and narrow conceptions of poetry. Far Eastern literary tradition has raised the question of the broad and narrow definitions of poetry (a question familiar in the West from Edgar Allan Poe's advocacy of the short poem in his "Poetic Principle" [1850]). There are no long epic poems in Chinese, no verse novels of the sort written in England by Robert Browning or Alfred Lord Tennyson in the 19th century. In Chinese drama, apart from a very few of the songs, the verse as such is considered doggerel. The versified treatises on astronomy, agriculture, or fishing, of the sort written in Greek and Roman times and during the 18th century in the West, are almost unknown in the Far East. Chinese poetry is almost exclusively lyric, meditative, and elegiac, and rarely does any poem exceed 100 lines—most are little longer than Western sonnets; many are only quatrains. In Japan this tendency to limit length was carried even further. The ballad survives in folk poetry, as it did in China, but the "long poem" of very moderate length disappeared early from literature. For the Japanese, the tanka is a "long poem": in its common form it has 31 syllables; the *sedōka* has 38; the *dodoitsu,* imitating folk song, has 26. From the 17th century and onward, the most popular poetic form was the haiku, which has only 17 syllables.

This development is relevant to the West because it spotlights the ever-increasing emphasis which has been laid on intensity of communication, a characteristic of Western poetry (and of literature generally) as it has evolved since the late 19th century. In the Far East all cultivated people were supposed to be able to write suitable occasional poetry, and so those qualities that distinguished a poem from the mass consequently came to be valued above all others. Similarly, as modern readers in the West struggle with a "communication avalanche" of words, they seek in literature those forms, ideas, values, vicarious experiences, and styles that transcend the verbiage to be had on every hand.

Literary language. In some literatures (notably classical Chinese, Old Norse, Old Irish), the language employed is quite different from that spoken or used in ordinary writing. This marks off the reading of literature as a special experience. In the Western tradition, it is only in comparatively modern times that literature has been written in the common speech of cultivated men. The Elizabethans did not talk like Shakespeare nor 18th-century people in the stately prose of Samuel Johnson or Edward Gibbon (the so-called Augustan plain style in literature became popular in the late 17th century and flourished throughout the 18th, but it was really a special form of rhetoric with antecedent models in Greek and Latin). The first person to write major works of literature in the ordinary English language of the educated man was Daniel Defoe (1660?–1731), and it is remarkable how little the language has changed since. *Robinson Crusoe* (1719) is much more contemporary in tone than the elaborate prose of 19th-century writers like Thomas De Quincey or Walter Pater. (Defoe's language is not, in fact, so very simple: simplicity is itself one form of artifice.)

Ambiguity. Other writers have sought to use language for its most subtle and complex effects and have deliberately cultivated the ambiguity inherent in the multiple or shaded meanings of words. Between the two world wars, "ambiguity" became very fashionable in English and American poetry and the ferreting out of ambiguities—from even the simplest poem—was a favourite critical sport. T.S. Eliot in his literary essays is usually considered the founder of this movement. Actually, the platform of his critical attitudes is largely moral, but his two disciples, I.A. Richards in *Principles of Literary Criticism* (1924) and William Empson in *Seven Types of Ambiguity* (1930), carried his method to extreme lengths. The basic document of the movement is C.K. Ogden and I.A. Richards' *The Meaning of Meaning* (1923), a work of enormous importance in its time. Only a generation later, however, their ideas were somewhat at a discount.

Translation. Certainly, William Blake or Thomas Campion, when they were writing their simple lyrics, were unaware of the ambiguities and multiple meanings that future critics would find in them. Nevertheless, language is complex. Words do have overtones; they do stir up complicated reverberations in the mind that are ignored in their dictionary definitions. Great stylists, and most especially great poets, work with at least a half-conscious, or subliminal, awareness of the infinite potentialities of language. This is one reason why the essence of most poetry and great prose is so resistant to translation (quite apart from the radically different sound patterns that are created in other-language versions). The translator must project himself into the mind of the original author; he must transport himself into an entirely different world of relationships between sounds and meanings, and at the same time he must establish an equivalence between one infinitely complex system and another. Since no two languages are truly equivalent in anything except the simplest terms, this is a most difficult accomplishment. Certain writers are exceptionally difficult to translate. There are no satisfactory English versions, for example, of the Latin of Catullus, the French of Baudelaire, the Russian of Pushkin, or of the majority of Persian and Arabic poetry. The splendour of Sophocles' Greek, of Plato at his best, is barely suggested even in the finest English versions. On the other hand, the Germans insist that Shakespeare is better in German than he is in English, a humorous exaggeration perhaps. But again, Shakespeare is resistant to translation into French. His English seems to lack equivalents in that language.

The very greatest translations may become classics in their own right, of enduring literary excellence (the King James Version of the Bible, appearing in 1611, is an outstanding example), but on the whole the approximate equivalence of most translations to their originals seems to have a very short life. The original work remains the same, of lasting value to its own people, but the translation becomes out of date with each succeeding generation as the language and criteria of literary taste change. Nothing demonstrates the complexity of literary language more vividly. An analogous process takes place when a reader experiences a literary work in his own language; each generation gets a "new version" from its own classics.

Yet the values of great literature are more fundamental than complexity and subtleties of meaning arising from language alone. Works far removed from contemporary man in time and in cultural background, composed in a variety of languages utterly different from one another in structure, have nevertheless been translated successfully enough to be deeply moving. The 20th century has seen an immense mass of the oral literature of preliterate peoples and of the writings of all the great civilizations translated into modern languages. Understanding the growth of literature and its forms in other civilizations has greatly enriched the understanding of our own.

Craftsmanship. *Prosody.* Literature, like music, is an art of time, or "tempo": it takes time to read or listen to, and it usually presents events or the development of ideas or the succession of images or all these together in time. The craft of literature, indeed, can be said to be in part the manipulation of a structure in time, and so the simplest element of marking time, rhythm, is therefore of basic importance in both poetry and prose. Prosody, which is the science of versification, has for its subject the materials of poetry and is concerned almost entirely with the laws of metre, or rhythm in the narrowest sense. It deals with the patterning of sound in time; the number, length, accent, and pitch of syllables; and the modifications of rhythm by vowels and consonants. In most poetry, certain basic rhythms are repeated with modifications (that is to say, the poem rhymes or scans or both) but not in all. It most obviously does neither in the case of the "free forms" of modern poetry; but neither does it in the entire poetry of whole cultures. Since lyric poetry is either the actual text of song or else is immediately derived from song, it is regular in structure nearly everywhere in the world, although the elements of patterning that go into producing its rhythm may vary. The most important of these elements in English poetry, for example, have been accent, grouping of syllables (called feet), number of syllables in the line,

Elements of prosody

and rhyme at the end of a line (and sometimes within it). Other elements such as pitch, resonance, repetition of vowels (assonance), repetition of consonants (alliteration), and breath pauses (cadence) have also been of great importance in distinguishing successful poetry from doggerel verse, but on the whole they are not as important as the former, and poets have not always been fully conscious of their use of them. Greek and Latin poetry was consciously patterned on the length of syllables (long or short) rather than on their accent; but all the considerations of "sound" (such as assonance and alliteration) entered into the aesthetically satisfactory structure of a poem. Similarly, both the French and Japanese were content simply to count the syllables in a line—but again, they also looked to all the "sound" elements.

The rhythms of prose are more complicated, though not necessarily more complex, than those of poetry. The rules of prose patterning are less fixed; patterns evolve and shift indefinitely and are seldom repeated except for special emphasis. So the analysis of prose rhythm is more difficult to make than, at least, the superficial analysis of poetry.

Structure. The craft of writing involves more than mere rules of prosody. The work's structure must be manipulated to attract the reader. First, the literary situation has to be established. The reader must be directly related to the work, placed in it—given enough information on who, what, when, or why—so that his attention is caught and held (or, on the other hand, he must be deliberately mystified, to the same end).

Aristotle gave a formula for dramatic structure that can be generalized to apply to most literature: presentation, development, complication, crisis, and resolution. Even lyric poems can possess plot in this sense, but by no means are all literary works so structured, nor does such structure ensure their merit—it can be safely said that westerns, detective stories, and cheap melodramas are more likely to follow strictly the rules of Aristotle's *Poetics* than are great novels. Nevertheless, the scheme does provide a norm from which there is infinite variation. Neoclassical dramatists and critics, especially in 17th-century France, derived from Aristotle what they called the unities of time, action, and place. This meant that the action of a play should not spread beyond the events of one day and, best of all, should be confined within the actual time of performance. Nor should the action move about too much from place to place—best only to go from indoors to outdoors and back. There should be only one plot line, which might be relieved by a subplot, usually comic. These three unities—of time, place, and action—do not occur in Aristotle and are certainly not observed in Classical Greek tragedy. They are an invention of Renaissance critics, some of whom went even further, insisting also on what might be called a unity of mood. To this day there are those who, working on this principle, object to Shakespeare's use of comic relief within the tragic action of his plays—to the porter in *Macbeth,* for instance, or the gravediggers in *Hamlet.*

Unities of time, place, and action

Assiduous critics have found elaborate architectural structures in quite diffuse works—including Miguel de Cervantes' *Don Quixote* (1605–15), Sterne's *Tristram Shandy* (1759–67), Casanova's *Icosameron* (1788; 1928). But their "discoveries" are too often put there after the event. Great early novels such as the Chinese *Dream of the Red Chamber* (1754; first published in English 1929) and the Japanese *Tale of Genji* (early 11th century) usually develop organically rather than according to geometrical formulas, one incident or image spinning off another. Probably the most tightly structured work, in the Neoclassicists' sense, is the Icelandic *Njál's saga.*

The 19th century was the golden age of the novel, and most of the more famous examples of the form were systematically plotted, even where the plot structure simply traced the growth in personality of an individual hero or heroine. This kind of novel, of which in their very diverse ways Stendhal's *The Red and the Black* (1830) and Dickens' *David Copperfield* (1850) are great examples, is known as *Bildungsroman.* Gustave Flaubert's *Madame Bovary* (1857) is as rigorously classicist in form as the 17th-century plays of Racine and Corneille, which were the high point of the French classical theatre, although Flaubert obeys laws more complex than those of the Aristotelians. Novels such as Tolstoy's *War and Peace* (1865–69), Dostoyevsky's *Brothers Karamazov* (1880), and the works of Balzac owe much of their power to their ability to overwhelm the reader with a massive sense of reality. The latter 19th and early 20th centuries witnessed an attack on old forms, but what the new writers evolved was simply a new architecture. A novel like James Joyce's *Ulysses* (1922), which takes place in a day and an evening, is one of the most highly structured ever written. Novelists such as Joseph Conrad, Ford Madox Ford, Virginia Woolf, and, to a lesser extent, Henry James developed a multiple-aspect narrative, sometimes by using time shifts and flashbacks and by writing from different points of view, sometimes by using the device (dating back to Classical Greek romances) of having one or more narrators as characters within the story. (This technique, which was first perfected in the verse novels of Robert Browning, in fact reached its most extreme development in the English language in poetry: in Ezra Pound's *Cantos,* T.S. Eliot's *The Waste Land,* William Carlos Williams' *Paterson,* and the many long poems influenced by them.)

Narrative devices in the novel

CONTENT OF LITERATURE

The word as symbol. The content of literature is as limitless as the desire of human beings to communicate with one another. The thousands of years, perhaps hundreds of thousands, since the human species first developed speech have seen built up the almost infinite systems of relationships called languages. A language is not just a collection of words in an unabridged dictionary but the individual and social possession of living human beings, an inexhaustible system of equivalents, of sounds to objects and to one another. Its most primitive elements are those words that express direct experiences of objective reality, and its most sophisticated are concepts on a high level of abstraction. Words are not only equivalent to things, they have varying degrees of equivalence to one another. A symbol, says the dictionary, is something that stands for something else or a sign used to represent something, "as the lion is the symbol of courage, the cross the symbol of Christianity." In this sense all words can be called symbols, but the examples given—the lion and the cross—are really metaphors: that is, symbols that represent a complex of other symbols, and which are generally negotiable in a given society (just as money is a symbol for goods or labour). Eventually a language comes to be, among other things, a huge sea of implicit metaphors, an endless web of interrelated symbols. As literature, especially poetry, grows more and more sophisticated, it begins to manipulate this field of suspended metaphors as a material in itself, often as an end in itself. Thus, there emerge forms of poetry (and prose, too) with endless ramifications of reference, as in Japanese waka and haiku, some ancient Irish and Norse verse, and much of the poetry written in western Europe since the time of Baudelaire that is called modernist. It might be supposed that, at its most extreme, this development would be objective, constructive—aligning it with the critical theories stemming from Aristotle's *Poetics.* On the contrary, it is romantic, subjective art, primarily because the writer handles such material instinctively and subjectively, approaches it as the "collective unconscious," to use the term of the psychologist Carl Jung, rather than with deliberate rationality.

Themes and their sources. By the time literature appears in the development of a culture, the society has already come to share a whole system of stereotypes and archetypes: major symbols standing for the fundamental realities of the human condition, including the kind of symbolic realities that are enshrined in religion and myth. Literature may use such symbols directly, but all great works of literary art are, as it were, original and unique myths. The world's great classics evoke and organize the archetypes of universal human experience. This does not mean, however, that all literature is an endless repetition of a few myths and motives, endlessly retelling the first stories of civilized man, repeating the Sumerian *Epic of Gilgamesh* or Sophocles' *Oedipus the King.* The subject matter of literature is as wide as human experience it-

Use of symbols and myths in literature

self. Myths, legends, and folktales lie at the beginning of literature, and their plots, situations, and allegorical (metaphorical narrative) judgments of life represent a constant source of literary inspiration that never fails. This is so because mankind is constant—people share a common physiology. Even social structures, after the development of cities, remain much alike. Whole civilizations have a life pattern that repeats itself through history. Jung's term "collective unconscious" really means that mankind is one species, with a common fund of general experience. Egyptian scribes, Japanese bureaucrats, and junior executives in New York City live and respond to life in the same ways; the lives of farmers or miners or hunters vary only within narrow limits. Love is love and death is death, for a South African Bushman and a French Surrealist alike. So the themes of literature have at once an infinite variety and an abiding constancy. They can be taken from myth, from history, or from contemporary occurrence, or they can be pure invention (but even if they are invented, they are nonetheless constructed from the constant materials of real experience, no matter how fantastic the invention).

The writer's personal involvement. As time goes on, literature tends to concern itself more and more with the interior meanings of its narrative, with problems of human personality and human relationships. Many novels are fictional, psychological biographies which tell of the slowly achieved integration of the hero's personality or of his disintegration, of the conflict between self-realization and the flow of events and the demands of other people. This can be presented explicitly, where the characters talk about what is going on in their heads, either ambiguously and with reserve, as in the novels of Henry James, or overtly, as in those of Dostoyevsky. Alternatively, it can be presented by a careful arrangement of objective facts, where psychological development is described purely in terms of behaviour and where the reader's subjective response is elicited by the minute descriptions of physical reality, as in the novels of Stendhal and the greatest Chinese novels like the *Dream of the Red Chamber,* which convince the reader that through the novel he is seeing reality itself, rather than an artfully contrived semblance of reality.

Presentation of characters

Literature, however, is not solely concerned with the concrete, with objective reality, with individual psychology, or with subjective emotion. Some deal with abstract ideas or philosophical conceptions. Much purely abstract writing is considered literature only in the widest sense of the term, and the philosophical works that are ranked as great literature are usually presented with more or less of a sensuous garment. Thus, Plato's *Dialogues* rank as great literature because the philosophical material is presented in dramatic form, as the dialectical outcome of the interchange of ideas between clearly drawn, vital personalities, and because the descriptive passages are of great lyric beauty. Karl Marx's *Das Kapital* (1867–95) approaches great literature in certain passages in which he expresses the social passion he shares with the Hebrew prophets of the Old Testament. Euclid's *Elements* and St. Thomas Aquinas' *Summa theologica* give literary, aesthetic satisfaction to some people because of their purity of style and beauty of architectonic construction. In short, most philosophical works that rank as great literature do so because they are intensely human. The reader responds to Pascal's *Pensées,* to Montaigne's *Essays,* and to Marcus Aurelius' *Meditations* as he would to living men. Sometimes the pretense of purely abstract intellectual rigour is in fact a literary device. The writings of the 20th-century philosopher Ludwig Wittgenstein, for example, owed much of their impact to this approach, while the poetry of Paul Valéry borrows the language of philosophy and science for its rhetorical and evocative power.

Relation of form to content. Throughout literary history, many great critics have pointed out that it is artificial to make a distinction between form and content, except for purposes of analytical discussion. Form determines content. Content determines form. The issue is, indeed, usually only raised at all by those critics who are more interested in politics, religion, or ideology than in literature; thus, they object to writers who they feel sacrifice ideological orthodoxy for formal perfection, message for style.

Style. But style cannot really be said to exist on paper at all; it is the way the mind of the author expresses itself in words. Since words represent ideas, there cannot be abstract literature unless a collection of nonsense syllables can be admitted as literature. Even the most avant-garde writers associated with the Cubist or nonobjective painters used language, and language is meaning, though the meaning may be incomprehensible. Oscar Wilde and Walter Pater, the great 19th-century exponents of "art for art's sake," were in fact tireless propagandists for their views, which dominate their most flowery prose. It is true that great style depends on the perfect matching of content and form, so that the literary expression perfectly reflects the writer's intention; "poor style" reveals the inability of a writer to match the two—in other words, reveals his inability to express himself. This is why we say that "style expresses the man." The veiled style of Henry James, with its subtleties, equivocations, and qualifications, perfectly reflects his complicated and subtle mind and his abiding awareness of ambiguity in human motives. At the other extreme, the style of the early 20th-century American novelist Theodore Dreiser—bumbling, clumsy, dogged, troubled—perfectly embodies his own attitudes toward life and is, in fact, his constant judgment of his subject matter. Sometimes an author, under the impression that he is simply polishing his style, may completely alter his content. As Flaubert worked over the drafts of *Madame Bovary,* seeking always the apposite word that would precisely convey his meaning, he lifted his novel from a level of sentimental romance to make it one of the great ironic tragedies of literature. Yet, to judge from his correspondence, he seems never to have been completely aware of what he had done, of the severity of his own irony.

Coordination of content and form in good style

Literature may be an art, but writing is a craft, and a craft must be learned. Talent, special ability in the arts, may appear at an early age; the special personality called genius may indeed be born, not made. But skill in matching intention and expression comes with practice. Naïve writers, "naturals" like the 17th-century English diarist Samuel Pepys, the late 18th-century French naïf Restif de la Bretonne, the 20th-century American novelist Henry Miller, are all deservedly called stylists, although their styles are far removed from the deliberate, painstaking practice of a Flaubert or a Turgenev. They wrote spontaneously whatever came into their heads; but they wrote constantly, voluminously, and were, by their own standards, skilled practitioners.

Objective-subjective expression. There are certain forms of literature that do not permit such highly personal behaviour—for instance, formal lyric poetry and classic drama. In these cases the word "form" is used to mean a predetermined structure within whose mold the content must be fitted. These structures are, however, quite simple and so cannot be said to determine the content. Racine and Corneille were contemporaries; both were Neoclassic French dramatists; both abided by all the artificial rules—usually observing the "unities" and following the same strict rules of prosody. Yet their plays, and the poetry in which they are written, differ completely. Corneille is intellectually and emotionally a Neoclassicist—clear and hard, a true objectivist, sure of both his verse and the motivations of his characters. Racine was a great romantic long before the age of Romanticism. His characters are confused and tortured; his verse throbs like the heartbeats of his desperate heroines. He is a great sentimentalist in the best and deepest meaning of that word. His later influence on poets like Baudelaire and Paul Valéry is due to his mastery of sentimental expression, not, as they supposed, to his mastery of Neoclassic form.

Predetermined structure of classic drama

Verse on any subject matter can of course be written purely according to formula. The 18th century in England saw all sorts of prose treatises cast in rhyme and metre, but this was simply applied patterning. (Works such as *The Botanic Garden* [2 vol., 1794–95] by Erasmus Darwin should be sharply distinguished from James Thomson's *The Seasons* [1726–30], which is true poetry, not versified natural history—just as Virgil's *Georgics* is not an agricultural handbook.) Neoclassicism, especially in its 18th-century developments, confused—for ordinary minds, at

any rate—formula with form and so led to the revolt called Romanticism. The leading theorists of that revolt, the poets William Wordsworth and Samuel Taylor Coleridge, in the "Preface" (1800) to *Lyrical Ballads* urged the observance of a few simple rules basic to all great poetry and demanded a return to the integrity of expressive form. A similar revolution in taste was taking place all over Europe and also in China (where the narrow pursuit of formula had almost destroyed poetry). The Romantic taste could enjoy the "formlessness" of William Blake's prophetic books, or Walt Whitman's *Leaves of Grass*, or the loose imagination of Shelley—but careful study reveals that these writers were not formless at all. Each had his own personal form.

Time passes and the pendulum of taste swings. In the mid-20th century, Paul Valéry, T.S. Eliot, and Yvor Winters would attack what the latter called "the fallacy of expressive form," but this is itself a fallacy. All form in literature is expressive. All expression has its own form, even when the form is a deliberate quest of formlessness. (The automatic writing cultivated by the surrealists, for instance, suffers from the excessive formalism of the unconscious mind and is far more stereotyped than the poetry of the Neoclassicist Alexander Pope.) Form simply refers to organization, and critics who attack form do not seem always to remember that a writer organizes more than words. He organizes experience. Thus, his organization stretches far back in his mental process. Form is the other face of content, the outward, visible sign of inner spiritual reality.

Form and formlessness in modern literature

LITERATURE AND ITS AUDIENCE

Folk and elite literatures. In preliterate societies oral literature was widely shared; it saturated the society and was as much a part of living as food, clothing, shelter, or religion. In barbaric societies, the minstrel might be a courtier of the king or chieftain, and the poet who composed liturgies might be a priest. But the oral performance itself was accessible to the whole community. As society evolved its various social layers, or classes, an "elite" literature began to be distinguishable from the "folk" literature of the people. With the invention of writing this separation was accelerated until finally literature was being experienced individually by the elite (reading a book), while folklore and folk song were experienced orally and more or less collectively by the illiterate common people.

Elite literature continuously refreshes itself with materials drawn from the popular. Almost all poetic revivals, for instance, include in their programs a new appreciation of folk song, together with a demand for greater objectivity. On the other hand folk literature borrows themes and, very rarely, patterns from elite literature. Many of the English and Scottish ballads that date from the end of the Middle Ages and have been preserved by oral tradition share plots and even turns of phrase with written literature. A very large percentage of these ballads contain elements that are common to folk ballads from all over western Europe; central themes of folklore, indeed, are found all over the world. Whether these common elements are the result of diffusion is a matter for dispute. They do, however, represent great psychological constants, archetypes of experience common to the human species, and so these constants are used again and again by elite literature as it discovers them in folklore.

Modern popular literature. There is a marked difference between true popular literature, that of folklore and folk song, and the popular literature of modern times. Popular literature today is produced either to be read by a literate audience or to be enacted on television or in the cinema; it is produced by writers who are members, however lowly, of an elite corps of professional literates. Thus, popular literature no longer springs from the people; it is handed to them. Their role is passive. At the best they are permitted a limited selectivity as consumers.

Certain theorists once believed that folk songs and even long, narrative ballads were produced collectively, as has been said in mockery "by the tribe sitting around the fire and grunting in unison." This idea is very much out of date. Folk songs and folk tales began somewhere in one human mind. They were developed and shaped into the forms in which they are now found by hundreds of other minds as they were passed down through the centuries. Only in this sense were they "collectively" produced. During the 20th century, folklore and folk speech have had a great influence on elite literature—on writers as different as Franz Kafka and Carl Sandburg, Selma Lagerlöf and Kawabata Yasunari, Martin Buber and Isaac Bashevis Singer. Folk song has always been popular with bohemian intellectuals, especially political radicals (who certainly are an elite). Since World War II the influence of folk song upon popular song has not just been great; it has been determinative. Almost all "hit" songs since the mid-century have been imitation folk songs; and some authentic folk singers attract immense audiences.

Influence of folklore on modern literature

Popular fiction and drama, westerns and detective stories, films and television serials, all deal with the same great archetypal themes as folktales and ballads, though this is seldom due to direct influence; these are simply the limits within which the human mind works. The number of people who have elevated the formulas of popular fiction to a higher literary level is surprisingly small. Examples are H.G. Wells's early science fiction, the western stories of Gordon Young and Ernest Haycox, the detective stories of Sir Arthur Conan Doyle, Georges Simenon, and Raymond Chandler.

The latter half of the 20th century has seen an even greater change in popular literature. Writing is a static medium; that is to say, a book is read by one person at a time; it permits recollection and anticipation; the reader can go back to check a point or move ahead to find out how the story ends. In radio, television, and the cinema the medium is fluent; the audience is a collectivity and is at the mercy of time. It cannot pause to reflect or to understand more fully without missing another part of the action, nor can it go back or forward. Marshall McLuhan in his book *Understanding Media* (1964) became famous for erecting a whole structure of aesthetic, sociological, and philosophical theory upon this fact. But it remains to be seen whether the new, fluent materials of communication are going to make so very many changes in civilization, let alone in the human mind—mankind has, after all, been influenced for thousands of years by the popular, fluent arts of music and drama. Even the most transitory television serial was written down before it was performed, and the script can be consulted in the files. Before the invention of writing, all literature was fluent because it was contained in people's memory. In a sense it was more fluent than music, because it was harder to remember. Man in mass society becomes increasingly a creature of the moment, but the reasons for this are undoubtedly more fundamental than his forms of entertainment.

LITERATURE AND ITS ENVIRONMENT

Social and economic conditions. Literature, like all other human activities, necessarily reflects current social and economic conditions. Class stratification was reflected in literature as soon as it had appeared in life. Among the American Indians, for instance, the chants of the shaman, or medicine man, differ from the secret, personal songs of the individual, and these likewise differ from the group songs of ritual or entertainment sung in community. In the Heroic Age, the epic tales of kings and chiefs that were sung or told in their barbaric courts differed from the folktales that were told in peasant cottages.

Reflection of class distinction in literature

The more cohesive a society, the more the elements—and even attitudes—evolved in the different class strata are interchangeable at all levels. In the tight clan organization that existed in late medieval times at the Scottish border, for example, heroic ballads telling of the deeds of lords and ladies were preserved in the songs of the common people. But where class divisions are unbridgeable, elite literature is liable to be totally separated from popular culture. An extreme example is the classic literature of the Roman Empire. Its forms and its sources were largely Greek—it even adopted its laws of verse patterning from Greek models, even though these were antagonistic to the natural patterns of the Latin language—and most of the sophisticated works of the major Latin authors were com-

pletely closed to the overwhelming majority of people of the Roman Empire.

Printing has made all the difference in the negotiability of ideas. The writings of the 18th-century French writers Voltaire, Rousseau, and Diderot were produced from and for almost as narrow a caste as the Roman elite, but they were printed. Within a generation they had penetrated the entire society and were of vital importance in revolutionizing it.

Class distinctions in the literature of modern times exist more in the works themselves than in their audience. Although Henry James wrote about the upper classes and Émile Zola about workingmen, both were, in fact, members of an elite and were read by members of an elite—moreover, in their day, those who read Zola certainly considered themselves more of an elite than did the readers of Henry James. The ordinary people, if they read at all, preferred sentimental romances and "penny dreadfuls." Popular literature had already become commercially produced entertainment literature, a type which today is also provided by television scripts.

The elite who read serious literature are not necessarily members of a social or economic upper class. It has been said of the most ethereal French poet, Stéphane Mallarmé, that in every French small town there was a youth who carried his poems in his heart. These poems are perhaps the most "elite" product of western European civilization, but the "youths" referred to were hardly the sons of dukes or millionaires. (It is a curious phenomenon that, since the middle of the 18th century in Europe and in the United States, the majority of readers of serious literature—as well as of entertainment literature—have been women. The extent of the influence that this audience has exerted on literature itself must be immense.)

Hippolyte Taine's ecological theory of literature

National and group literature. Hippolyte Taine, the 19th-century French critic, evolved an ecological theory of literature. He looked first and foremost to the national characteristics of western European literatures, and he found the source of these characteristics in the climate and soil of each respective nation. His *History of English Literature* (5 vol., 1863–69) is an extensive elaboration of these ideas. It is doubtful that anyone today would agree with the simplistic terms in which Taine states his thesis. It is obvious that Russian literature differs from English or French from German. English books are written by Englishmen, their scenes are commonly laid in England, they are usually about Englishmen and they are designed to be read by Englishmen—at least in the first instance. But modern civilization becomes more and more a world civilization, wherein works of all peoples flow into a general fund of literature. It is not unusual to read a novel by a Japanese author one week and one by a black writer from West Africa the next. Writers are themselves affected by this cross-fertilization. Certainly, the work of the great 19th-century Russian novelists has had more influence on 20th-century American writers than has the work of their own literary ancestors. Poetry does not circulate so readily, because catching its true significance in translation is so very difficult to accomplish. Nevertheless, for the past 100 years or so, the influence of French poetry upon all the literatures of the civilized world has not just been important, it has been preeminent. The tendentious elements of literature—propaganda for race, nation, or religion—have been more and more eroded in this process of wholesale cultural exchange.

Popular literature on the other hand is habitually tendentious both deliberately and unconsciously. It reflects and stimulates the prejudices and parochialism of its audience. Most of the literary conflicts that have seized the totalitarian countries during the 20th century stem directly from relentless efforts by the state to reduce elite literature to the level of the popular. The great proletarian novels of our time have been produced, not by Russians, but by American blacks, Japanese, Germans, and—most proletarian of all—a German-American living in Mexico, B. Traven. Government control and censorship can inhibit literary development, perhaps deform it a little, and can destroy authors outright; but, whether in the France of Louis XIV or in the Soviet Union of the 20th century, it cannot be said to have a fundamental effect upon the course of literature.

Effect of censorship on literary development

The writer's position in society. A distinguishing characteristic of modern literature is the peculiar elite which it has itself evolved. In earlier cultures the artist, though he may have been neurotic at times, thought of himself as part of his society and shared its values and attitudes. Usually the clerkly caste played a personal, important role in society. In the modern industrial civilization, however, "scribes" became simply a category of skilled hired hands. The writer shared few of the values of the merchant or the entrepreneur or manager. And so the literary and artistic world came to have a subculture of its own. The antagonism between the two resultant sets of values is the source of what we call alienation—among the intellectuals at least (the alienation of the common man in urban, industrial civilization from his work, from himself, and from his fellows is another matter, although its results are reflected and intensified in the alienation of the elite). For about 200 years now, the artistic environment of the writer has not usually been shared with the general populace. The subculture known as bohemia and the literary and artistic movements generated in its little special society have often been more important—at least in the minds of many writers—than the historical, social, and economic movements of the culture as a whole. Even massive historical change is translated into these terms—the Russian Revolution, for instance, into Communist-Futurism, Constructivism, Socialist Realism. Western European literature could be viewed as a parade of movements—Romanticism, Realism, Naturalism, Futurism, Structuralism, and so on indefinitely. Some of the more journalistic critics, indeed, have delighted to regard it in such a way. But after the manifestos have been swept away, the meetings adjourned, the literary cafés of the moment lost their popularity, the turmoil is seen not to have made so very much difference. The Romantic Théophile Gautier (1811–72) and the Naturalist Émile Zola (1840–1902) have more in common than they have differences, and their differences are rather because of changes in society as a whole than because of conflicting literary principles.

Literary subcultures and movements

At first, changes in literary values are appreciated only at the upper levels of the literary elite itself, but often, within a generation, works once thought esoteric are being taught as part of a school syllabus. Most cultivated people once thought James Joyce's *Ulysses* incomprehensible or, where it was not, obscene. Today his methods and subject matter are commonplace in the commercial fiction of the mass culture. A few writers remain confined to the elite. Mallarmé is a good example—but he would have been just as ethereal had he written in the simplest French of direct communication. His subtleties are ultimately grounded in his personality.

Literature and the other arts. Literature has an obvious kinship with the other arts. Presented, a play is drama; read, a play is literature. Most important films have been based upon written literature, usually novels, although all the great epics and most of the great plays have been filmed at some time and thus have stimulated the younger medium's growth. Conversely, the techniques required in writing for film have influenced many writers in structuring their novels and have affected their style. Most popular fiction is written with "movie rights" in mind, and these are certainly a consideration with most modern publishers. Literature provides the libretto for operas, the theme for tone poems—even so anomalous a form as Nietzsche's *Thus Spake Zarathustra* was interpreted in music by Richard Strauss—and of course it provides the lyrics of songs. Many ballets and modern dances are based on stories or poems. Sometimes, music and dance are accompanied by a text read by a speaker or chanted by a chorus. The mid-19th century was the heyday of literary, historical, and anecdotal painting, though, aside from the Surrealists, this sort of thing died out in the 20th century. Cross-fertilization of literature and the arts now takes place more subtly, mostly in the use of parallel techniques—the rational dissociation of the Cubists or the spontaneous action painting of the Abstract Expressionists, for example, which flourished at the same time as

the free-flowing uncorrected narratives of some novelists in the 1950s and '60s.

LITERATURE AS A COLLECTION OF GENRES

Critics have invented a variety of systems for treating literature as a collection of genres. Often these genres are artificial, invented after the fact with the aim of making literature less sprawling, more tidy. Theories of literature must be based upon direct experience of the living texts and so be flexible enough to contain their individuality and variety. Perhaps the best approach is historical, or genetic. What actually happened, and in what way did literature evolve up to the present day?

Oral literature

There is a surprising variety of oral literature among surviving preliterate peoples, and, as the written word emerges in history, the indications are that the important literary genres all existed at the beginning of civilized societies: heroic epic; songs in praise of priests and kings; stories of mystery and the supernatural; love lyrics; personal songs (the result of intense meditation); love stories; tales of adventure and heroism (of common peoples, as distinct from the heroic epics of the upper classes); satire (which was dreaded by barbaric chieftains); satirical combats (in which two poets or two personifications abused one another and praised themselves); ballads and folktales of tragedy and murder; folk stories, such as the tale of the clever boy who performs impossible tasks, outwits all his adversaries, and usually wins the hand of the king's daughter; animal fables like those attributed to Aesop (the special delight of Black Africa and Indian America); riddles, proverbs, and philosophical observations; hymns, incantations, and mysterious songs of priests; and finally actual mythology—stories of the origin of the world and the human race, of the great dead, and of the gods and demigods.

Epic. The true heroic epic never evolved far from its preliterate origins, and it arose only in the Heroic Age which preceded a settled civilization. The conditions reflected in, say, the *Iliad* and *Odyssey* are much the same as those of the Anglo-Saxon *Beowulf,* the German *Nibelungenlied,* or the Irish stories of Cú Chulainn. The literary epic is another matter altogether. Virgil's *Aeneid,* for instance, or Milton's *Paradise Lost* are products of highly sophisticated literary cultures. Many long poems sometimes classified as epic literature are no such thing—Dante's *La divina commedia* (*The Divine Comedy*), for example, is a long theological, philosophical, political, moral, and mystical poem. Dante considered it to be a kind of drama which obeyed the rules of Aristotle's *Poetics.* Goethe's *Faust* is in dramatic form and is sometimes even staged—but it is really a philosophical poetic novel. Modern critics have described long poems such as T.S. Eliot's *Waste Land* and Ezra Pound's *Cantos* as "philosophical epics." There is nothing epic about them; they are reveries, more or less philosophical.

Lyric poetry. Lyric poetry never gets far from its origins, except that some of its finest examples—Medieval Latin, Provençal, Middle High German, Middle French, Renaissance—which today are only read, were actually written to be sung. In the 20th century, however, popular songs of great literary merit have become increasingly common—for example, the songs of Bertolt Brecht and Kurt Weill in German, of Georges Brassens and Anne Sylvestre in French, and of Leonard Cohen, Bob Dylan, and Joni Mitchell. It is interesting to note that, in periods when the culture values artificiality, the lyric becomes stereotyped. Then, after a while, the poets revolt and, usually turning to folk origins, restore to lyric poetry at least the appearance of naturalness and spontaneity.

Diverse forms of satire

Satire. The forms of satire are as manifold as those of literature itself—from those of the mock epic to the biting epigram. A great many social and political novels of today would have been regarded as satire by the ancients. Many of the great works of all time are satires, but in each case they have risen far above their immediate satirical objectives. The 16th-century medieval satire on civilization, the *Gargantua and Pantagruel* of Rabelais, grew under the hand of its author into a great archetypal myth of the lust for life. Cervantes' *Don Quixote,* often called the greatest work of prose fiction in the West, is superficially a satire of the sentimental romance of knightly adventure. But, again, it is an archetypal myth, telling the adventures of the soul of man—of the individual—in the long struggle with what is called the human condition. *The Tale of Genji* by Murasaki Shikibu has sometimes been considered by obtuse critics as no more than a satire on the sexual promiscuity of the Heian court. In fact, it is a profoundly philosophical, religious, and mystical novel.

Prose fiction. Extended prose fiction is the latest of the literary forms to develop. We have romances from classical Greek times that are as long as short novels; but they are really tales of adventure—vastly extended anecdotes. The first prose fiction of any psychological depth is the *Satyricon,* almost certainly attributed to Petronius Arbiter (died AD 65/66). Though it survives only in fragments, supposedly one-eleventh of the whole, even these would indicate that it is one of the greatest picaresque novels, composed of loosely connected episodes of robust and often erotic adventure. The other great surviving fiction of classical times is the *Metamorphoses* (known as *The Golden Ass*) by Apuleius (2nd century AD). In addition to being a picaresque adventure story, it is a criticism of Roman society, a celebration of the religion of Isis, and an allegory of the progress of the soul. It contains the justly celebrated story of Cupid and Psyche, a myth retold with psychological subtlety. Style has much to do with the value and hence the survival of these two works. They are written in prose of extraordinary beauty, although it is by no means of "classical" purity. The prose romances of the Middle Ages are closely related to earlier heroic literature. Some, like Sir Thomas Malory's 15th-century *Le Morte Darthur,* are retellings of heroic legend in terms of the romantic chivalry of the early Renaissance, a combination of barbaric, medieval, and Renaissance sensibility which, in the tales of Tristram and Iseult and Launcelot and Guinevere, produced something not unlike modern novels of tragic love.

The earliest prose fiction

The Western novel is a product of modern civilization, although in the Far East novels began a separate development as early as the 10th century. Extended prose works of complex interpersonal relations and motivations begin in 17th-century France with *The Princess of Cleves* (1678) by Madame de La Fayette. Eighteenth-century France produced an immense number of novels dealing with love analysis but none to compare with Madame de La Fayette's until Pierre Choderlos de Laclos wrote *Les Liaisons dangereuses* (1782). This was, in form, an exchange of letters between two corrupters of youth; but, in intent, it was a savage satire of the *ancien régime* and a heart-rending psychological study. The English novel of the 18th century was less subtle, more robust—vulgar in the best sense—and is exemplified by Henry Fielding's *Tom Jones* (1749) and Laurence Sterne's *Tristram Shandy.* The 19th century was the golden age of the novel. It became ever more profound, complex, and subtle (or, on the other hand, more popular, eventful, and sentimental). By the beginning of the 20th century it had become the most common form of thoughtful reading matter and had replaced, for most educated people, religious, philosophical, and scientific works as a medium for the interpretation of life. By the late 1920s the novel had begun to show signs of decay as a form, and no works have since been produced to compare with the recent past. This may prove to be a temporarily barren period, or else the novel may be losing its energy as a narrative art form and in this sense giving way to the medium of film.

Current state of the novel

Drama. Like lyric poetry, drama has been an exceptionally stable literary form. Given a little leeway, most plays written by the beginning of the 20th century could be adjusted to the rules of Aristotle's *Poetics.* Before World War I, however, all traditional art forms, led by painting, began to disintegrate, and new forms evolved to take their place. In drama the most radical innovator was August Strindberg (1849–1912), and from that day to this, drama (forced to compete with the cinema) has become ever more experimental, constantly striving for new methods, materials, and, especially, ways to establish a close relationship with the audience. All this activity has profoundly modified drama as literature.

Future developments. In the 20th century the methods of poetry have also changed drastically, although the "innovator" here might be said to have been Baudelaire (1821–67). The disassociation and recombination of ideas of the Cubists, the free association of ideas of the Surrealists, dreams, trance states, the poetry of preliterate people—all have been absorbed into the practice of modern poetry. This proliferation of form is not likely to end. Effort that once was applied to perfecting a single pattern in a single form may in the future be more and more directed toward the elaboration of entirely new "multimedia" forms, employing the resources of all the established arts. At the same time, writers may prefer to simplify and polish the forms of the past with a rigorous, Neoclassicist discipline. In a worldwide urban civilization, which has taken to itself the styles and discoveries of all cultures past and present, the future of literature is quite impossible to determine.

WRITINGS ON LITERATURE

Scholarly research. Research by scholars into the literary past began almost as soon as literature itself—as soon as the documents accumulated—and for many centuries it represents almost all the scholarship that has survived. The most extensive text of the Sumerian *Epic of Gilgamesh,* the first of the world's great classics, is a late Assyrian synthesis that must have required an immense amount of research into clay tablets, written in several languages going back to the beginning of Mesopotamian civilization. Many Egyptian poems and the philosophic creation myth known as the "Memphite Theology" survive in very late texts that carefully reproduce the original language of the first dynasties. Once the function of the scribe was established as essential, he invented literary scholarship, both to secure his position and to occupy his leisure. The great epoch of literary scholarship in ancient times centred on the library (and university) of Alexandria from its foundation in 324 BC to its destruction by the Arabs in AD 640. Hellenistic Greek scholars there developed such an academic and pedantic approach to literary scholarship and scholarly literature that the term Alexandrine remains pejorative to this day. To them, however, is owed the survival of the texts of most of the Greek classics. Roman literary scholarship was rhetorical rather than analytic. With the coming of Islām, there was established across the whole warm temperate zone of the Old World a far-flung community of scholars who were at home in learned circles from India to Spain. Judaism, like Islām, was a religion of the book and of written tradition, so literary scholarship played a central role in each. The same is true of India, China, and later Japan; for sheer bulk, as well as for subtlety and insight, Oriental scholarship has never been surpassed. In a sense, the Renaissance in Europe was a cultural revolution led by literary scholars who discovered, revived, and made relevant again the literary heritage of Greece and Rome. In the 19th century, literary scholarship was dominated by the exhaustive, painstaking German academician, and that Germanic tradition passed to the universities of the United States. The demand that every teacher should write a master's thesis, a doctor's dissertation, and, for the rest of his career, publish with reasonable frequency learned articles and scholarly books, has led to a mass of scholarship of widely varying standards and value. Some is trivial and absurd, but the best has perfected the texts and thoroughly illuminated the significance of nearly all the world's great literature.

Ancient literary scholarship

Literary criticism. Literary criticism, as distinguished from scholarly research, is usually itself considered a form of literature. Some people find great critics as entertaining and stimulating as great poets, and theoretical treatises of literary aesthetics can be as exciting as novels. Aristotle, Longinus, and the Roman rhetorician and critic Quintilian are still read, although Renaissance critics like the once all-powerful Josephus Scaliger are forgotten by all but specialized scholars. Later critics, such as Poe, Sainte-Beuve, Taine, Vissarion Belinsky, Matthew Arnold, Walter Bagehot, Walter Pater, and George Saintsbury, are probably read more for themselves than for their literary judgments and for their general theorizing rather than for their applications (in the case of the first three, for instance, time has confounded almost all the evaluations they made of their contemporaries). The English critics have survived because they largely confined themselves to acknowledged masterpieces and general ideas. Perhaps literary criticism can really be read as a form of autobiography. Aestheticians of literature like I.A. Richards, Sir C.M. Bowra, Paul Valéry, Suzanne Langer, and Ernst Cassirer have had an influence beyond the narrow confines of literary scholarship and have played in our time something approaching the role of general philosophers. This has been true on the popular level as well. The Dane Georg Brandes, the Americans James Gibbons Huneker, H.L. Mencken, and Edmund Wilson—these men have been social forces in their day. Literary criticism can play its role in social change. In Japan, the overthrow of the shogunate, the restoration of the emperor, and the profound change in the Japanese social sensibility begins with the literary criticism of Motoori Norinaga (1730–1801). The 19th-century revolution in theology resulted from the convergence of Darwinian theories of evolution and the technical and historical criticism of the Bible that scholars had undertaken. For many modern intellectuals, the literary quarterlies and weeklies, with their tireless discussions of the spiritual significance and formal characteristics of everything from the greatest masterpiece to the most ephemeral current production, can be said to have filled the place of religion, both as rite and dogma. (K.Re.)

POETRY

The nature of poetry

Poetry is a vast subject, as old as history and older, present wherever religion is present, possibly—under some definitions—the primal and primary form of languages themselves. The present section means only to describe in as general a way as possible certain properties of poetry and of poetic thought regarded as in some sense independent modes of the mind. Naturally, not every tradition nor every local or individual variation can be—or need be—included, but the article illustrates by examples of poetry ranging between nursery rhyme and epic. (For particular information about various types of poetry, see below *Prosody, Ballad,* and *Epic.*)

ATTEMPTS TO DEFINE POETRY

Poetry is the other way of using language. Perhaps in some hypothetical beginning of things it was the only way of using language or simply was language *tout court,* prose being the derivative and younger rival. Both poetry and language are fashionably thought to have belonged to ritual in early agricultural societies; and poetry in particular, it has been claimed, arose at first in the form of magical spells recited to ensure a good harvest. Whatever the truth of this hypothesis, it blurs a useful distinction: by the time there begins to be a separate class of objects called poems, recognizable as such, these objects are no longer much regarded for their possible yam-growing properties, and such magic as they may be thought capable of has retired to do its business upon the human spirit and not directly upon the natural world outside.

Formally, poetry is recognizable by its greater dependence on at least one more parameter, the *line,* than appears in prose composition. This changes its appearance on the page; and it seems clear that people take their cue from this changed appearance, reading poetry aloud in a very different voice from their habitual voice, possibly because, as Ben Jonson said, poetry "speaketh somewhat above a mortal mouth." If, as a test of this description, people are shown poems printed as prose, it most often turns out that they will read the result as prose simply because it looks that way; which is to say that they are no longer

guided in their reading by the balance and shift of the line in relation to the breath as well as the syntax.

That is a minimal definition but perhaps not altogether uninformative. It may be all that ought to be attempted in the way of a definition: Poetry is the way it is because it looks that way, and it looks that way because it sounds that way and vice versa.

POETRY AND PROSE

People's reason for wanting a definition is to take care of the borderline case, and this is what a definition, as if by definition, will not do. That is, if a man asks for a definition of poetry, it will most certainly not be the case that he has never seen one of the objects called poems that are said to embody poetry; on the contrary, he is already tolerably certain what poetry in the main is, and his reason for wanting a definition is either that his certainty has been challenged by someone else or that he wants to take care of a possible or seeming exception to it: hence the perennial squabble about distinguishing poetry from prose, which is rather like distinguishing rain from snow—everyone is reasonably capable of doing so, and yet there are some weathers that are either-neither.

Distinguishing prose from poetry

Sensible things have been said on the question. The poet T.S. Eliot suggested that part of the difficulty lies in the fact that there is the technical term "verse" to go with the term "poetry," while there is no equivalent technical term to distinguish the mechanical part of prose and make the relation symmetrical. The French poet Paul Valéry said that prose was walking, poetry dancing. Indeed, the original two terms, *prosus* and *versus*, meant, respectively, "going straight forth" and "returning"; and that distinction does point up the tendency of poetry to incremental repetition, variation, and the treatment of many matters and different themes in a single recurrent form such as couplet or stanza.

Robert Frost said shrewdly that poetry was what got left behind in translation, which suggests a criterion of almost scientific refinement: when in doubt, translate; whatever comes through is prose, the remainder is poetry. And yet to even so acute a definition the obvious exception is a startling and a formidable one: some of the greatest poetry in the world is in the Authorized Version of the Bible, which is not only a translation but also, as to its appearance in print, identifiable neither with verse nor with prose in English but rather with a cadence owing something to both.

There may be a better way of putting the question by the simple test alluded to above. When people are presented with a series of passages drawn indifferently from poems and stories but all printed as prose, they will show a dominant inclination to identify everything they possibly can as prose. This will be true, surprisingly enough, even if the poem rhymes and will often be true even if the poem in its original typographical arrangement would have been familiar to them. The reason seems to be absurdly plain: the reader recognizes poems by their appearance on the page, and he responds to the convention whereby he recognizes them by reading them aloud in a quite different tone of voice from that which he applies to prose (which, indeed, he scarcely reads aloud at all). It should be added that he makes this distinction also without reading aloud; even in silence he confers upon a piece of poetry an attention that differs from what he gives to prose in two ways especially: in tone and in pace.

In place of further worrying over definitions, it may be both a relief and an illumination to exhibit certain plain and mighty differences between prose and poetry by a comparison. In the following passages a prose writer and a poet are talking about the same subject, growing older.

> Between the ages of 30 and 90, the weight of our muscles falls by 30 percent and the power we can exert likewise . . . . The number of nerve fibres in a nerve trunk falls by a quarter. The weight of our brains falls from an average of 3.03 lb. to 2.27 lb. as cells die and are not replaced . . . . (Gordon Rattray Taylor, *The Biological Time Bomb*, 1968.)

> Let me disclose the gifts reserved for age
> To set a crown upon your lifetime's effort.
> First, the cold friction of expiring sense
> Without enchantment, offering no promise
> But bitter tastelessness of shadow fruit
> As body and soul begin to fall asunder.
> Second, the conscious impotence of rage
> At human folly, and the laceration
> Of laughter at what ceases to amuse.
> And last, the rending pain of re-enactment
> Of all that you have done, and been . . . .
> (T.S. Eliot, *Four Quartets*.)

Before objecting that a simple comparison cannot possibly cover all the possible ranges of poetry and prose compared, the reader should consider for a moment what differences are exhibited. The passages are oddly parallel, hence comparable, even in a formal sense; for both consist of the several items of a catalog under the general title of growing old. The significant differences are of tone, pace, and object of attention. If the prose passage interests itself in the neutral, material, measurable properties of the process, while the poetry interests itself in what the process will signify to someone going through it, that is not accidental but of the essence; if one reads the prose passage with an interest in being informed, noting the parallel constructions without being affected by them either in tone or in pace, while reading the poetry with a sense of considerable gravity and solemnity, that too is of the essence. One might say as tersely as possible that the difference between prose and poetry is most strikingly shown in the two uses of the verb "to fall":

Differences of tone, pace, and object of attention

> The number of nerve fibres in a nerve trunk falls by a quarter
> As body and soul begin to fall asunder

It should be specified here that the important differences exhibited by the comparison belong to the present age. In each period, speaking for poetry in English at any rate, the dividing line will be seen to come at a different place. In Elizabethan times the diction of prose was much closer to that of poetry than it later became, and in the 18th century authors saw nothing strange about writing in couplets about subjects that later would automatically and compulsorily belong to prose—for example, horticulture, botany, even dentistry. Here is not the place for entering into a discussion of so rich a chapter in the history of ideas; but it should be remarked that the changes involved in the relation between poetry and prose are powerfully influenced by the immense growth of science, commerce, and number in man's ways of describing, even of viewing, the world.

Returning to the comparison, it is observable that though the diction of the poem is well within what could be commanded by a moderately well-educated speaker, it is at the same time well outside the range of terms in fact employed by such a speaker in his daily occasions; it is a diction very conscious, as it were, of its power of choosing terms with an effect of peculiar precision and of combining the terms into phrases with the same effect of peculiar precision and also of combining sounds with the same effect of peculiar precision. Doubtless the precision of the prose passage is greater in the more obvious property of dealing in the measurable; but the poet attempts a precision with respect to what is not in the same sense measurable nor even in the same sense accessible to observation; the distinction is perhaps just that made by the French scientist and philosopher Blaise Pascal in discriminating the spirits of geometry and finesse; and if one speaks of "effects of precision" rather than of precision itself, that serves to distinguish one's sense that the art work is always somewhat removed from what people are pleased to call the real world, operating instead, in Immanuel Kant's shrewd formula, by exhibiting "purposefulness without purpose." To much the same point is what Samuel Taylor Coleridge remembers having learned from his schoolmaster:

Precision of poetic diction

> I learnt from him, that Poetry, even that of the loftiest and, seemingly, that of the wildest odes, had a logic of its own, as severe as that of science; and more difficult, because more subtle, more complex, and dependent on more, and more fugitive causes. In the truly great poets, he would say, there is a reason assignable, not only for every word, but for the position of every word. (*Biographia Literaria*, ch. I.)

Perhaps this is a somewhat exaggerated, as it is almost

always an unprovable, claim, illustrating also a propensity for competing with the prestige of science on something like its own terms—but the last remark in particular illuminates the same author's terser formulation: "prose = words in the best order, poetry = the best words in the best order." This attempt at definition, impeccable because uninformative, was derived from Jonathan Swift, who had said, also impeccably and uninformatively, that style in writing was "the best words in the best order." Which may be much to the same effect as Louis Armstrong's saying, on being asked to define jazz, "Baby, if you got to ask the question, you're never going to know the answer." Or the painter Marcel Duchamp's elegant remark on what psychologists call "the problem of perception": "If no solution, then maybe no problem?" This species of gnomic, riddling remark may be determinate for the artistic attitude toward definition of every sort; and its skepticism is not confined to definitions of poetry but extends to definitions of anything whatever, directing one not to dictionaries but to experience and, above all, to use: "Anyone with a watch can tell you what time it is," said Valéry, "but who can tell you what is time?"

Experiencing poetry

Happily, if poetry is almost impossible to define, it is extremely easy to recognize in experience; even untutored children are rarely in doubt about it when it appears:

> Little Jack Jingle,
> He used to live single,
> But when he got tired of this kind of life,
> He left off being single, and liv'd with his wife.

It might be objected that this little verse is not of sufficient import and weight to serve as an exemplar for poetry. It ought to be remembered, though, that it has given people pleasure so that they continued to say it until and after it was written down, nearly two centuries ago. The verse has survived, and its survival has something to do with pleasure, with delight; and while it still lives, how many more imposing works of language—epic poems, books of science, philosophy, theology—have gone down, deservedly or not, into dust and silence. It has, obviously, a form, an arrangement of sounds in relation to thoughts that somehow makes its agreeable nonsense closed, complete, and decisive. But this somewhat muddled matter of form deserves a heading and an instance all to itself.

FORM IN POETRY

People nowadays who speak of form in poetry almost always mean such externals as regular measure and rhyme, and most often they mean to get rid of these in favour of the freedom they suppose must follow upon the absence of form in this limited sense. But in fact a poem having only one form would be of doubtful interest even if it could exist. In this connection, the poet J.V. Cunningham speaks of "a convergence of forms, and forms of disparate orders," adding: "It is the coincidence of forms that locks in the poem." For a poem is composed of internal and intellectual forms as well as forms externally imposed and preexisting any particular instance, and these may be sufficient without regular measure and rhyme; if the intellectual forms are absent, as in greeting-card verse and advertising jingles, no amount of thumping and banging will supply the want.

Form, in effect, is like the doughnut that may be said to be nothing in a circle of something or something around nothing; it is either the outside of an inside, as when people speak of "good form" or "bourgeois formalism," or the inside of an outside, as in the scholastic saying that "the soul is the form of the body." Taking this principle, together with what Cunningham says of the matter, one may now look at a very short and very powerful poem with a view to distinguishing the forms, or schemes, of which it is made. It was written by Rudyard Kipling—a great poet at present somewhat sunken in reputation, probably on account of misinterpretations having to do more with his imputed politics than with his poetry—and its subject, one of a series of epitaphs for the dead of World War I, is a soldier shot by his comrades for cowardice in battle.

> I could not look on Death, which being known,
> Men led me to him, blindfold and alone.

The aim of the following observations and reflections is to distinguish as clearly as possible—distinguish without dividing—the feelings evoked by the subject, so grim, horrifying, tending to helpless sorrow and despair, from the feelings, which might better be thought of as meanings, evoked by careful contemplation of the poem in its manifold and somewhat subtle ways of handling the subject, leading the reader on to a view of the strange delight intrinsic to art, whose mirroring and shielding power allows him to contemplate the world's horrible realities without being turned to stone.

Kinds of poetic form

There is, first, the obvious external form of a rhymed, closed couplet in iambic pentameter (that is, five poetic "feet," each consisting of an unstressed followed by a stressed syllable, per line). There is, second, the obvious external form of a single sentence balanced in four grammatical units with and in counterpoint with the metrical form. There is, third, the conventional form belonging to the epitaph and reflecting back to antiquity; it is terse enough to be cut in stone and tight-lipped also, perhaps for other reasons, such as the speaker's shame. There is, fourth, the fictional form belonging to the epitaph, according to which the dead man is supposed to be saying the words himself. There is, fifth, especially poignant in this instance, the real form behind or within the fictional one, for the reader is aware that in reality it is not the dead man speaking, nor are his feelings the only ones the reader is receiving, but that the comrades who were forced to execute him may themselves have made up these two lines with their incalculably complex and exquisite balance of scorn, awe, guilt, and consideration even to tenderness for the dead soldier. There is, sixth, the metaphorical form, with its many resonances ranging from the tragic through the pathetic to irony and apology: dying in battle is spoken of in language relating it to a social occasion in drawing room or court; the coward's fear is implicitly represented as merely the timorousness and embarassment one might feel about being introduced to a somewhat superior and majestic person, so that the soldiers responsible for killing him are seen as sympathetically helping him through a difficult moment in the realm of manners. In addition, there is, seventh, a linguistic or syntactical form, with at least a couple of tricks to it: the second clause, with its reminiscence of Latin construction, participates in the meaning by conferring a Roman stoicism and archaic gravity on the saying; remembering that the soldiers in the poem had been British schoolboys not long before, the reader might hear the remote resonance of a whole lost world built upon Greek and Roman models; and the last epithets, "blindfold and alone," while in the literal acceptation they clearly refer to the coward, show a distinct tendency to waver over and apply mysteriously to Death as well, sitting there waiting "blindfold and alone." One might add another form, the eighth, composed of the balance of sounds, from the obvious likeness in the rhyme down to subtleties and refinements beneath the ability of coarse analysis to discriminate. And even there one would not be quite at an end; an overall principle remains, the compression of what might have been epic or five-act tragedy into two lines, or the poet's precise election of a single instant to carry what the novelist, if he did his business properly, would have been hundreds of pages arriving at.

The coincidence of poetic forms

It is not at all to be inferred that the poet composed his poem in the manner of the above laborious analysis of its strands; the whole insistence, rather, is that he did not catalog eight or 10 forms and assemble them into a poem; more likely it "just came to him." But the example may serve to indicate how many modes of the mind go together in this articulation of an implied drama and the tension among many possible sentiments that might arise in response to it.

In this way, by the coincidence of forms that locks in the poem, one may see how to answer a question that often arises about poems: though their thoughts are commonplace, they themselves mysteriously are not. One may answer on the basis of the example and the inferences produced from it that a poem is not so much a thought as it is a mind: talk with it, and it will talk back, telling you

many things that you might have thought for yourself but somehow didn't until it brought them together. Doubtless a poem is a much simplified model for the mind. But it might still be one of the best man has available. On this great theme, however, it will be best to proceed not by definition but by parable and interpretation.

POETRY AS A MODE OF THOUGHT: THE PROTEAN ENCOUNTER

In the fourth book of the *Odyssey* Homer tells the following strange tale. After the war at Troy, Menelaus wanted very much to get home but was held up in Egypt for want of a wind because, as he later told Telemachus, he had not sacrificed enough to the gods. "Ever jealous the Gods are," he said, "that we men mind their dues." But because the gods work both ways, it was on the advice of a goddess, Eidothea, that Menelaus went to consult Proteus, the old one of the sea, as one might consult a travel agency.

Proteus was not easy to consult. He was herding seals, and the seals stank even through the ambrosia Eidothea had provided. And when Menelaus crept up close, disguised as a seal, and grabbed him, Proteus turned into a lion, a dragon, a leopard, a boar, a film of water, and a high-branched tree. But Menelaus managed to hang on until Proteus gave up and was himself again; whereupon Menelaus asked him the one great question: How do I get home? And Proteus told him: You had better go back to Egypt and sacrifice to the gods some more.

This story may be taken as a parable about poetry. A man has an urgent question about his way in the world. He already knows the answer, but it fails to satisfy him. So at great inconvenience, hardship, and even peril, he consults a powerful and refractory spirit who tries to evade his question by turning into anything in the world. Then, when the spirit sees he cannot get free of the man, and only then, he answers the man's question, not simply with a commonplace but with the same commonplace the man had been dissatisfied with before. Satisfied or not, however, the man now obeys the advice given him.

A foolish story? All the same, it is to be observed that Menelaus did get home. And it was a heroic thing to have hung onto Proteus through those terrifying changes and compelled him to be himself and answer up. Nor does it matter in the least to the story that Menelaus personally may have been a disagreeable old fool as well as a cuckold.

A poet also has one great and simple question, simple though it may take many forms indeed. Geoffrey Chaucer put it as well as anyone could, and in three lines at that:

> What is this world? what asketh men to have?
> Now with his love, now in his colde grave,
> Allone, with-outen any companye.
>
> ("The Knight's Tale")

And a poet gets the simple answer he might expect, the one the world grudgingly gives to anyone who asks such a question: The world is this way, not that way, and you ask for more than you will be given, which the poet, being scarcely more fool than his fellowmen, knew already. But on the path from question to answer, hanging onto the slippery disguiser and shape-shifter Proteus, he will see many marvels; he will follow the metamorphoses of things in the metamorphoses of their phrases, and he will be so elated and ecstatic in this realm of wonders that the voice in which he speaks these things, down even to the stupid, obvious, and commonplace answer, will be to his hearers a solace and a happiness in the midst of sorrows:

> When I do count the clock that tells the time,
> And see the brave day sunk in hideous night;
> When I behold the violet past prime,
> And sable curls, all silver'd o'er with white;
> When lofty trees I see barren of leaves,
> Which erst from heat did canopy the herd,
> And summer's green all girded up in sheaves,
> Borne on the bier with white and bristly beard,
> Then of thy beauty do I question make,
> That thou among the wastes of time must go,
> Since sweets and beauties must themselves forsake
> And die as fast as they see others grow;
> And nothing 'gainst Time's scythe can make defence
> Save breed, to brave him when he takes thee hence.
>
> (Shakespeare, Sonnet 12.)

Like Menelaus, the poet asks a simple question, to which, moreover, he already knows the unsatisfying answer. Question and answer, one might say, have to be present, although of themselves they seem to do nothing much; but they assert the limits of a journey to be taken. They are the necessary but not sufficient conditions of what really seems to matter here, the Protean encounter itself, the grasping and hanging on to the powerful and refractory spirit in its slippery transformations of a single force flowing through clock, day, violet, graying hair, trees dropping their leaves, the harvest in which, by a peculiarly ceremonial transmutation, the grain man lives by is seen without contradiction as the corpse he comes to. As for the answer to the question, it is not surprising nor meant to be surprising; it is only just. The poetic question and answer

On this point—that the answer comes as no surprise—poets show an agreement that quite transcends the differences of periods and schools. Alexander Pope's formula, "What oft was thought, but ne'er so well expresst," sometimes considered as the epitome of a shallow and parochial decorum, is not in essence other than this offered by John Keats:

> I think Poetry should surprise by a fine excess, and not by Singularity—it should strike the Reader as a wording of his own highest thoughts, and appear almost a Remembrance. (Letter to John Taylor, 1818.)

In the present century, Robert Frost is strikingly in agreement:

> A word about recognition: In literature it is our business to give people the thing that will make them say, "Oh yes I know what you mean." It is never to tell them something they dont know, but something they know and hadnt thought of saying. It must be something they recognize. (Letter to John Bartlett, in *Modern Poetics*, ed. James Scully, 1965.)

And the poet and critic John Crowe Ransom gives the thought a cryptically and characteristically elegant variation: "Poetry is the kind of knowledge by which we must know that we have arranged that we shall not know otherwise." Perhaps this point about recognition might be carried further, to the extreme at which it would be seen to pose the problem of how poetry, which at its highest has always carried, at least implicitly, a kind of Platonism and claimed to give, if not knowledge itself, what was more important, a "form" to knowledge, can survive the triumph of scientific materialism and a positivism minded to skepticism about everything in the world except its own self (where it turns credulous, extremely). The poet's adjustment, over two or three centuries, to a Newtonian cosmos, Kantian criticism, the spectral universe portrayed by physics has conspicuously not been a happy one and has led alternately or simultaneously to the extremes of rejection of reason and speaking in tongues on the one hand and the hysterical claim that poetry will save the world on the other. But of this let the Protean parable speak as it will.

There is another part to the story of Menelaus and Proteus, for Menelaus asked another question: What happened to my friends who were with me at Troy? Proteus replies, "Son of Atreus, why enquire too closely of me on this? To know or learn what I know about it is not your need: I warn you that when you hear all the truth your tears will not be far behind . . . ." But he tells him all the same: "Of those others many went under; many came through . . . ." And Menelaus does indeed respond with tears of despair, until Proteus advises him to stop crying and get started on the journey home. So it sometimes happens in poetry, too: the sorrowful contemplation of what is, consoles, in the end, and heals, but only after the contemplative process has been gone through and articulated in the detail of its change:

> When to the sessions of sweet silent thought
> I summon up remembrance of things past,
> I sigh the lack of many a thing I sought,
> And with old woes new wail my dear time's waste:
> Then can I drown an eye, unused to flow,
> For precious friends hid in death's dateless night,
> And weep afresh love's long since cancell'd woe,
> And moan the expense of many a vanish'd sight.
> Then can I grieve at grievances foregone,

> And heavily from woe to woe tell o'er
> The sad account of fore-bemoaned moan,
> Which I new pay as if not paid before.
> But if the while I think on thee, dear friend,
> All losses are restor'd and sorrows end.
> (Shakespeare, Sonnet 30)

This poem, acknowledged to be a masterpiece by so many generations of readers, may stand as an epitome and emblem for the art altogether, about which it raises a question that must be put, although it cannot be satisfactorily and unequivocally answered: the question of whether poetry is a sacrament or a confidence game or both or neither. To reply firmly that poetry is not religion and must not promise what religion does is to preserve a useful distinction; nevertheless, the religions of the world, if they have nothing else in common, seem to be based on collections of sacred poems. Nor, at the other extreme, can any guarantee that poetry is not a confidence game be found in the often-heard appeal to the poet's "sincerity." One will never know whether Shakespeare wept all over the page while writing the 30th sonnet, though one inclines to doubt it, nor would it be to his credit if he did, nor to the reader's that he should know it or care to know it.

The nature of poetry

For one thing, the sonnet is obviously artful—that is, full of artifice—and even the artifice degenerates here and there into being artsy. "Then can I drown an eye, unused to flow." Surely that is poesy itself, at or near its worst, where the literal and the conventional, whatever their relations may have been for Shakespeare and the first reader of these sugar'd sonnets among his friends, now live very uncomfortably together (Ben Jonson's "Drink to me only with thine eyes" is a like example of this bathetic crossing of levels), though perhaps it has merely become unattractive as a result of changing fashions in diction.

Moreover, while the whole poem is uniquely Shakespearean, the bits and pieces are many of them common property of the age, what one writer called "joint stock company poetry." And the tricks are terribly visible, too; art is not being used to conceal art in such goings-on as "grieve at grievances" and "fore-bemoaned moan." "He who thus grieves will excite no sympathy," as Samuel Johnson sternly wrote of John Milton's style in the elegy "Lycidas," "he who thus praises will confer no honour."

Nor is that the worst of it. This man who so powerfully works on the reader's sympathies by lamenting what is past contrives to do so by thinking obsessively about litigation and, of all things, money; his hand is ever at his wallet, bidding adieu. He cannot merely "think" sweet silent thoughts about the past; no, he has to turn them into a court in "session," whereto he "summons" the probable culprit "remembrance"; when he "grieves," it is at a "grievance"—in the hands of the law again; finally, as with the sinners in Dante's *Divine Comedy,* his avarice and prodigality occupy two halves of the one circle: he bemoans his expenses while paying double the asking price.

And still, for all that, the poem remains beautiful; it continues to move both the young who come to it still innocent of their dear time's waste and the old who have sorrows to match its sorrows. As between confidence game and sacrament there may be no need to decide, as well as no possibility of deciding: elements of play and artifice, elements of true feeling, elements of convention both in the writing and in one's response to it, all combine to veil the answer. But the poem remains.

Effect of the poem as a whole

If it could be plainly demonstrated by the partisans either of unaided reason or revealed religion that poetry was metaphorical, mythological, and a delusion, while science, say, or religion or politics were real and true, then one might throw poetry away and live honestly though poorly on what was left. But, for better or worse, that is not the condition of man's life in the world; and perhaps men care for poetry so much—if they care at all—because, at last, it is the only one of man's many mythologies to be aware, and to make him aware, that it, and the others, are indeed mythological. The literary critic I.A. Richards, in a deep and searching consideration of this matter, concludes: "It is the privilege of poetry to preserve us from mistaking our notions either for things or for ourselves. Poetry is the completest mode of utterance."

> The last thing Proteus says to Menelaus is strange indeed:
> You are not to die in Argos of the fair horse-pastures, not there to encounter death: rather will the Deathless Ones carry you to the Elysian plain, the place beyond the world .... There you will have Helen to yourself and will be deemed of the household of Zeus.

So the greatest of our poets have said, or not so much said, perhaps, as indicated by their fables, though nowadays people mostly sing a different tune. To be as the gods, to be rejoined with the beloved, the world forgotten .... Sacrament or con game? Homer, of course, is only telling an old story and promises mankind nothing; that is left to the priests to do; and in that respect poetry, as one critic puts it, must always be "a ship that is wrecked on entering the harbor." And yet the greatest poetry sings always, at the end, of transcendence; while seeing clearly and saying plainly the wickedness and terror and beauty of the world, it is at the same time humming to itself, so that one overhears rather than hears: All will be well. (H.Ne.)

Prosody

As it has come to be defined in modern criticism, the term prosody encompasses the study of all of the elements of language that contribute toward acoustic and rhythmic effects, chiefly in poetry but also in prose. The term derived from an ancient Greek word that originally meant a song accompanied by music or the particular tone or accent given to an individual syllable. Greek and Latin literary critics generally regarded prosody as part of grammar; it concerned itself with the rules determining the length or shortness of a syllable, with syllabic quantity, and with how the various combinations of short and long syllables formed the metres (*i.e.,* the rhythmic patterns) of Greek and Latin poetry. Prosody was the study of metre and its uses in lyric, epic, and dramatic verse. In sophisticated modern criticism, however, the scope of prosodic study has been expanded until it now concerns itself with what the 20th-century poet Ezra Pound called "the articulation of the total sound of a poem."

Prosody and prose rhythm

Prose as well as verse reveals the use of rhythm and sound effects; however, critics do not speak of "the prosody of prose" but of prose rhythm. The English critic George Saintsbury wrote *A History of English Prosody from the Twelfth Century to the Present* (3 vol., 1906–10), which treats English poetry from its origins to the end of the 19th century; but he dealt with prose rhythm in an entirely separate work, *A History of English Prose Rhythm* (1912). Many prosodic elements such as the rhythmic repetition of consonants (alliteration) or of vowel sounds (assonance) occur in prose; the repetition of syntactical and grammatical patterns also generates rhythmic effect. Traditional rhetoric, the study of how words work, dealt with acoustic and rhythmic techniques in Classical oratory and literary prose. But although prosody and rhetoric intersected, rhetoric dealt more exactly with verbal meaning than with verbal surface. Rhetoric dealt with grammatical and syntactical manipulations and with figures of speech; it categorized the kinds of metaphor. Modern critics, especially those who practice the New Criticism, might be considered rhetoricians in their detailed concern with such devices as irony, paradox, and ambiguity. These subjects are discussed at greater length below in the section *Literary criticism* and in the article RHETORIC.

This section considers prosody chiefly in terms of the English language—the only language that all of the readers of this article may be assumed to know. Some examples are given in other languages to illustrate particular points about the development of prosody in those languages; because these examples are pertinent only for their rhythm and sound, and not at all for their meaning, no translations are given. A further general discussion of the development of prosodic elements will be found in the section above, *Poetry.*

ELEMENTS OF PROSODY

As a part of modern literary criticism, prosody is concerned with the study of rhythm and sound effects as they occur in verse and with the various descriptive, historical,

and theoretical approaches to the study of these structures.

Scansion. The various elements of prosody may be examined in the aesthetic structure of prose. The celebrated opening passage of Charles Dickens' novel *Bleak House* (1853) affords a compelling example of prose made vivid through the devices of rhythm and sound:

> Fog everywhere. Fog up the river, where it flows among green aits and meadows; fog down the river, where it rolls defiled among the tiers of shipping, and the waterside pollutions of a great (and dirty) city. Fog on the Essex Marshes, fog on the Kentish heights. Fog creeping into the cabooses of collier-brigs; fog lying out on the yards, and hovering in the rigging of great ships; fog drooping on the gunwales of barges and small boats. Fog in the eyes and throats of ancient Greenwich pensioners, wheezing by the firesides of their wards; fog in the stem and bowl of the afternoon pipe of the wrathful skipper . . . .

Two phrases of five syllables each ("Fog everywhere"; "Fog up the river") establish a powerful rhythmic expectation that is clinched in repetition:

> . . . fog down the river . . . . Fog on the Essex . . . , fog on the Kentish . . . . Fog creeping into . . . ; . . . fog drooping on the . . . .

This phrase pattern can be scanned; that is, its structure of stressed and unstressed syllables might be translated into visual symbols:

´ ˘ ˘ ´ ˘
Fog down the ri ver.

(This scansion notation uses the following symbols: the acute accent [´] to mark metrically stressed syllables; the breve [˘] to mark metrically weak syllables; a single line [|] to mark the divisions between feet [*i.e.*, basic combinations of stressed and unstressed syllables]; a double line [‖] to mark the caesura, or pause in the line; a rest [^] to mark a syllable metrically expected but not actually occurring.) Such a grouping constitutes a rhythmic constant, or cadence, a pattern binding together the separate sentences and sentence fragments into a long surge of feeling. At one point in the passage, the rhythm sharpens into metre; a pattern of stressed and unstressed syllables falls into a regular sequence:

Cadence and metre

´ ˘ ˘ ´ ˘ ´ ˘ ´ ˘ ˘
Fog on the | Es sex | mar shes, ‖ fog on the |
´ ˘ ´
Ken tish | heights.

The line is a hexameter (*i.e.*, it comprises six feet), and each foot is either a dactyl (´˘˘) or a trochee (´˘).

The passage from Dickens is strongly characterized by alliteration, the repetition of stressed consonantal sounds:

> Fog creeping into the cabooses of collier-brigs;

and by assonance, the patterned repetition of vowel sounds:

> . . . fog down the river, where it rolls defiled among . . . .

Here the vowel sounds are symmetrically distributed: short, long and long, short. Thus, it is clear that Dickens uses loosely structured rhythms, or cadences, an occasional lapse into metre, and both alliteration and assonance.

The rhythm and sound of all prose are subject to analysis; but compared with even the simplest verse, the "prosodic" structure of prose seems haphazard, unconsidered. The poet organizes his structures of sound and rhythm into rhyme, stanzaic form, and, most importantly, metre. Indeed, the largest part of prosodical study is concerned with the varieties of metre, the nature and function of rhyme, and the ways in which lines of verse fall into regular patterns or stanzas. An analysis of "Vertue" by the 17th-century English poet George Herbert reveals how the elements of prosody combine into a complex organism, a life sustained by the technical means available to the poet.

Scansion

When the metre is scanned with the symbols, it can be seen (and heard) how metre in this poem consists of the regular recurrence of feet, how each foot is a pattern of phonetically stressed and unstressed syllables.

˘ ´ ˘ ´ ˘ ´ ˘ ´
1 Sweet day, | so cool, | so calm, | so bright,
˘ ´ ˘ ´ ˘ ´ ˘ ´
2 The bri | dall of | the earth | and skie:
˘ ´ ˘ ´ ˘ ´ ˘ ´
3 The dew | shall weep | thy fall | to-night;
˘ ´ ˘ ´
4 For thou | must die.

˘ ´ ˘ ´ ´ ˘ ˘ ´
5 Sweet rose, | whose hue | an grie | and brave
´ ˘ ˘ ´ ˘ ´ ˘ ´
6 Bids the | rash ga | zer wipe | his eye:
˘ ´ ˘ ´ ˘ ´ ˘ ´
7 Thy root | is ev | er in | its grave,
˘ ´ ˘ ´
8 And thou | must die.

˘ ´ ´ ˘ ˘ ´ ˘ ´ ˘
9 Sweet spring, | full of | sweet dayes | and ro | ses,
˘ ´ ˘ ´ ˘ ´ ˘ ´
10 A box | where sweets | com pac | ted lie;
˘ ´ ˘ ´ ˘ ´ ˘ ´ ˘
11 My mu | sick shows | ye have | your clo | ses,
˘ ´ ˘ ´
12 And all | must die.

´ ˘ ˘ ´ ˘ ´ ˘ ´
13 Onely | a sweet | and ver | tuous soul,
˘ ´ ˘ ´ ˘ ´ ˘ ´
14 Like sea | son'd tim | ber, ne | ver gives;
˘ ´ ˘ ´ ˘ ´ ˘ ´
15 But though | the whole | world turn | to coal,
˘ ´ ˘ ´
16 Then chief | ly lives.

The basic prosodic units are the foot, the line, and the stanza. The recurrence of similar feet in a line determines the metre; here there are three lines consisting of four iambic feet (*i.e.*, of four units in which the common pattern is the iamb—an unstressed syllable followed by a stressed syllable), which are followed by a line consisting of two iambic feet. Thus the stanza or recurring set of lines consists of three iambic tetrameters followed by one iambic dimeter. The stanzaic form is clinched by the use of rhyme; in "Vertue" the first and third and second and fourth lines end with the same sequence of vowels and consonants: bright/night, skie/pie, brave/grave, eye/pie, etc. It should be observed that the iambic pattern (˘´) is not invariable; the third foot of line 5, the first foot of line 6, the second foot of line 9, and the first foot of line 13 are reversals of the iambic foot or trochees (´˘). These reversals are called substitutions; they provide tension between metrical pattern and meaning, as they do in these celebrated examples from Shakespeare:

˘ ´ ˘ ´ ˘ ´ ´ ˘ ˘ ´ ˘
To be, | or not | to be, ‖ *that is* | the ques tion . . . .

Hamlet

˘ ´ ˘ ´ ´ ˘ ˘ ´ ˘ ´
His sil | ver skin | *laced with* | his gol | den blood . . .

Macbeth

Meaning, pace, and sound. Scansion reveals the basic metrical pattern of the poem; it does not, however, tell everything about its prosody. The metre combines with other elements, notably propositional sense or meaning, pace or tempo, and such sound effects as alliteration, assonance, and rhyme. In the fifth line of "Vertue," the reversed third foot occurring at "angry" brings that word into particular prominence; the disturbance of the metre combines with semantic reinforcement to generate a powerful surge of feeling. Thus, the metre here is expressive. The pace of the lines is controlled by the length of number of syllables and feet, line 5 obviously takes longer to read or recite. The line contains more long vowel sounds:

> Sweet rose, whose hue angrie and brave . . .

Vowel length is called quantity. In English verse, quantity cannot by itself form metre although a number of English poets have experimented with quantitative verse. Generally speaking, quantity is a rhythmical but not a metrical feature of English poetry; it can be felt but it cannot be precisely determined. The vowel sounds in "Sweet rose" may be lengthened or shortened at will. No such options are available, however, with the stress patterns of words;

Quantity

the word an-gry cannot be read an-gry.

Assonance takes into account the length and distribution of vowel sounds. A variety of vowel sounds can be noted in this line:

Sweet day, so cool, so calm, so bright . . .

To borrow a term from music, the line modulates from ēē, through ā, ōō, ă, to ī. Alliteration takes into account the recurrence and distribution of consonants:

so *c*ool, so *c*alm . . .
*S*weet *s*pring . . .

Rhyme normally occurs at the ends of lines; "Vertue" reveals, however, a notable example of interior rhyme, or rhyme within the line:

My musick *shows* ye have your *closes* . . .

Types of metre. *Syllable-stress metres.* It has been shown that the metre of "Vertue" is determined by a pattern of stressed and unstressed syllables arranged into feet and that a precise number of feet determines the measure of the line. Such verse is called syllable-stress verse (in some terminologies accentual-syllabic) and was the norm for English poetry from the beginning of the 16th century to the end of the 19th century. A line of syllable-stress verse is made up of either two-syllable (disyllabic) or three-syllable (trisyllabic) feet. The disyllabic feet are the iamb and the trochee (noted in the scansion of "Vertue"); the trisyllabic feet are the dactyl (´˘˘) and anapest (˘˘´).

Following are illustrations of the four principal feet found in English verse:

iambic	be hold
trochaic	ti ger
dactylic	des per ate
anapestic	un der stand

Some theorists also admit the spondaic foot (´´) and pyrrhic foot (˘˘) into their scansions; however, spondees and pyrrhics occur only as substitutions for other feet, never as determinants of a metrical pattern:

When to | the ses | sions of | sweet si | lent thought . . .

It has been noted that four feet make up a line of tetrameter verse; a line consisting of one foot is called monometer, of two dimeter, of three trimeter, of five pentameter, of six hexameter, and of seven heptameter. Lines containing more than seven feet rarely occur in English poetry.

The following examples illustrate the principal varieties of syllable-stress metres and their scansions:

Iambic (pentameter)

Then say | not Man's | im per | fect, || Heaven | in fault;
Say ra | ther, || Man's | as per | fect as | he ought:
His know | ledge meas | ured || to | his state | and place,
His time | a mo | ment, || and | a point | his space.

Alexander Pope, *An Essay on Man* (1733–34)

Trochaic (dimeter)

Could I | catch that
Nim ble | trai tor
Scorn ful | Lau ra,
Swift-foot | Lau ra,
Soon then | would I
Seek a | venge ment.

Thomas Campion (1602)

Dactylic (tetrameter)

Af ter the | pangs of a | des per ate | Lover, ∧
When day and | night I have | sigh'd all in | vain, ∧ ∧
Ah what a | pleas ure it | is to dis | co ver ∧
In her eyes | pi ty, who | cau ses my | pain! ∧ ∧

John Dryden, *An Evening's Love* (1671)

Anapestic (tetrameter)

The As syr | ian came down | like a wolf | on the fold,
And his co | horts were gleam | ing in pur | ple and gold;
And the sheen | of their spears | was like stars | on the sea,
When the blue | wave rolls night | ly on deep | Ga li lee.

Lord Byron, "The Destruction of Sennacherib"(1815)

Syllable stress became more or less established in the poetry of Geoffrey Chaucer (*c.* 1340–1400). In the century that intervened between Chaucer and the early Tudor poets, syllable-stress metres were either ignored or misconstrued. By the end of the 16th century, however, the now-familiar iambic, trochaic, dactylic, and anapestic metres became the traditional prosody for English verse.

Strong-stress metres. In the middle of the 19th century, with Walt Whitman's free verse and Gerard Manley Hopkins' extensive metrical innovations, the traditional prosody was challenged. Antecedent to the syllable-stress metres was the strong-stress metre of Old English and Middle English poetry. Strong-stress verse is measured by count of stresses alone; the strong stresses are usually constant, but the number of unstressed syllables may vary considerably.

Challenges to traditional prosody in the 19th century

Strong-stress verse survives in nursery rhymes and children's counting songs:

One, two, || buckle my shoe;
Three, four, || knock at the door;
Five, six, || pick up sticks . . .

The systematic employment of strong-stress metre can be observed in the Old English epic poem *Beowulf* (*c.* 1000) and in William Langland's vision-poem, *Piers Plowman* ('A' Text, *c.* 1362):

In a somer sesun || whon softe was the sonne,
I schop me in-to a schroud || a scheep as I were;
In habite of an hermite || un-holy of werkes,
Wende I wydene in this world || wondres to here.

These lines illustrate the structural pattern of strong-stress metre. Each line divides sharply at the caesura (||), or medial pause; on each side of the caesura are two stressed syllables strongly marked by alliteration.

Strong-stress verse is indigenous to the Germanic languages with their wide-ranging levels of stressed syllables and opportunities for alliteration. Strong-stress metre was normative to Old English and Old Germanic heroic poetry, as well as to Old English lyric poetry. With the rising influence of French literature in the 12th and 13th centuries, rhyme replaced alliteration and stanzaic forms replaced the four-stress lines. But the strong-stress rhythm persisted; it can be felt in the anonymous love lyrics of the 14th century and in the popular ballads of the 15th century.

"Lord Randal" can be comfortably scanned to show a line of mixed iambic and anapestic feet; it clearly reveals, however, a four-stress structure:

'O where ha' you been, || Lord Randal, my son?

´ ´ ´ ´

And where ha' you been, || my handsome young man?'

´ ´ ´ ´

'I ha' been at the greenwood; || mother, mak my bed soon,

´ ´ ´ ´

For I'm wearied wi' huntin', || and fain wad lie down.'

A number of 20th-century poets, including Ezra Pound, T.S. Eliot, and W.H. Auden, have revived strong-stress metre. The versification of Pound's *Cantos* and Eliot's *Four Quartets* (1943) shows the vitality of the strong-stress, or, as they are often called, "native," metres.

Syllabic metres. Most of English poetry is carried by the strong-stress and syllable-stress metres. Two other kinds of metres must be mentioned: the purely syllabic metres and the quantitative metres. The count of syllables determines the metres of French, Italian, and Spanish verse. In French poetry the alexandrine, or 12-syllabled line, is a dominant metrical form:

The dominant alexandrine

O toi, qui vois la honte où je suis descendue,
Implacable Vénus, suis-je assez confondue?
Tu ne saurais plus loin pousser ta cruauté.
Ton triomphe est parfait; tous tes traits ont porté.
Racine, *Phèdre* (1677)

Stress and pause in these lines are variable; only the count of syllables is fixed. English poets have experimented with syllabic metres; the Tudor poet Thomas Wyat's translations from Petrarch's Italian poems of the 14th century attempted to establish a metrical form based on a decasyllabic or 10-syllabled line:

The long love that in my thought doth harbor,
And in my heart doth keep his residence,
Into my face presseth with bold pretense
And there encampeth, spreading his banner.
"The Lover for Shamefastness Hideth . . ." (1557)

Most ears can detect that these lines waver between syllabic and syllable-stress metre; the second line falls into a pattern of iambic feet. Most ears also discover that the count of syllables alone does not produce any pronounced rhythmic interest; syllabic metres in English generate a prosody more interesting to the eye than to the ear.

Quantitative metres. Quantitative metres determine the prosody of Greek and Latin verse. Renaissance theorists and critics initiated a confused and complicated argument that tried to explain European poetry by the rules of Classical prosody and to draft laws of quantity by which European verse might move in the hexameters of the ancient Roman poets Virgil or Horace. Confusion was compounded because both poets and theorists used the traditional terminology of Greek and Latin prosody to describe the elements of the already existing syllable-stress metres; iambic, trochaic, dactylic, and anapestic originally named the strictly quantitative feet of Greek and Latin poetry. Poets themselves adapted the metres and stanzas of Classical poetry to their own languages; whereas it is not possible here to trace the history of Classical metres in European poetry, it is instructive to analyze some attempts to make English and German syllables move to Greek and Latin music. Because neither English nor German has fixed rules of quantity, the poets were forced to revise the formal schemes of the Classical paradigms in accordance with the phonetic structure of their own language.

A metrical paradigm much used by both Greek and Latin poets was the so-called Sapphic stanza. It consisted of three quantitative lines that scanned

– ∪ – – – ∪ ∪ – ∪ – ∪,

followed by a shorter line, called an Adonic,

– ∪ ∪ – – .

Sapphics in English and German

"Sapphics" by the 19th-century English poet Algernon Charles Swinburne shows the Sapphic metre and stanza in English:

All the night sleep came not upon my eyelids,
Shed not dew, nor shook nor unclosed a feather,
Yet with lips shut close and with eyes of iron
Stood and beheld me . . .
Saw the white implacable Aphrodite,
Saw the hair unbound and the feet unsandalled
Shine as fire of sunset on western waters;
Saw the reluctant . . . .

The same metre and stanza in German are found in "Sapphische Ode," by the 19th-century poet Hans Schmidt, which was beautifully set to music by Johannes Brahms (Opus 94, No. 4):

Rosen brach ich nachts mir am dunklen Hage;
süsser hauchten Duft sie, als je am Tage;
doch verstreuten reich die bewegten Äste
Tau den mich nässte.
Auch der Küsse Duft mich wie nie berückte,
die ich nachts vom Strauch deiner Lippen pflückte:
doch auch dir, bewegt im Gemüt gleich jenem,
tauten die Tränen.

Quantitative metres originated in Greek, a language in which the parts of speech appear in a variety of inflected forms (*i.e.,* changes of form to indicate distinctions in case, tense, mood, number, voice, and others). Complicated metrical patterns and long, slow-paced lines developed because the language was hospitable to polysyllabic metrical feet and to the alternation of the longer vowels characterizing the root syllables and the shorter vowels characterizing the inflected case-endings. The Classical metres can be more successfully adapted to German than to English because English lost most of its inflected forms in the 15th century, while German is still a highly inflected language. Thus Swinburne's "Sapphics" does not move as gracefully, as "naturally" as Schmidt's. A number of German poets, notably Goethe and Friedrich Hölderlin, both of the early 19th century, made highly successful use of the Classical metres. English poets, however, have never been able to make English syllables move in the ancient metres with any degree of comfort or with any sense of vital rhythmic force.

The American poet Henry Wadsworth Longfellow adapted the Classical hexameter for his *Evangeline* (1847):

´ ∪ ∪ ´ ∪ ∪ ´ ∪ ∪ ´ ∪ ∪ ´ ∪

This is the | for est pri | me val. The | mur mu ring | pines and

∪ ´ ∪

the | hem locks . . .

In Virgil's *Aeneid,* Longfellow's Classical model, the opening line scans:

– ∪ ∪ – ∪ ∪ – – – ∪ – ∪ ∪ – –

Ar ma vi rum que ca no, Troj ae qui pri mus ab or is

The rules determining length of syllable in Classical Greek and Latin poetry are numerous and complicated; they were established by precise grammatical and phonetic conventions. No such rules and conventions obtain in English; Robert Bridges, the British poet laureate and an authority on prosody, remarked in his *Poetical Works* (1912) that the difficulty of adapting English syllables to the Greek rules is "very great, and even deterrent." Longfellow's hexameter is in reality a syllable-stress line of five dactyls and a final trochee; syllabic quantity plays no part in determining the metre.

PROSODIC STYLE

The analysis of prosodic style begins with recognizing the metrical form the poet uses. Is he writing syllable-stress, strong-stress, syllabic, or quantitative metre? Or is he using a nonmetrical prosody? Again, some theorists would not allow that poetry can be written without metre; the examples of Whitman and many 20th-century innovators, however, have convinced most modern critics that a nonmetrical prosody is not a contradiction in terms but an obvious feature of modern poetry. Metre has not disappeared as an important element of prosody; indeed, some of the greatest poets of the modern period—William Butler Yeats, T.S. Eliot, Ezra Pound, Wallace Stevens—revealed themselves as masters of the traditional metres. They also experimented with newer prosodies based on prose cadences, on expansions of the blank-verse line, and revivals of old forms—such as strong-stress and ballad metres. Also noteworthy are the "visual" prosodies fostered by the poets of the Imagist movement and by such experimenters as e.e. cummings. Cummings revived the practice of certain 17th-century poets (notably George Herbert) of "shaping" the poem by typographic arrangements.

Nonmetrical prosody

The prosodic practice of poets has varied enormously with the historical period, the poetic genre, and the poet's

individual style. In English poetry, for example, during the Old English period (to 1100), the strong-stress metres carried both lyric and narrative verse. In the Middle English period (from *c.* 1100 to *c.* 1500), stanzaic forms developed for both lyric and narrative verse. The influence of French syllable counting pushed the older stress lines into newer rhythms; Chaucer developed for *The Canterbury Tales* a line of 10 syllables with alternating accent and regular end rhyme—an ancestor of the heroic couplet. The period of the English Renaissance (from *c.* 1500 to 1660) marks the fixing of syllable-stress metre as normative for English poetry. Iambic metre carried three major prosodic forms: the sonnet, the rhyming couplet, and blank verse. The sonnet was the most important of the fixed stanzaic forms. The iambic pentameter rhyming couplet (later known as the heroic couplet) was used by Christopher Marlowe for his narrative poem *Hero and Leander* (1598); by John Donne in the early 17th century for his satires, his elegies, and his longer meditative poems. Blank verse (unrhymed iambic pentameter), first introduced into English in a translation by Henry Howard, earl of Surrey, published in 1557, became the metrical norm for Elizabethan drama. The period of the Renaissance also saw the refinement of a host of lyric and song forms; the rapid development of English music during the second half of the 16th century had a salutary effect on the expressive capabilities of poetic rhythms.

The personal element. A poet's choice of a prosody obviously depends on what his language and tradition afford; these are primary considerations. The anonymous author of the Old English poem *Deor* used the conventional four-stress metric available to him; but he punctuated groups of lines with a refrain:

> þaes ofereode: þisses swa maeg!
> (that passed away: this also may!)

The refrain adds something to the prosodic conventions of regulated stress, alliteration, and medial pause: a sense of a smaller and sharper rhythmic unit within the larger rhythms of the given metre. While the poet accepts from history his language and from poetic convention the structure of his metre, he shapes his own style through individual modifications of the carrying rhythms. When critics speak of a poet's "voice," his personal tone, they are also speaking of his prosodic style.

Style through tension

Prosodic style must be achieved through a sense of tension; it is no accident that the great masters of poetic rhythm work against the discipline of a given metrical form. In his sonnets, Shakespeare may proceed in solemn iambic regularity, creating an effect of measured progression through time and its legacy of suffering and despair:

> No longer mourn for me when I am dead
> Than you shall hear the surly sullen bell
> Give warning to the world that I am fled . . . .
>
> "Sonnet 71"

Or he may wrench the metre and allow the reader to feel the sudden violence of his feelings, the power of a conviction raised to a command:

> ′ ∪ ′ ∪ ∪ ′ ∪ ∪ ′ ′
> Let me | not to | the mar | riage of | true minds
> ∪ ′ ∪ ′ ∪ ′ ′ ∪ ∪ ′
> Ad mit | im pe | di ments. | Love is | not love . . . .
>
> "Sonnet 116"

The first two feet of the first line are trochaic reversals; the last two feet comprise a characteristic pyrrhic-spondaic formation. A trochaic substitution is quite normal in the first foot of an iambic pentameter line; a trochaic substitution in the second foot, however, creates a marked disturbance in the rhythm. There is only one "normal" iambic foot in the first line; this line runs over (or is enjambed) to the second line with its three consecutive iambic feet followed by a strong caesura and reversed fourth foot. These lines are, in Gerard Manley Hopkins' terms, metrically "counter-pointed"; trochees, spondees, and pyrrhics are heard against a ground rhythm of regular iambics. Without the ground rhythm, Shakespeare's expressive departures would not be possible.

A poet's prosodic style may show all of the earmarks of revolt against prevailing metrical practice. Whitman's celebrated "free verse" marks a dramatic break with the syllable-stress tradition; he normally does not count syllables, stresses, or feet in his long sweeping lines. Much of his prosody is rhetorical; that is, Whitman urges his language into rhythm by such means as anaphora (*i.e.*, repetition at the beginning of successive verses) and the repetition of syntactical units. He derives many of his techniques from the example of biblical verses, with their line of various types of parallelism. But he often moves toward traditional rhythms; lines fall into conventional parameters:

Whitman's innovations

> O past! O happy life! O songs of joy!
>
> "Out of the Cradle Endlessly Rocking" (1859)

Or they fall more often into dissyllabic hexameters:

> Borne through the smoke of the battles and pierc'd
> with missiles I saw them . . . .
>
> "When Lilacs Last in the Dooryard Bloom'd" (1865–66)

Despite the frequent appearance of regular metrical sequences, Whitman's lines cannot be scanned by the usual graphic method of marking syllables and feet; his prosody, however, is fully available to analysis. The shape on the page of the lines below (they comprise a single strophe or verse unit) should be noted, specifically the gradual elongation and sudden diminution of line length. Equally noteworthy are the repetition of the key word *carols*, the alliteration of the *s* sounds, and the use of words in falling (trochaic) rhythm, "lagging," "yellow," "waning":

> Shake out carols!
> Solitary here, the night's carols!
> Carols of lonesome love! death's carols!
> Carols under that lagging, yellow, waning moon!
> O under that moon where she droops almost down into
> the sea!
> O reckless despairing carols.
>
> "Out of the Cradle"

No regular metre moves these lines; but a clearly articulated rhythm—produced by shape, thematic repetitions, sound effects, and patterns of stress and pause—defines a prosody.

Whitman's prosody marks a clear break with previous metrical practices. Often a new prosody modifies an existing metrical form or revives an obsolete one. In "Gerontion" (1920), T.S. Eliot adjusted the blank-verse line to the emotionally charged, prophetic utterance of his persona, a spiritually arid old man:

> After such knowledge, what forgiveness? Think now
> History has many cunning passages, contrived corridors
> And issues, deceives with whispering ambitions,
> Guides us by vanities. Think now . . .
>
> (From T.S. Eliot, *Collected Poems 1909–1962*, Harcourt Brace Jovanovich, Inc.)

The stress prosodies of Pound and Eliot

The first three lines expand the pentameter line beyond its normal complement of stressed and unstressed syllables; the fourth line contracts, intensifying the arc of feeling. Both Pound and Eliot used stress prosodies. Pound counted out four strong beats and used alliteration in his brilliant adaptation of the old English poem "The Seafarer" (1912):

> Chill its chains are; chafing sighs
> Hew my heart round and hunger begot
> Mere-weary mood. Lest man known not
> That he on dry land loveliest liveth . . .
>
> (From Ezra Pound, *Personae*, Copyright 1926 by Ezra Pound. Reprinted by permission of New Directions Publishing Corporation.)

He uses a similar metric for the energetic opening of his "Canto I." Eliot mutes the obvious elements of the form in the celebrated opening of *The Waste Land* (1922):

> April is the cruellest month, breeding
> Lilacs out of the dead land, mixing
> Memory and desire, stirring
> Dull roots with spring rain.
>
> (From T.S. Eliot, *Collected Poems 1909–1962*, Harcourt Brace Jovanovich, Inc.)

Here is the "native metre" with its falling rhythm, elegiac tone, strong pauses, and variably placed stresses. If this is free verse, its freedoms are most carefully controlled. "No verse is free," said Eliot, "for the man who wants to do a good job."

The prosodic styles of Whitman, Pound, and Eliot—

though clearly linked to various historical antecedents—are innovative expressions of their individual talents. In a sense, the prosody of every poet of genius is unique; rhythm is perhaps the most personal element of the poet's expressive equipment. Alfred Lord Tennyson and Robert Browning, English poets who shared the intellectual and spiritual concerns of the Victorian age, are miles apart in their prosodies. Both used blank verse for their dramatic lyrics, poems that purport to render the accents of real men speaking. The blank verse of Tennyson's "Ulysses" (1842) offers smoothly modulated vowel music, carefully spaced spondaic substitutions, and unambiguous pentameter regularity:

The prosody of Tennyson and Browning

> The long day wanes; the slow moon climbs; the deep
> Moans round with many voices. Come, my friends,
> 'Tis not too late to seek a newer world.

Browning's blank verse aims at colloquial vigour; its "irregularity" is a function not of any gross metrical violation—it always obeys the letter of the metrical law—but of the adjustment of abstract metrical pattern to the rhythms of dramatic speech. If Tennyson's ultimate model is Milton's Baroque prosody with its oratorical rhythms, Browning's model was the quick and nervous blank verse of the later Elizabethan dramatists. Characteristic of Browning's blank verse are the strong accents, involuted syntax, pregnant caesuras, and headlong energy in "The Bishop Orders His Tomb at St. Praxed's Church" (1845):

> Vanity, saith the preacher, vanity!
> Draw round my bed: is Anselm keeping back?
> Nephews—sons mine . . . ah God, I know not! Well—
> She, men would have to be your mother once,
> Old Gandolf envied me, so fair she was!

Influence of period and genre. In the lyric genres, the rhythms of the individual poet—or, in the words of the 20th-century American poet Robert Lowell, "the person himself"—can be heard in the prosody. In the long poem, the dramatic, narrative, and didactic genres, a period style is more likely to be heard in prosody. The blank-verse tragedy of the Elizabethan and Jacobean dramatists, the blank verse of Milton's *Paradise Lost* (1667) and its imitators in the 18th century (James Thomson and William Cowper), and the heroic couplet of Neoclassical satiric and didactic verse, each, in different ways, defines the age in which these prosodies flourished. The flexibility and energy of the dramatic verse of Marlowe, Shakespeare, and John Webster reflect the later Renaissance with its nervous open-mindedness, its obsessions with power and domination, and its lapses into despair. Miltonic blank verse, based on Latin syntax and adaptations of the rules of Latin prosody, moved away from the looseness of the Elizabethans and Jacobeans toward a more ceremonial style. It is a Baroque style in that it exploits the musical qualities of sounds for their ornamental values. The heroic couplet, dominating the poetry of the entire 18th century, was unequivocally a prosodic period style; its elegance and epigrammatic precision entirely suited an age that valued critical judgment, satiric wit, and the powers of rationality.

Prosody in dramatic verse

It is in dramatic verse, perhaps, that a prosody shows its greatest vitality and clarity. Dramatic verse must make a direct impression not on an individual reader able to reconsider and meditate on what he has read but on an audience that must immediately respond to a declaiming actor or a singing chorus. The ancient Greek dramatists developed two distinct kinds of metres: "stichic" forms (*i.e.,* consisting of "stichs," or lines, as metrical units) such as the iambic trimeter for the spoken dialogues; and lyric, or strophic, forms (*i.e.,* consisting of stanzas), of great metrical intricacy, for the singing and chanting of choruses. Certain of the Greek metres developed a particular ethos; characters of low social standing never were assigned metres of the lyric variety. Similar distinctions obtained in Elizabethan drama. Shakespeare's kings and noblemen speak blank verse; comic characters, servants, and country bumpkins discourse in prose; clowns, romantic heroines, and supernatural creatures sing songs. In the early tragedy *Romeo and Juliet,* the chorus speaks in "excellent conceited" sonnets: in what was one of the most popular and easily recognized lyric forms of the period.

The metrical forms used by ancient and Renaissance dramatists were determined by principles of decorum. The use or non-use of a metrical form (or the use of prose) was a matter of propriety; it was important that the metre be suitable to the social status and ethos of the individual character as well as be suitable to the emotional intensity of the particular situation. Decorum, in turn, was a function of the dominant Classical and Neoclassical theories of imitation.

THEORIES OF PROSODY

Ancient critics like Aristotle and Horace insisted that certain metres were natural to the specific poetic genres; thus, Aristotle (in the *Poetics*) noted that "Nature herself, as we have said, teaches the choice of the proper measure." In epic verse the poet should use the heroic measure (dactylic hexameter) because this metre most effectively represents or imitates such qualities as grandeur, dignity, and high passion. Horace narrowed the theory of metrical decorum, making the choice of metre prescriptive; only an ill-bred and ignorant poet would treat comic material in metres appropriate to tragedy. Horace prepared the way for the legalisms of the Renaissance theorists who were quite willing to inform practicing poets that they used "feete without joyntes," in the words of Roger Ascham, Queen Elizabeth's tutor, and should use the quantitative metres of Classical prosody.

The Middle Ages. During the Middle Ages little of importance was added to actual prosodic theory; in poetic practice, however, crucial developments were to have important ramifications for later theorists. From about the second half of the 6th century to the end of the 8th century, Latin verse was written that no longer observed the rules of quantity but was clearly structured on accentual and syllabic bases. This change was aided by the invention of the musical sequence; it became necessary to fit a musical phrase to a fixed number of syllables, and the older, highly complex system of quantitative prosody could not be adapted to simple melodies that must be sung in sequential patterns. In the musical sequence lies the origin of the modern lyric form.

The musical sequence

The 9th-century hymn "Ave maris stella" is a striking instance of the change from quantitative to accentual syllabic prosody; each line contains three trochaic feet determined not by length of syllable but by syllabic intensity or stress:

> Ave maris stella
> Dei mater alma
> atque semper virgo,
> felix caeli porta.
>
> Sumens illud *Ave*
> Gabrielis ore,
> funda nos in pace,
> mutans nomen Evae.

The rules of quantity have been disregarded or forgotten; rhyme and stanza and a strongly felt stress rhythm have taken their place. In the subsequent emergence of the European vernacular literatures, poetic forms follow the example of the later Latin hymns. The earliest art lyrics, those of the Provençal troubadours of the 12th and 13th centuries, show the most intricate and ingenious stanzaic forms. Similarly, the Goliardic songs of the *Carmina Burana* (13th century) reveal a rich variety of prosodic techniques; this "Spring-song" embodies varying lines of trochees and iambs and an ababcdcd rhyme scheme:

> Ver redit optatum
> Cum gaudio,
> Flore decoratum
> Purpureo;
> Aves edunt cantus
> Quam dulciter!
> Revirescit nemus,
> Cantus est amoenus
> Totaliter.

The Renaissance. Renaissance prosodic theory had to face the fact of an accomplished poetry in the vernacular that was not written in metres determined by "rules" handed down from the practice of Homer and Virgil. Nevertheless, the classicizing theorists of the 16th century made a determined attempt to explain existing poetry

by the rules of short and long and to draft "laws" by which modern verse might move in Classical metres. Roger Ascham, in *The Scholemaster* (1570), attacked "the Gothic . . . barbarous and rude Ryming" of the early Tudor poets. He admitted that Henry Howard, earl of Surrey, did passably well as a poet but complained that Surrey did not understand "perfite and trewe versifying"; that is, Surrey did not compose his English verses according to the principles of Latin and Greek quantitative prosody.

Rules of "trewe versifying"

Ascham instigated a lengthy argument, continued by succeeding theorists and poets, on the nature of English prosody. Sir Philip Sidney, Gabriel Harvey, Edmund Spenser, and Thomas Campion all (to use Saintsbury's phrase) committed whoredom with the enchantress of quantitative metric. While this hanky-panky had no adverse effect on poetry itself (English poets went on writing verses in syllable-stress, the prosody most suitable to the language), it produced misbegotten twins of confusion and discord, whose heirs, however named, are still apparent today. Thus, those who still talk about "long and short" (instead of stressed and unstressed), those who perpetuate a punitive prosodic legalism, and those who regard prosody as an account of what poets should have done and did not, trace their ancestry back to Elizabethan dalliance and illicit classicizing.

Although Renaissance prosodic theory produced scarcely anything of value to either literary criticism or poetic technique—indeed, it did not even develop a rational scheme for scanning existing poetry—it raised a number of important questions. What were the structural principles animating the metres of English verse? What were the aesthetic nature of prosody and the functions of metre? What were the connections between poetry and music? Was poetry an art of imitation (as Aristotle and all of the Neoclassical theorists had maintained), and was its sister art painting; or was poetry (as Romantic theory maintained) an art of expression, and prosody the element that produced (in Coleridge's words) the sense of musical delight originating (in T.S. Eliot's words) in the auditory imagination?

Pope's doctrine of imitation

The 18th century. Early in the 18th century, Pope affirmed, in his *Essay on Criticism* (1711), the classic doctrine of imitation. Prosody was to be more nearly onomatopoetic; the movement of sound and metre should represent the actions they carry:

> 'Tis not enough no harshness gives offence,
> The sound must seem an Echo to the sense:
> Soft is the strain when Zephyr gently blows,
> And the smooth stream in smoother numbers flows;
> But when loud surges lash the sounding shoar,
> The hoarse, rough verse should like the torrent roar.
> When Ajax strives some rock's vast weight to throw,
> The line too labours, and the words move slow;
> Not so, when swift Camilla scours the plain,
> Flies o'er th' unbending corn, and skims along the main.

In 18th-century theory the doctrine of imitation was joined to numerous strictures on "smoothness," or metrical regularity. Theorists advocated a rigid regularity; minor poets composed in a strictly regular syllable-stress verse devoid of expressive variations. This regularity itself expressed the rationalism of the period. The prevailing dogmas on regularity made it impossible for Samuel Johnson to hear the beauties of Milton's versification; he characterized the metrically subtle lines of "Lycidas" as "harsh" and without concern for "numbers." Certain crosscurrents of metrical opinion in the 18th century, however, moved toward new theoretical stances. Joshua Steele's *Prosodia Rationalis* (1779) is an early attempt to scan English verse by means of musical notation. (A later attempt was made by the American poet Sidney Lanier in his *Science of English Verse,* 1880.) Steele's method is highly personal, depending on an idiosyncratic assigning of such musical qualities as pitch and duration to syllabic values; but he recognized that a prosodic theory must take into account not merely metre but "all properties or accidents belonging to language." His work foreshadows the current concerns of the structural linguists who attempt an analysis of the entire range of acoustic elements contributing to prosodic effect. Steele is also the first "timer" among metrists; that is, he bases his scansions on musical pulse and claims that English verse moves in either common or triple time. Modern critics of musical scanners have pointed out that musical scansion constitutes a performance, not an analysis of the metre, that it allows arbitrary readings, and that it levels out distinctions between poets and schools of poetry.

The 19th century. With the Romantic movement and its revolutionary shift in literary sensibility, prosodic theory became deeply influenced by early 19th-century speculation on the nature of imagination, on poetry as expression—"the spontaneous overflow of powerful feelings," in Wordsworth's famous phrase—and on the concept of the poem as organic form. The discussion between Wordsworth and Coleridge on the nature and function of metre illuminates the crucial transition from Neoclassical to modern theories. Wordsworth (in his "Preface" to the *Lyrical Ballads,* 1800) followed 18th-century theory and saw metre as "superadded" to poetry; its function is more nearly ornamental, a grace of style and not an essential quality. Coleridge saw metre as being organic; it functions together with all of the other parts of a poem and is not merely an echo to the sense or an artifice of style. Coleridge also examined the psychologic effects of metre, the way it sets up patterns of expectation that are either fulfilled or disappointed:

The poem as organic form

> As far as metre acts in and for itself, it tends to increase the vivacity and susceptibility both of the general feelings and of the attention. This effect it produces by the continued excitement of surprize, and by the quick reciprocations of curiosity still gratified and still re-excited, which are too slight indeed to be at any one moment objects of distinct consciousness, yet become considerable in their aggregate influence. As a medicated atmosphere, or as wine during animated conversation; they act powerfully, though themselves unnoticed. Where, therefore, correspondent food and appropriate matter are not provided for the attention and feelings thus roused, there must needs be a disappointment felt; like that of leaping in the dark from the last step of a staircase, when we had prepared our muscles for a leap of three or four.
>
> *Biographia Literaria,* XVIII (1817)

Romantic literary theory, although vastly influential in poetic practice, had little to say about actual metrical structure. Coleridge described the subtle relationships between metre and meaning and the effects of metre on the reader's unconscious mind; he devoted little attention to metrical analysis. Two developments in 19th-century poetic techniques, however, had greater impact than any prosodic theory formulated during the period. Walt Whitman's nonmetrical prosody and Gerard Manley Hopkins' far-ranging metrical experiments mounted an assault on the traditional syllable-stress metric. Both Whitman and Hopkins were at first bitterly denounced, but, as is often the case, the heresies of a previous age become the orthodoxies of the next. Hopkins' "sprung rhythm"—a rhythm imitating natural speech, using mixed types of feet and counterpointed verse—emerged as viable techniques in the poetry of Dylan Thomas and W.H. Auden. It is virtually impossible to assess Whitman's influence on the various prosodies of modern poetry. Such American poets as Hart Crane, William Carlos Williams, and Theodore Roethke all have used Whitman's long line, extended rhythms, and "shaped" strophes.

The 20th century. Since 1900 the study of prosody has emerged as an important and respectable part of literary study. George Saintsbury published his great *History of English Prosody* during the years 1906–10. Sometime later, a number of linguists and aestheticians turned their attention to prosodic structure and the nature of poetic rhythm. Graphic prosody (the traditional syllable and foot scansion of syllable-stress metre) was placed on a securer theoretical footing. A number of prosodists, taking their lead from the work of Joshua Steele and Sidney Lanier, have recently attempted to use musical notation to scan English verse. For the convenience of synoptic discussion, modern prosodic theorists may be divided into four groups: the linguists who examine verse rhythm as a function of phonetic structures; the aestheticians who examine the psychologic effects, the formal properties, and the phenomenology of rhythm; the musical scanners, or "timers," who try to adapt the procedures of musical notation to

Linguists, aestheticians, timers, and traditionalists

metrical analysis; and the traditionalists who rely on the graphic description of syllable and stress to uncover metrical paradigms. It is necessary to point out that only the traditionalists concern themselves specifically with metrical form; aestheticians, linguists, and timers all examine prosody in its larger dimensions.

Modern structural linguistics has placed the study of language on a solid scientific basis. Linguists have measured the varied intensities of syllabic stress and pitch and the durations of junctures or the pauses between syllables. These techniques of objective measurement have been applied to prosodic study. The Danish philologist Otto Jespersen's early essay "Notes on Metre" (1900) made a number of significant discoveries. He established the principles of English metre on a demonstrably accurate structural basis; he recognized metre as a gestalt phenomenon (*i.e.*, with emphasis on the configurational whole); he saw metrics as descriptive science rather than proscriptive regulation. Jespersen's essay was written before the burgeoning interest in linguistics, but since World War II numerous attempts have been made to formulate a descriptive science of metrics.

It has been noted that Coleridge defined metrical form as a pattern of expectation, fulfillment, and surprise. Taking his cue from Coleridge, the British aesthetician I.A. Richards in *Principles of Literary Criticism* (1924) developed a closely reasoned theory of the mind's response to rhythm and metre. His theory is organic and contextual; the sound effects of prosody have little psychologic effect by themselves. It is prosody in conjunction with "its contemporaneous other effects"—chiefly meaning or propositional sense—that produces its characteristic impact on our neural structures. Richards insists that everything that happens in a poem depends on the organic environment; in his *Practical Criticism* (1929) he constructed a celebrated "metrical dummy" to "support [an] argument against anyone who affirms that the mere sound of verse has *independently* any considerable aesthetic virtue." For Richards the most important function of metre is to provide aesthetic framing and control; metre makes possible, by its stimulation and release of tensions, "the most difficult and delicate utterances."

Rhythmic structure as a symbolic form

Other critics, following the Neo-Kantian theories of the philosophers Ernst Cassirer and Susanne Langer, have suggested that rhythmic structure is a species of symbolic form. Harvey Gross in *Sound and Form in Modern Poetry* (1964) saw rhythmic structure as a symbolic form, signifying ways of experiencing organic processes and the phenomena of nature. The function of prosody, in his view, is to image life in a rich and complex way. Gross's theory is also expressive; prosody articulates the movement of feeling in a poem. The unproved assumption behind Gross's expressive and symbolic theory is that rhythm is in some way iconic to human feeling: that a particular rhythm or metre symbolizes, as a map locates the features of an actual terrain, a particular kind of feeling.

The most sophisticated argument for musical scansion is given by Northrop Frye in his influential *Anatomy of Criticism* (1957). He differentiates between verse that shows unmistakable musical quality and verse written according to the imitative doctrines current in the Renaissance and Neoclassic periods. All of the poetry written in the older strong-stress metric, or poetry showing its basic structure, is musical poetry, and its structure resembles the music contemporary with it.

The most convincing case for traditional "graphic prosody" has been made by the American critics W.K. Wimsatt and Monroe C. Beardsley. Their essay "The Concept of Meter" (1965) argues that both the linguists and musical scanners do not analyze the abstract metrical pattern of poems but only interpret an individual performance of the poem. Poetic metre is not generated by any combination of stresses and pauses capable of precise scientific measurement; rather, metre is generated by an abstract pattern of syllables standing in positions of relative stress to each other. In a line of iambic pentameter

Preserved in Milton's or in Shakespeare's name . . .

the "or" of the third foot is only slightly stronger than the preceding syllable "-ton's," but this very slight difference makes the line recognizable as iambic metre. Wimsatt and Beardsley underline the paradigmatic nature of metre; as an element in poetic structure, it is capable of exact abstraction.

Non-Western theories. The metres of the verse of ancient India were constructed on a quantitative basis. A system of long and short syllables, as in Greek, determined the variety of complicated metrical forms that are found in poetry of post-Vedic times—that is, after the 5th century BC.

Chinese prosody is based on the intricate tonal system of the language. In the T'ang dynasty (AD 618–907) the metrical system for classical verse was fixed. The various tones of the language were subsumed under two large groups, even tones and oblique tones. Patterned arrangements of tones and the use of pauses, or caesuras, along with rhyme determine the Chinese prosodic forms.

Japanese prosody

Japanese poetry is without rhyme or marked metrical structure; it is purely syllabic. The two main forms of syllabic verses are the tanka and the haiku. Tanka is written in a stanza of 31 syllables that are divided into alternating lines of five and seven syllables. Haiku is an extremely concentrated form of only 17 syllables. Longer poems of 40 to 50 lines are also written; however, alternate lines must contain either five or seven syllables. The haiku form has been adapted to English verse and has become in recent years a popular form. Other experimenters in English syllabic verse show the influence of Japanese prosody. Syllabic metre in English, however, is limited in its rhythmic effects; it is incapable of expressing the range of feeling that is available in the traditional stress and syllable-stress metres. (Ha.G.)

NARRATIVE FICTION

Epic

An ambiguous term, "epic" is used most often to designate a long narrative poem recounting heroic deeds, though it has also been loosely used to describe novels, such as Tolstoy's *War and Peace*, and motion pictures, such as Eisenstein's *Ivan the Terrible*. In literary usage, the term encompasses both oral and written compositions. The prime examples of the oral epic are Homer's *Iliad* and *Odyssey*. Outstanding examples of the written epic include Virgil's *Aeneid* and Lucan's *Pharsalia* in Latin; *Chanson de Roland* in medieval French; Ariosto's *Orlando Furioso* and Tasso's *Gerusalemme liberata* in Italian; *Poema* (or *Cantar*) *de mio Cid* in Spanish; and Milton's *Paradise Lost* and Spenser's *Faerie Queene* in English. There are also seriocomic epics, such as the *Morgante* of a 15th-century Italian poet, Pulci, and the pseudo-Homeric *Battle of the Frogs and Mice*. Another distinct group is made up of the so-called beast epics—narrative poems written in Latin in the Middle Ages and dealing with the struggle between a cunning fox and a cruel and stupid wolf. Underlying all of the written forms is some trace of an oral character, partly because of the monumental persuasiveness of Homer's example but more largely because the epic was, in fact, born of an oral tradition. It is on the oral tradition of the epic form that this article will focus.

GENERAL CHARACTERISTICS

The epic as a genre of heroic ages

An epic may deal with such various subjects as myths, heroic legends, histories, edifying religious tales, animal stories, or philosophical or moral theories. Epic poetry has been used by peoples all over the world and in different ages to transmit their traditions from one generation to another, without the aid of writing. These traditions frequently consist of legendary narratives about the glorious deeds of their national heroes. Thus scholars have often

identified "epic" with a certain kind of heroic oral poetry, which comes into existence in so-called heroic ages. Such ages have been experienced by many nations, usually at a stage of development in which they have had to struggle for a national identity. This effort, combined with such other conditions as an adequate material culture and a sufficiently productive economy, tend to produce a society dominated by a powerful and warlike nobility, constantly occupied with martial activities, whose individual members seek, above all, everlasting fame for themselves and for their lineages.

Uses of the epic. The main function of poetry in heroic-age society appears to be to stir the spirit of the warriors to heroic actions by praising their exploits and those of their illustrious ancestors, by assuring a long and glorious recollection of their fame, and by supplying them with models of ideal heroic behaviour. One of the favorite pastimes of the nobility in heroic ages in different times and places has been to gather in banquet halls to hear heroic songs, in praise of famous deeds sung by professional singers as well as by the warriors themselves. Heroic songs also were often sung before a battle, and such recitations had tremendous effect on the morale of the combatants. Among the Fulani (Fulbe) people in The Sudan, for instance, whose epic poetry has been recorded, a nobleman customarily set out in quest of adventures accompanied by a singer (*mabo*), who also served as his shield bearer. The singer was thus the witness of the heroic deeds of his lord, which he celebrated in an epic poem called *baudi*.

The aristocratic warriors of the heroic ages were thus members of an illustrious family, a link in a long chain of glorious heroes. And the chain could snap if the warrior failed to preserve the honour of the family, whereas, by earning fame through his own heroism, he could give it new lustre. Epic traditions were to a large extent the traditions of the aristocratic families: the Old French word *geste*, used for a form of epic that flourished in the Middle Ages, means not only a story of famous deeds but also a genealogy.

The passing of a heroic age does not necessarily mean the end of its heroic oral poetry. An oral epic tradition usually continues for as long as the nation remains largely illiterate. Usually it is after the heroic age has passed that the narratives about its legendary heroes are fully elaborated. Even when the nobility that originally created the heroic epic perishes or loses interest, the old songs can persist as entertainments among the people. Court singers, then, are replaced by popular singers, who recite at public gatherings. This popular tradition, however, must be distinguished from a tradition that still forms an integral part of the culture of a nobility. For when a heroic epic loses its contact with the banquet halls of the princes and noblemen, it cannot preserve for long its power of renewal. Soon it enters what has been called the reproductive stage in the life cycle of an oral tradition, in which the bards become noncreative reproducers of songs learned from older singers. Popular oral singers, like the *guslari* of the Balkans, no doubt vary their songs to a certain extent each time they recite them, but they do so mainly by transposing language and minor episodes from one acquired song to another. Such variations must not be confounded with the real enrichment of the tradition by succeeding generations of genuine oral poets of the creative stage. The spread of literacy, which has a disastrous effect on the oral singer, brings about a quick corruption of the tradition. At this degenerate stage, the oral epic soon dies out if it is not written down or recorded.

The popular tradition of the epic

The ancient Greek epic exemplifies the cycle of an oral tradition. Originating in the late Mycenaean period, the Greek epic outlasted the downfall of the typically heroic-age culture (*c.* 1100 BC) and maintained itself through the "Dark Age" to reach a climax in the Homeric poems by the close of the Geometric period (900–750 BC). After Homer, the activity of the *aoidoi*, who sang their own epic songs at the courts of the nobility, slowly declined. During the first half of the 7th century, the *aoidoi* produced such new poems as those of Hesiod and some of the earlier poems of what was to become known as the Epic Cycle. Between 625 and 575 BC the *aoidoi* gave way to oral reciters of a new type, called rhapsodes or "stitchers of songs," who declaimed for large audiences the already famous works of Homer while holding in their hand a staff (*rhabdos*), which they used to give emphasis to their words. It seems probable that these rhapsodes, who played a crucial role in the transmission of the Homeric epic, were using some sort of written aids to memory before Homeric recitations were adopted in 6th-century Athens as part of the Panathenaic festivals held each year in honour of the goddess Athena.

Verbal formulas. To compose and to memorize long narrative poems like the *Iliad* and the *Odyssey*, oral poets used a highly elaborate technical language with a large store of traditional verbal formulas, which could describe recurring ideas and situations in ways that suited the requirements of metre. So long as an oral epic tradition remains in its creative period, its language will be continually refined by each generation of poets in opposite directions, refinements that are called scope and economy. Scope is the addition of new phrases to express a larger number of recurrent concepts in varying metrical values fitting the possible positions in a verse. Economy is the elimination of redundancies that arise as gifted poets invent new set phrases that duplicate, both in a general sense and in metrical value, the formulas that already exist in the traditional stock.

Nowhere has this refinement proceeded any nearer to perfection than in the language of the Homeric epic. As has been shown by statistical analysis, it exhibits a remarkable efficiency, both in the rareness of unnecessarily duplicative variants and in the coverage of each common concept by the metrical alternatives useful in the composition of the six-foot metric line the Greeks used for epic poetry.

Thus, for example, if the idea of a ship has to be expressed at the end of a line of verse, the ship may be described as "well-trimmed" (*nēos eisēs*), "curved" (*nēos amphielissa*), or "dark-prowed" (*nēos kyanoprōiros*), depending entirely on the number of feet that remain to be filled by the phrase in the hexameter; if the phrase has to cover the two final feet of the verse and the words have to be put in the dative case, the formula "of a well-trimmed ship" will be replaced by "to a black ship" (*nēi melainē*). The sole occurrence of "Zeus who gathers lightning" (*steropēgereta Zeus*), which is an exact metrical equivalent of the more common "Zeus who delights in thunder" (*Zeus terpikeraunos*), constitutes one of the very few actual duplications of such formulas found in Homer.

Finally, some of the typical scenes in the heroic life, such as the preparation of a meal or sacrifice or the launching or beaching of a ship, contain set descriptions comprising several lines that are used by rote each time the events are narrated.

This highly formalized language was elaborated by generations of oral poets to minimize the conscious effort needed to compose new poems and memorize existing ones. Because of it, an exceptionally gifted *aoidos*, working just prior to the corruption of the genre, could orally create long and finely structured poems like the *Iliad* and the *Odyssey*, and those poems could then be transmitted accurately by the following generations of rhapsodes until complete written texts were produced.

BASES

Oral heroic poetry, at its origin, usually deals with outstanding deeds of kings and warriors who lived in the heroic age of the nation. Since the primary function of this poetry is to educate rather than to record, however, the personages are necessarily transformed into ideal heroes and their acts into ideal heroic deeds that conform to mythological or ideological patterns. Some of these patterns are archetypes found all over the world, while others are peculiar to a specific nation or culture. Thus, in many epic traditions, heroes are born as a result of an illegitimate union of a maiden mother with a divine or supernatural being; they are exposed at birth, fed by an animal, and brought up by humble foster parents in a rustic milieu; they grow up with marvellous speed, fight a dragon—in their first combat—to rescue a maiden whom

Heroic patterns and deeds

they marry, and die young in circumstances as fabulous as those that surrounded their birth.

In the traditions of Indo-European peoples a hero is often a twin, who acquires soon after his supernatural birth an invulnerability that has one defect, generally of his heel or of some other part of his foot, which ultimately causes his death. He is educated by a blacksmith, disguises himself as a woman at some time in his youth, and conquers a three-headed dragon, or some other kind of triple opponent, in his first battle. He then begets, by a foreign or supernatural woman, a child who, reared by his mother in her country, becomes a warrior as brave as his father. When this child meets his unknown father, the latter fails to recognize him, so that the father kills his own child after a long and fierce single combat. The hero, himself, usually dies after committing the third of three sins.

In Japan, to take another example, renowned members of the warrior aristocracy of the past, who have acquired the status of popular heroes, are in many cases supplied in their legend with four exceptionally brave and faithful retainers called their *shi-tennō*, the guardians of the four cardinal points; these form the closest entourage of their lord—who is usually depicted as excelling in command but not in physical strength—and defend him from dangers. The retainers reflect a mythological model, taken from Buddhism, of four *deva* kings, who guard the teaching of the Buddha against the attack of the devils.

A striking pattern for a number of epic traditions has been found in a so-called "tripartite ideology" or "trifunctional system" of the Indo-Europeans. The concept was based on the discovery of the remarkable philosophy of a prehistoric nation that survived as a system of thought in the historic Indo-European civilizations and even in the subconsciousness of the modern speakers of Indo-European tongues.

This philosophy sees in the universe three basic principles that are realized by three categories of people: priests, warriors, and producers of riches. In conformity with this philosophy, most Indo-European epics have as their central themes interaction among these three principles or functions which are: (1) religion and kingship; (2) physical strength; (3) fecundity, health, riches, beauty, and so forth. In the long Indian epic the *Mahābhārata*, for example, the central figures, the Pāṇḍava brothers, together with their father Paṇḍu, their two uncles Dhṛtarāṣṭra and Vidura, and their common wife, Draupadī, correspond to traditional deities presiding over the three functions of the Indo-European ideology.

Central themes of Indo-European epics

During the first part of their earthly career, the Pāṇḍava suffer constantly from the persistent enmity and jealousy of their cousins, Duryodhana and his 99 brothers, who, in reality, are incarnations of the demons Kālī and the Paulastya. The demons at first succeeded in snatching the Kingdom from the Pāṇḍava and in exiling them. The conflict ends in a devastating war, in which all the renowned heroes of the time take part. The Pāṇḍava survive the massacre, and establish on earth a peaceful and prosperous reign, in which Dhṛtarāṣṭra and Vidura also participate.

This whole story, it has been shown, is a transposition to the heroic level of an Indo-European myth about the incessant struggle between the gods and the demons since the beginning of the world. Eventually, it results in a bloody eschatological battle, in which the gods and the devils exterminate each other. The destruction of the former world order, however, prepares for a new and better world, exempt from evil influences, over which reign a few divine survivors of the catastrophe.

EARLY PATTERNS OF DEVELOPMENT

In the ancient Middle East. The earliest-known epic poetry is that of the Sumerians. Its origin has been traced to a preliterate Heroic Age, not later than 3000 BC, when the Sumerians had to fight, under the direction of a warlike aristocracy, for possession of this fertile Mesopotamian land. Among the extant literature of this highly gifted people are fragments of narrative poems recounting the heroic deeds of their early kings: Enmerkar, Lugalbanda, and Gilgamesh. By far the most important in the development of Mesopotamian literature are the five poems of the Gilgamesh cycle. This epic tells the odyssey of a king, Gilgamesh, part human and part divine, who seeks immortality. A god who dislikes his rule, fashions a wild man, Enkidu, to challenge him. Enkidu first lives among wild animals, then goes to the capital and engages in a trial of strength with Gilgamesh, who emerges victorious. The two, now friends, set out on various adventures, in one of which they kill a wild bull that the goddess of love had sent to destroy Gilgamesh because he spurned her marriage proposal. Enkidu dreams the gods have decided he must die for the death of the bull, and, upon awakening, he does fall ill and die. Gilgamesh searches for a survivor of the Babylonian flood to learn how to escape death. The survivor shows him where to find a plant that renews youth, but after Gilgamesh gets the plant it is snatched away by a serpent. Gilgamesh returns, saddened, to his capital.

The legend of Gilgamesh was taken over by the Babylonians, who developed it into a long and beautiful poem, one of the masterpieces of mankind.

The legend of Gilgamesh

Another Babylonian epic, composed around 2000 BC, is called in Akkadian *Enuma elish*, after its opening words, meaning "When on high." Its subject is not heroic but mythological. It recounts events from the beginning of the world to the establishment of the power of Marduk, the great god of Babylon. The outline of a Babylonian poem narrating the adventure of a hero named Adapa ("Man") can be reconstructed from four fragmentary accounts. It shares with the *Epic of Gilgamesh* the theme of man's loss of an opportunity for immortality.

Among clay tablets of the 14th century BC, covered with inscriptions in an old Phoenician cuneiform alphabet, from Ras Shamra (the site of ancient Ugarit), in northern Syria, there are important fragments of three narrative poems. One of these is mythological and recounts the career of the god Baal, which seems to coincide with the yearly cycle of vegetation on earth. As was usual with the death of gods in the ancient Mediterranean world, Baal's end brings about a drought that ceases only with his resurrection. Another fragment, about a hero named Aqhat, is perhaps a transposition of this myth of Baal to the human level. Just as the death of Baal is avenged on his slayer by Baal's sister Anath, so is the murder of Aqhat, which also causes a drought, revenged by his sister Paghat. Since the end of the poem is missing, however, it is not known whether Paghat, like Anath, succeeded in bringing her brother back to life.

The third fragment, the Ugaritic epic of Keret, has been interpreted as a Phoenician version of the Indo-European theme of the siege of an enemy city for the recovery of an abducted woman. This theme is also the subject of the Greek legend of the Trojan War and of the Indian epic *Rāmāyaṇa*. The fragmentary text does not reveal, however, whether the expedition of Keret, like that of the Achaean army against Troy, was meant to regain the hero's wife or to acquire for him a new bride.

The Greek epic. In its originative stage, especially, the Greek epic may have been strongly influenced by these oriental traditions. The Greek world in the late Bronze Age was related to the Middle East by so many close ties that it formed an integral part of the Levant. At Ugarit a large quarter of the city was occupied by Greek merchants, whose presence is also attested, among other places, at the gate of Mesopotamia, at Alalakh, in what is now Turkey. Thus, it is no surprise that, for example, the Greek myth about the succession of the divine kingship told in the *Theogony* of Hesiod and elsewhere is paralleled in a Hittite version of a Hurrian myth. In it, Anu, Kumarbi, and the storm god respectively, parallel Uranus, Cronos, and Zeus in the *Theogony*. The Hittites had continuous diplomatic relations with the Achaeans of Greece, whose princes went to the royal court at Hattusa to perfect their skill with the chariot. The Greeks, therefore, had ample opportunity to become familiar with Hittite myths.

Eastern influences on the Greek epic

The *Epic of Gilgamesh* was then well-known in the Levant, as is indicated by discoveries of copies of it throughout this wide area. Many parallels with the *Epic of Gilgamesh* have been pointed out in the *Odyssey*: the encounters of Odysseus with Circe and Calypso on their

mythical isles, for instance, closely resemble the visit by Gilgamesh to a divine woman named Siduri, who keeps an inn in a marvellous garden of the sun god near the shores of ocean. Like the two Greek goddesses, Siduri tries to dissuade Gilgamesh from the pursuit of his journey by representing the pleasures of life, but the firm resolution of the hero obliges her finally to help him cross the waters of death. In the *Iliad,* Patroclus, who dies as a substitute for his king and dearest friend, Achilles, and then gives Achilles a description of the miserable condition of man after his death, bears striking similarities to the friend of Gilgamesh, Enkidu.

The Greek heroic view of life

If these are indeed borrowings, it is all the more remarkable that they are used in Homer to express a view of life and a heroic temper radically different from those of the Sumerian epic of Mesopotamia. Gilgamesh persists in his quest of immortality even when Siduri shows him the vanity of such an ambition, but Odysseus shuns a goddess's offer of everlasting life, preferring to bear his human condition to the end. The loss of a beloved friend does not make Achilles seek desperately to escape from death; instead he rushes into combat to revenge Patroclus, although he knows that he is condemning himself to an early death, and that the existence of a king in Hades will be incomparably less enviable than that of a slave on earth. The Mesopotamian mind never tires of expressing man's deep regret at not being immortal through stories about ancient heroes who, despite their superhuman strength and wisdom, and their intimacy with gods, failed to escape from death. A decisively different idea, however, is fundamental to the Greek heroic view of life. It has been demonstrated that the Greek view is derived from an Indo-European notion of justice—that each being has a fate (*moira*) assigned to him and marked clearly by boundaries that should never be crossed. Man's energy and courage should, accordingly, be spent not in exceeding the proper limits of his human condition but in bearing it with style, pride, and dignity, gaining as much fame as he can within the boundaries of his *moira.* If he is induced by Folly (Ate, personified as a goddess of mischief) to commit an excess (*hybris*) with regard to his *moira,* he will be punished without fail by the divine vengeance personified as Nemesis.

At the beginning of the *Iliad,* a plague decimates the Achaean army because its commander in chief, Agamemnon, refuses to return a captive, Chryseis, to her father, a priest of Apollo who offers a generous ransom. By unjustly insulting Achilles, Agamemnon commits another excess that causes the defeat of his army. Achilles, in the meantime, lets Ate take possession of his mind and refuses, to the point of excess, to resume his fight. He thus brings about a great misfortune, the loss of his dearest companion, Patroclus. Patroclus, however, also contributes to his own death by his *hybris* in pushing his triumph too far, ignoring Achilles' order to come back as soon as he has repulsed the enemy far from the Greek ships. The death of Hector also results from his *hybris* in rejecting the counsel of Polydamas and maintaining his army on the plain after the return of Achilles to combat. After so many disasters caused by the mischievous action of Ate among men, the last book of the *Iliad* presents a noble picture of Priam and Achilles, who submit piously to the orders of Zeus, enduring with admirable courage and moderation their respective fates.

On the other hand, at the beginning of the *Odyssey,* Zeus evokes the ruin that Aegisthus will have to suffer for having acted "beyond his due share" by marrying Clytemnestra and murdering Agamemnon. This sets an antithesis to the story of the wise Odysseus, who, to accomplish his destiny as a mortal hero, never changes his purpose trying always to make the best of his countless misfortunes. He earns by this the favour of Athena and succeeds eventually in regaining Ithaca and punishing the wooers of Penelope for their *hybris* during his long absence. Present scholarship inclines to the view that such admirably well-structured poems as the *Iliad* and the *Odyssey* could have been created only by a single highly gifted poet whose name was Homer. This position contrasts with the extreme skepticism that marked all phases of Homeric criticism during the previous century. Yet the personality of Homer remains unknown and nothing certain is known about his life.

Hesiod's contribution

In comparison, information derived from his own works is fairly plentiful about the other great epic poet of Greece, Hesiod. He produced them presumably around 700 BC, while tilling a farm in Askra, a small village of Boeotia. The social and geographical background of his poems, called didactic because of their occasionally moral and instructive tone, differs from the aristocratic society of Ionian Asia Minor that Homer addressed. Despite their different style, subjects, and view of life, however, Hesiod's *Theogony* and the *Works and Days* illustrate the same basic conception of justice as the Homeric epic. The *Theogony* describes a long sequence of primordial events that resulted in the present world order, in which man's inescapable lot is assigned to him by Zeus. The *Works and Days* explains, through a series of three myths, why the lot of man is to work hard to produce riches. Man has to shut his ears to the goddess who causes wars and lawsuits, listening only to the goddess who urges him to toil more laboriously than his neighbour to become richer. Pain and suffering have become unavoidable since Pandora opened the fatal jar containing all the ills of mankind at Prometheus' house in conformity with the will of Zeus. Moreover, the age of the race of iron has arrived when the fate of human beings is not to pass their lives in perpetual banquets or warfare, as did the preceding races, but to suffer constantly the fatigue and misery of labour. As long as the goddesses Aidos (a personification of the sense of shame) and Nemesis (a personification of divine retribution) stay with mankind, however, helping people observe their *moira* without committing excesses, man can still gain riches, merits, and glory by the sweat of his brow. Only if he knows how to avoid all faults in doing his daily work will he not offend Justice (Dikē), the sensitive virgin daughter of Zeus. This is why it is so vitally important for a farmer to know all the rules listed in the rest of the poem about seemingly trivial details of his work.

LATER VARIATIONS

The Latin epic. Latin epic poetry was initiated in the 3rd century BC by Livius Andronicus, who translated the *Odyssey* into the traditional metre of Saturnian verse. It was not until the 1st century BC, however, that Rome possessed a truly national epic in the unfinished *Aeneid* of Virgil (70–19 BC), who used Homer as his model. The story of Aeneas' journey, recounted in the first six books, is patterned after the *Odyssey,* with many imitative passages and even direct translations, while the description of the war in the last six books abounds with incidents modelled after those from the *Iliad.* More basically, however, Virgil made use of another model, Rome's own national legend about the war fought under Romulus against the Sabines. This legend preserves, in a historical disguise, an original Indo-European myth about a primitive conflict between the gods of sovereignty and war and the gods of fecundity, ending with the unification of the two divine races. In the development of this theme by Virgil, Aeneas and the Etruscans can be seen as representing the gods of sovereignty and war, and the Latins representing the gods of fecundity. Aeneas, who has brought the Trojan gods to Rome, is forced to fight with the help of the Etruscans against the Latins. It is the destiny of Aeneas to rule, and it is the fate of the Latins to share their land and women with the invaders and to accept Aeneas as their king. This resembles the unification of the warring races that climaxes the Indo-European myth.

The persistence of the Indo-European pattern

The power exercised by the Indo-European ideological pattern on the Roman mind even under the empire is seen in the *Pharsalia* of Lucan (AD 39–65). In this historical epic, Cato, Caesar, and Pompey are depicted respectively as moral, warlike, and popular in a way that gives the story a clear trifunctional structure.

Germanic epics. A typical Heroic Age occurred during the wanderings of the Germanic tribes from the 3rd to the 6th centuries AD. Out of this, too, came a rich oral tradition, from which developed in the Middle Ages many epic poems. One of the greatest of these is the Old English

Beowulf, written down in the 8th century. Archetypal Indo-European themes also reappear in these epics. For example, the theme of the fatal fight between father and son is recounted in the German *Hildebrandslied*, of which a 67-line fragment is extant. Again, an heroic version of the Indo-European myth about the rescue of the Sun Maiden from her captivity by the Divine Twins, which also provided the basic plot of the Greek Trojan cycle and the Indian *Rāmāyaṇa*, is found in the German *Gudrun* (*c.* 1230).

Chansons de geste. The French chansons de geste are epic poems whose action takes place during the reign of Charlemagne and his immediate successors. The *Chanson de Roland*, probably written down about the end of the 11th century, is by far the most refined of the group. The story of the poem had developed from a historical event, the annihilation of the rear guard of Charlemagne's army at Roncesvalles in the Pyrenees in 778 by Basque mountaineers. The Basques, however, are transformed in the epic to the Saracens, who to a later generation typified France's enemies in Spain. The other chansons de geste, none of which is comparable to *Roland* as a literary work, have been classified into three main cycles. The cycle of Guillaume d'Orange forms a biography of William (probably a historical, count of William of Toulouse, who had, like the hero of the epic, a wife called Guibourg and a nephew, Vivien, and who became a monk in 806). Guibourg, the most faithful of wives, and the noble Vivien take prominent roles in the epic. The so-called Cycle of the Revolted Knights groups those poems that tell of revolts of feudal subjects against the emperor (Charlemagne or, more usually, his son, Louis). The Cycle of the King consists of the songs in which Charlemagne himself is a principal figure.

Arthurian Romance. The Arthurian Romance seems to have developed first in the British Isles, before being taken to the Continent by Bretons, who migrated to Brittany in the 6th and 7th centuries. The core of the legend about Arthur and his knights derives from lost Celtic mythology. Many of the incidents in the former parallel the deeds of such legendary Irish characters as Cú Chulainn, an Ulster warrior said to have been fathered by the god Lug, and Finn, hero of the Fenian cycle about a band of warriors defending Ireland, both of whom are gods transformed into human heroes. The earliest extant works on Arthurian themes are four poems of Chrétien de Troyes, written in French between 1155 and 1185: *Erec, Yvain, Le Chevalier de la Charette* (left unfinished by Chrétien and completed by Godefroy de Lagny), and an unfinished *Perceval*. In German, after 1188, Hartmann von Aue (who also wrote two legendary poems not belonging to the Arthurian cycle, *Gregorius* and *Poor Henry*) modelled his *Erec* and *Iwein* on those of Chrétien. The story of Perceval was given a full account by Wolfram von Eschenbach (*c.* 1170–1220) in his *Parzival* and in the unfinished *Titurel*. Another incomplete work of Wolfram, *Willehalm*, deals with the legend of William of Orange. *Tristan* of Gottfried von Strassburg is based directly on the older French version of Thomas of Britain (*c.* 1170–80). The romance proper, however, although it has similarities to the epic, differs in its lack of high purpose: fictions are told for their entertainment value rather than as models for national heroism. Developed in France in the Middle Ages, the romance is usually an adventure story with a strong love interest, intimately associated with the "courtly love" tradition of that time. (For further treatment, see below *Romance*.)

Distinctions between the epic and the romance

The epic in Japan. In Japan, there were in ancient times families of reciters (*katari-be*) whose duty was to hand down myths and legends by word of mouth and to narrate them during official ceremonies and banquets. After the introduction of Chinese letters, however, from the 4th century AD onward, these traditional tales were put in writing and the *katari-be* professional gradually died out. By the end of the 7th century, each clan of the ruling aristocracy seems to have possessed a written document that recounted the mythology and legendary history of Japan in a form biassed in favour of the clan concerned. These family documents were collected at the command of the emperor Temmu (672–686) and were used as basic materials for the compilation of the first national chronicles of Japan, the *Koji-ki* (712) and the *Nihon shoki* (720). The myths and legends that are contained in the earlier parts of these two books derive, therefore, from the oral tradition of *katari-be*. Although no document preserves those narrations in their primitive form, it is generally assumed that they were originally in the form of poems. Many scholars believe that they were genuine epic poems, which were produced during a period of incessant warfare around the 4th century. At that time mounted aristocratic warriors of the future imperial family struggled to extend its power over the larger part of Japan. Exploits of warriors, such as the emperor Jimmu or Prince Yamato-Takeru, in the earliest extant texts—the *Koji-ki* and *Nihon shoki* of the 8th century—probably derive from a heroic epic about the wars of conquest of the first emperors, whose legendary feats were transformed into those of a few idealized heroic figures.

The middle of the Heian period (794–1185) saw the emergence of a new class of warrior known as samurai. They attached a greater importance to fame than to life. The battles they fought became the subject of epic narratives that were recited by itinerant blind priests to the accompaniment of a lute-like instrument called a *biwa*.

Tales of the samurai

In the early part of the 13th century, tales about the wars of the preceding century, fought between the two strongest families of samurai, the Genji, or Minamoto, and the Heike, or Taira, were compiled in three significant war chronicles. The *Hōgen monogatari* and the *Heiji monogatari* deal with two small wars, the Hōgen (1156) and Heiji (1159), in which the Genji and Heike warriors fought for opposing court factions. The structure of the two works is roughly the same. Each celebrates the extraordinary prowess of a young Genji warrior, Minamoto Tametomo in the *Hōgen monogatari* and Minamoto Yoshihira in the *Heiji monogatari*; each hero fights to the finish in exemplary manner not so much to win, for from the beginning each foresees the defeat of his own side, as for the sake of fame; and the consummate courage of the two heroes forms a striking contrast to the cowardice of court aristocrats. The bitterly fought Gempei War (1180–85), in which survivors of the Genji family challenged and defeated the Heike, is recounted in detail in the *Heike monogatari*, the greatest epic of Japanese literature. The sudden decline and ultimate extinction of the proud Heike, whose members had held the highest offices of the imperial court, illustrates the Buddhist philosophy of the transitory nature of all things; it invites the readers to seek deliverance from the world of sufferings through a faith that will take them to a land of eternal felicity at the moment of their death. The work is filled with tales of heroic actions of brave warriors. The most conspicuous is Minamoto Yoshitsune, one of the chief commanders of the Genji army; the legend of this man of military genius continued to develop in later literature, so that he has become the most popular hero of Japanese legend.

The later written epic. The vitality of the written epic is manifested by such masterworks as the Italian *Divine Comedy* of Dante (1265–1321) and the great Portuguese patriotic poem *Os Lusíadas* of Luiz de Camões (1524–80), which celebrates the voyage of Vasco da Gama to India. In more recent times, novels and long narrative poems written by such major authors as Scott, Byron, Tennyson, William Morris, and Melville were patterned, to some extent, on the epic. Their fidelity to the genre, however, is found primarily in their large scope and their roots in a national soil; their distance from the traditional oral epic tends to be considerable.

Among the epics written in modern times, the Finnish *Kalevala* (first ed. 1835; enlarged ed. 1849) occupies a very special position. This is because its author, the Finnish poet-scholar Elias Lönnrot (1802–84), who composed this masterpiece by combining short popular songs (*runot*) collected by himself among the Finns, had absorbed his material so well and identified himself so completely with the *runo* singers. He thus came close to showing what the oral epic, which he could study only at its degenerative stage, might have been at its creative stage, on the lips of an exceptionally gifted singer. (A.Y.)

Fable, parable, and allegory

Fables, parables, and allegories are forms of imaginative literature or spoken utterance constructed in such a way that their readers or listeners are encouraged to look for meanings hidden beneath the literal surface of the fiction. A story is told or perhaps enacted whose details—when interpreted—are found to correspond to the details of some other system of relations (its hidden, allegorical sense). The poet, for example, may describe the ascent of a hill in such a way that each physical step corresponds to a new stage in the soul's progress toward a higher level of existence.

Many forms of literature elicit this kind of searching interpretation, and the generic term for the cluster is allegory; under it may be grouped fables, parables, and other symbolic shapings. Allegory may involve either a creative or an interpretive process: either the act of building up the allegorical structure and giving "body" to the surface narrative or the act of breaking down this structure to see what themes or ideas run parallel to it.

NATURE AND OBJECTIVES

Allegory and myth. The fate of allegory, in all its many variations, is tied to the development of myth and mythology. Every culture embodies its basic assumptions in stories whose mythic structures reflect the society's prevailing attitudes toward life. If the attitudes are disengaged from the structure, then the allegorical meaning implicit in the structure is revealed. The systematic discipline of interpreting the real meaning of a text (called the hermeneutic process) plays a major role in the teaching and defense of sacred wisdom, since religions have traditionally preserved and handed down the old beliefs by telling exemplary stories; these sometimes appear to conflict with a system of morality that has in the meantime developed, and so their "correct" meaning can only be something other than the literal narration of events. Every culture puts pressure on its authors to assert its central beliefs, which are often reflected in literature without the author's necessarily being aware that he is an allegorist. Equally, determined critics may sometimes find allegorical meaning in texts with less than total justification—instances might include the Hebraic–Christian mystical interpretation of the Old Testament's Song of Solomon, an erotic marriage poem, or the frequent allegorizing of classical and modern literature in the light of Freud's psychoanalytic discoveries. Some awareness of the author's intention seems necessary in order to curb unduly fanciful commentary.

The allegorical mode. The range of allegorical literature is so wide that to consider allegory as a fixed literary genre is less useful than to regard it as a dimension, or mode, of controlled indirectness and double meaning (which, in fact, all literature possesses to some degree). Critics usually reserve the term allegory itself for works of considerable length, complexity, or unique shape. Thus, the following varied works might be called allegories: the biblical parable of the sower; *Everyman,* the medieval morality play; *The Pilgrim's Progress,* by John Bunyan; Jonathan Swift's *Gulliver's Travels; The Scarlet Letter,* by Nathaniel Hawthorne; William Wordsworth's "Ode: Intimations of Immortality"; Nikolay Gogol's *Dead Souls; The Picture of Dorian Gray,* by Oscar Wilde; and the plays *Six Characters in Search of an Author,* by Luigi Pirandello; *Waiting for Godot,* by Samuel Beckett; and *Who's Afraid of Virginia Woolf?,* by Edward Albee. No one genre can take in such modal range.

Fable. Fable and parable are short, simple forms of naïve allegory. The fable is usually a tale about animals who are personified and behave as though they were humans. The device of personification is also extended to trees, winds, streams, stones, and other natural objects. The earliest of these tales also included humans and gods as characters, but fable tends to concentrate on animating the inanimate. A feature that isolates fable from the ordinary folktale, which it resembles, is that a moral—a rule of behaviour—is woven into the story.

Personification of animals

Parable. Like fable, the parable also tells a simple story. But, whereas fables tend to personify animal characters—often giving the same impression as does an animated cartoon—the typical parable uses human agents. Parables generally show less interest in the storytelling and more in the analogy they draw between a particular instance of human behaviour (the true neighbourly kindness shown by the good Samaritan in the Bible story, for example) and human behaviour at large. Parable and fable have their roots in preliterate oral cultures, and both are means of handing down traditional folk wisdom. Their styles differ, however. Fables tend toward detailed, sharply observed social realism (which eventually leads to satire), while the simpler narrative surface of parables gives them a mysterious tone and makes them especially useful for teaching spiritual values.

Derivation of the terms. The original meanings of these critical terms themselves suggest the direction of their development. Fable (from the Latin *fabula,* "a telling") puts the emphasis on narrative (and in the medieval and Renaissance periods was often used when speaking of "the plot" of a narrative). Parable (from Greek *parabolē,* a "setting beside") suggests a juxtaposition that compares and contrasts this story with that idea. Allegory (from Greek *allos* and *agoreuein,* an "other-speaking") suggests a more expanded use of deceptive and oblique language. (In early Greek, though, the term allegory itself was not used. Instead, the idea of a hidden, underlying meaning is indicated by the word *hyponoia*—literally, "underthought"—and this term is used of the allegorical interpretation of the Greek poet Homer.)

Diverse objectives. *Fable.* Fables teach a general principle of conduct by presenting a specific example of behaviour. Thus, to define the moral that "People who rush into things without using judgment run into strange and unexpected dangers," Aesop—the traditional "father" of the fable form—told the following story:

The moral objective of fables

> There was a dog who was fond of eating eggs. Mistaking a shell-fish for an egg one day, he opened his mouth wide and swallowed it down in one gulp. The weight of it in his stomach caused him intense pain. "Serve me right," he said, "for thinking that anything round must be an egg."

By a slight change of emphasis, the fabulist could have been able to draw a moral about the dangerous effects of gluttony.

Because the moral is embodied in the plot of the fable, an explicit statement of the moral need not be given, though it usually is. Many of these moral tag lines have taken on the status of proverb because they so clearly express commonly held social attitudes.

The Aesopian fables emphasize the social interactions of human beings, and the morals they draw tend to embody advice on the best way to deal with the competitive realities of life. With some irony, fables view the world in terms of its power structures. One of the shortest Aesopian fables says: "A vixen sneered at a lioness because she never bore more than one cub. 'Only one,' she replied, 'but a lion.' " Foxes and wolves, which the poet Samuel Taylor Coleridge called "Everyman's metaphor" for cunning and cruelty, appear often as characters in fables chiefly because, in the human world, such predatory cunning and cruelty are able to get around restraints of justice and authority. The mere fact that fables unmask the "beast in me," as James Thurber, the 20th-century American humorist and fabulist, put it, suggests their satirical force. Subversive topical satire in tsarist and Soviet Russia is often called "Aesopism"; all comic strips that project a message (such as the Charles Schulz creation "Peanuts" and Walt Kelly's "Pogo") have affinities with Aesop's method.

Parable. Parables do not analyze social systems so much as they remind the listener of his beliefs. The moral and spiritual stress of the form falls upon memory rather than on the critical faculty. The audience hearing the parable is assumed to share a communal truth but perhaps to have set it aside or forgotten it. The rhetorical appeal of a parable is directed primarily toward an elite, in that a final core of its truth is known only to an inner circle, however simple its narrative may appear on the surface (a number of the parables that Christ used for teaching, for example, conveyed figuratively the meaning of the elusive concept Kingdom of Heaven).

Allegory. Allegory, as the basic process of arousing in the reader or listener a response to levels of meaning, provides writers with the structure of fables, parables, and other related forms. By awakening the impulse to question appearances and by bringing order to mythological interpretation, allegory imparts cultural values. A measure of allegory is present in literature whenever it emphasizes thematic content, ideas rather than events. Generally, the allegorical mode flourishes under authoritarian conditions. Thus it found sustenance during the age of medieval Christendom, when Christian dogma sought universal sway over the mind of Western man. As such, allegory was a means of freedom under conditions of strong restraint. In general, realism, mimetic playfulness, and the resistance to authority tend to counteract the allegorical process, by loosening its stratified forms. This unbinding of symbolic hierarchies has forced allegory to seek new structures in the modern period. Nevertheless, through allegorical understanding, the great myths continue to be reread and reinterpreted, as the human significance of the new interpretations is passed down from one generation to the next. The abiding impression left by the allegorical mode is one of indirect, ambiguous, even enigmatic symbolism, which inevitably calls for interpretation.

Diversity of forms. Since an allegorical purpose can inform works of literature in a wide range of genres, it is not surprising to find that the largest allegories are epic in scope. A quest forms the narrative thread of both the Greek epic *Odyssey* and the Latin, *Aeneid*, and it is an allegory of the quest for heroic perfection; thus, allegory is aligned with the epic form. Romances, both prose and verse, are inevitably allegorical, although their forms vary in detail with the prevailing cultural ideals of the age. By comparison, the forms of fable and parable are relatively stable—yet even they may play down the moral idea or the mysterious element and emphasize instead the narrative interest, which then results in an elaboration of the form. (Such an elaboration may be seen in a given tale, as told by successive fabulists, such as a fable of the town mouse and the country mouse; with each retelling, the story is absorbed into a new matrix of interpretation.)

Shifts from naïve to sophisticated intent are accompanied by shifts in form. The early authors of fable, following Aesop, wrote in verse; but in the 10th century there appeared collected fables, entitled *Romulus*, written in prose (and books such as this brought down into the medieval and modern era a rich tradition of prose fables). This collection in turn was converted back into elegiac verse. Later masters of fable wrote in verse, but modern favourites—such as Joel Chandler Harris, author of "Uncle Remus" stories, Beatrix Potter, creator of Peter Rabbit, or James Thurber in *Fables for Our Time* —employ their own distinctive prose. Again, while for parables prose narrative may be the norm, they have also been told in verse (as in the emblematic poetry of the 17th-century English Metaphysical poets such as George Herbert, Francis Quarles, and Henry Vaughan).

Forms that mix prose and poetry

Loosening the allegorical forms further, some authors have combined prose with verse. Boethius' *Consolation of Philosophy* (*c.* AD 524) and Dante's *The New Life* (*c.* 1293) interrupt the prose discourse with short poems. Verse and prose then interact to give a new thematic perspective. A related mixing of elements appears in Menippean satire (those writings deriving from the 3rd-century-BC Cynic philosopher Menippus of Gadara), as exemplified in Swift's *Tale of a Tub*. There a relatively simple allegory of Reformation history (the *Tale* proper) is interrupted by a series of digressions that comment allegorically on the story into which they break.

Even the lyric poem can be adapted to yield allegorical themes and was made to do so, for example, in the visionary and rhapsodic odes written during the high Romantic period after the late 18th century throughout Europe.

The lesson seems to be that every literary genre is adaptable to the allegorical search for multiplicity of meaning.

Diversity of media. In the broadest sense, allegorical procedures are linguistic. Allegory is a manipulation of the language of symbols. Verbally, this mode underwent a major shift in medium along with the shift from oral to written literature: allegories that had initially been delivered in oral form (Christ's parables, for example) were written down by scribes and then transcribed by subsequent generations. Much more remarkable transformations, however, take place when the verbal medium is replaced by nonverbal or partially verbal media.

The drama is the chief of such replacements. The enactment of myth in the beginning had close ties with religious ritual, and in the drama of classical Greece both comedy and tragedy, by preserving ritual forms, lean toward allegory. Old Comedy, as represented by the majority of plays by Aristophanes, contains a curious blending of elements—allusions to men of the day, stories suggesting ideas other than the obvious literal sense, religious ceremony, parodies of the graver mysteries, personified abstractions, and stock types of character. Aeschylus' *Prometheus Bound* uses allegory for tragic ends, while Euripides' tragedies make a continuous interpretive commentary on the hidden meaning of the basic myths. Allegory is simplified in Roman drama, submitting heroic deeds to the control of the fickle, often malignant goddess Fortuna. Christian symbolism is responsible for the structure of the medieval morality plays, in which human dilemmas are presented through the conflicts of personified abstractions such as the "Virtues" and their "Vice" opponents. The allegory in Renaissance drama is often more atmospheric than structural—though even Shakespeare writes allegorical romances, such as *Cymbeline*, *Pericles*, and *The Winter's Tale* (and allowed his tragedy of *Coriolanus* to grow out of the "fable of the belly," which embodies a commonplace of Renaissance political wisdom and is recounted by one of the characters in the play). In 1598 Ben Jonson introduced the comedy of humours, which was dependent on the biological theory that the humours of the body (blood, phlegm, black bile, yellow bile) affect personality; in Jonson's play *Epicoene, or The Silent Woman* (1609), the character Morose is possessed by the demon of ill humour. Comic allegory of this kind evolved into the Restoration comedy of manners, and through that channel entered modern drama, with Wilde, Shaw, and Pirandello. Ibsen, the master of realistic drama, himself used a free-style allegory in *Peer Gynt*, while the surrealism of modern dramatists such as Ionesco, Genet, and Beckett serves to reinforce the real meaning of their plays.

The morality play

The degree to which the cinema has been allegorical in its methods has never been surveyed in detail. Any such survey would certainly reveal that a number of basic techniques in film montage builds up multiple layers of meaning. (Animated cartoons, too, continue the tradition of Aesopian fable.)

From time immemorial men have carved religious monuments and have drawn and painted sacred icons. Triumphal arches and chariots have symbolized glory and victory. Religious art makes wide use of allegory, both in its subject matter and in its imagery (such as the cross, the fish, the lamb). Even in poetry there can be an interaction of visual and verbal levels, sometimes achieved by patterning the stanza form. George Herbert's "Easter Wings," for instance, has two stanzas set out by the typographer to resemble the shape of a dove's wings. Such devices belong to the Renaissance tradition of the "emblem," which combines a motto with a simple symbolic picture (often a woodcut or engraving) and a concise explanation of the picture motto.

While allegory thrives on the visual, it has also been well able to embrace the empty form of pure mathematics. Number symbolism is very old; early Christian systems of cosmology were often based on the number three, referring to the doctrine of the Trinity (and in fact recalling earlier Hebraic and even Hellenic numerology). Musical symbolism has been discovered in the compositions of the 18th-century Baroque composers such as Johann Sebastian Bach. The most evanescent form of allegory, musical imagery and patterns, is also the closest to pure religious vision, since it merges the physical aspects of harmony (based on number) with the sublime and metaphysical effect on its hearers. The final extension of media occurs in the combination of spectacle, drama, dance, and music that is achieved by grand opera, which is at its most

The use of musical symbolism

allegorical in the total artwork of Richard Wagner in the second half of the 19th century. His *Ring* cycle of operas is a complete mythography and allegory, with words and music making two levels of meaning and the whole unified by a type of musical emblem, which Wagner called the leitmotif.

Allegory and cosmology. The allegorical mode has been of major importance in representing the cosmos: the earliest Greek philosophers, for example, speculated on the nature of the universe in allegorical terms; in the Old Testament's oblique interpretation of the universe, too, the world is seen as a symbolic system. The symbolic stories that explain the cosmos are ritualized to ensure that they encode a message. Held together by a system of magical causality, events in allegories are often surrounded by an occult atmosphere of charms, spells, talismans, genies, and magic rites. Science becomes science fiction or a fantastic setting blurs reality so that objects and events become metamorphically unstable. Allegorical fictions are often psychological dramas whose scene is the mind; then their protagonists are personified mental drives. Symbolic climate is most prominent in romance, whose heroic quests project an aura of erotic mysticism, perfect courtesy, and moral fervour that creates a sublime heightening of tone and a picturesque sense of good order.

The cosmic and demonic character of allegorical thinking is most fully reflected in the period of its greatest vogue, the High Middle Ages. During this period poets and priests alike were able to read with increasingly elaborate allegorical technique until their methods perhaps overgrew themselves. A belief had been inherited in the "Great Chain of Being," the Platonic principle of cosmic unity and fullness, according to which the lowest forms of being were linked with the highest in an ascending order. On the basis of this ladderlike conception were built systems of rising transcendency, starting from a material basis and rising to a spiritual pinnacle. The early Church Fathers sometimes used a threefold method of interpreting texts, encompassing literal, moral, and spiritual meanings. This was refined and commonly believed to have achieved its final form in the medieval allegorist's "fourfold theory of interpretation." This method also began every reading with a search for the literal sense of the passage. It moved up to a level of ideal interpretation in general, which was the allegorical level proper. (This was an affirmation that the true Christian believer was right to go beyond literal truth.) Still higher above the literal and the allegorical levels, the reader came to the tropological level, which told him where his moral duty lay. Finally, since Christian thought was apocalyptic and visionary, the fourfold method reached its apogee at the anagogic level, at which the reader was led to meditate on the final cosmic destiny of all Christians and of himself as a Christian hoping for eternal salvation.

The "fourfold theory of interpretation"

While modern scholars have shown that such thinking played its part in the poetry of the Middle Ages and while the Italian poet Dante himself discussed the theological relations between his poems and such a method of exegesis, the main arena for the extreme elaboration of this allegory was in the discussion and the teaching of sacred Scriptures. As such, the fourfold method is of highest import, and it should be observed that it did not need to be applied in a rigid four-stage way. It could be reduced, and commonly was reduced, to a two-stage method of interpretation. Then the reader sought simply a literal and a spiritual meaning. But it could also be expanded. The passion for numerology, combined with the inner drive of allegory toward infinite extension, led to a proliferation of levels. If four levels were good, then five or eight or nine might be better.

HISTORICAL DEVELOPMENT IN WESTERN CULTURE

Fable. The origins of fable are lost in the mists of time. Fables appear independently in ancient Indian and Mediterranean cultures. The Western tradition begins effectively with Aesop (6th century BC), of whom little or nothing is known for certain; but before him the Greek poet Hesiod (8th century BC) recounts the fable of the hawk and the nightingale, while fragments of similar tales survive in Archilochus, the 7th-century-BC warrior-poet. Within 100 years of the first Aesopian inventions the name of Aesop was firmly identified with the genre, as if he, not a collective folk, were its originator. Like the Greek philosopher Socrates, Aesop was reputed to have been ugly but wise. Legend connected him with the island of Samos; the historian Herodotus believed him to have been a slave.

Modern editions list approximately 200 "Aesop" fables, but there is no way of knowing who invented which tales or what their original occasions might have been. Aesop had already receded into legend when Demetrius of Phaleron, a rhetorician, compiled an edition of Aesop's fables in the 4th century BC. The poetic resources of the form developed slowly. A versified Latin collection made by Phaedrus, a freed slave in the house of the Roman emperor Augustus, included fables invented by the poet, along with the traditional favourites, which he retold with many elaborations and considerable grace. (Phaedrus may also have been the first to write topically allusive fables, satirizing Roman politics.) A similar extension of range marks the work of the Hellenized Roman Babrius, writing in the 2nd century AD. Among the classical authors who advanced upon Aesopian formulas may be named the Roman poet Horace, the Greek biographer Plutarch, and the great satirist Lucian of Samosata.

Beast epic. In the Middle Ages, along with every other type of allegory, fable flourished. Toward the end of the 12th century, Marie de France made a collection of over 100 tales, mingling beast fables with stories of Greek and Roman worthies. In another compilation, Christine de Pisan's Othéa manuscript illuminations provide keys to the interpretation of the stories and support the appended moral tag line. Expanded, the form of the fable could grow into what is called the beast epic, a lengthy, episodic animal story, replete with hero, villain, victim, and endless epic endeavour. (One motive for thus enlarging upon fable was the desire to parody epic grandeur: the beast epic mocks its own genre.) Most famous of these works is a 12th-century collection of related satirical tales called *Roman de Renart,* whose hero is a fox, symbolizing cunning man. The *Roman* includes the story of the fox and Chantecler (Chanticleer), a cock, a tale soon afterward told in German, Dutch, and English versions (in *The Canterbury Tales,* Geoffrey Chaucer took it as the basis for his "Nun's Priest's Tale"). Soon the *Roman* had achieved universal favour throughout Europe. The Renaissance poet Edmund Spenser also made use of this kind of material; in his "Mother Hubberd's Tale," published in 1591, a fox and an ape go off to visit the court, only to discover that life is no better there than in the provinces. More sage and serious, John Dryden's poem of *The Hind and Panther* (1687) revived the beast epic as a framework for theological debate. Bernard de Mandeville's *Fable of the Bees* (first published 1705 as *The Grumbling Hive, or Knaves Turn'd Honest*) illustrated the rapacious nature of humans in society through the age-old metaphor of the kingdom of the bees. In modern times, children's literature has made use of animal fable but often trivialized it. But the form has been taken seriously, as, for example, by the political satirist George Orwell, who, in his novel *Animal Farm* (1945), used it to attack Stalinist Communism.

Tales of the cunning fox

Influence of Jean de La Fontaine. The fable has normally been of limited length, however, and the form reached its zenith in 17th-century France, at the court of Louis XIV, especially in the work of Jean de La Fontaine. He published his *Fables* in two segments: the first, his initial volume of 1668, and the second, an accretion of "Books" of fables appearing over the next 25 years. The 1668 *Fables* follow the Aesopian pattern, but the later ones branch out to satirize the court, the bureaucrats attending it, the church, the rising bourgeoisie—indeed the whole human scene. La Fontaine's great theme was the folly of human vanity. He was a skeptic, not unkind but full of the sense of human frailty and ambition. His satiric themes permitted him an enlargement of poetic diction; he could be eloquent in mocking eloquence or in contrast use a severely simple style. (His range of tone and style has been admirably reflected in a version of his works made by a

20th-century American poet, Marianne Moore.) La Fontaine's example gave new impetus to the genre throughout Europe, and during the Romantic period a vogue for Aesopian fable spread to Russia, where its great practitioner was Ivan Andreyevich Krylov. The 19th century saw the rise of literature written specifically for children, in whom fable found a new audience. Among the most celebrated authors who wrote for them are Lewis Carroll, Charles Kingsley, Rudyard Kipling, Kenneth Grahame, Hilaire Belloc, and Beatrix Potter. There is no clear division between such authors and the "adult" fabulist, such as Hans Christian Andersen, Lewis Carroll, Oscar Wilde, Saint-Exupéry, or J.R.R. Tolkien. In the 20th century there are the outstanding *Fables for Our Time*, written by James Thurber and apparently directed toward an adult audience (although a sardonic parent might well read the *Fables* to his children).

Parable. In the West, the conventions of parable were largely established by the teachings of Christ. The New Testament records a sufficient number of his parables, with their occasions, to show that to some extent his disciples were chosen as his initiates and followers because they "had ears to hear" the true meaning of his parables. (It has already been noted that the parable can be fully understood only by an elite, made up of those who can decipher its inner core of truth.) Despite a bias toward simplicity and away from rhetorical elaboration, the parable loses little in the way of allegorical richness: the speaker can exploit an enigmatic brevity that is akin to the style of presenting a complex riddle. Parable is thus an immensely useful preaching device: while theologians in the period of the early Christian Church were developing glosses on Christ's enigmatic stories, preachers were inventing their own to drive home straightforward lessons in good Christian conduct. For centuries, therefore, the model of parable that had been laid down by Christ flourished on Sundays in churches all over the Western world. Pious tales were collected in handbooks: the *Gesta Romanorum*, the *Alphabet of Thales*, the *Book of the Knight of La Tour Landry*, and many more. Infinitely varied in subject matter, these exemplary tales used a plain but lively style, presenting stories of magicians, necromancers, prophets, chivalrous knights and ladies, great emperors—a combination bound to appeal to congregations, if not to theologians. An important offshoot of the parable and exemplary tale was the saint's life. Here, too, massive compilations were possible; the most celebrated was *The Golden Legend* of the 15th century, which included approximately 200 stories of saintly virtue and martyrdom.

20th-century parables

As long as preaching remained a major religious activity, the tradition of parable preserved its strong didactic strain. Its more paradoxical aspect gained renewed lustre in theological and literary spheres when the 19th-century Danish philosopher Soren Kierkegaard began to use parables in his treatises on Christian faith and action. In *Fear and Trembling* he retold the story of Abraham and Isaac; in *Repetition* he treated episodes in his own life in the manner of parable. Such usage led to strange new literary forms of discourse, and his writing influenced, among others, the Austro-Czech novelist Franz Kafka and the French "absurdist" philosopher, novelist, and playwright Albert Camus. Kafka's parables, full of doubt and anxiety, mediate on the infinite chasm between man and God and on the intermediate role played by the law. His vision, powerfully expressed in parables of novel length (*The Castle, The Trial, Amerika*), is one of the most enigmatic in modern literature.

Allegory. The early history of Western allegory is intricate and encompasses an interplay between the two prevailing world views—the Hellenic and the Hebraic–Christian—as theologians and philosophers attempted to extract a higher meaning from these two bodies of traditional myth.

In terms of allegory, the Greco-Roman and Hebraic–Christian cultures both have a common starting point: a creation myth. The Old Testament's book of Genesis roughly parallels the story of the creation as told by the Greek poet Hesiod in his *Theogony* (and the later Roman version of the same event given in Ovid's *Metamorphoses*). The two traditions thus start with an adequate source of cosmic imagery, and both envisage a universe full of mysterious signs and symbolic strata. But thereafter the two cultures diverge. This is most apparent in the way that the style of the body of poetry attributed to Homer—the ancient Greek "Bible"—differs from the Old Testament narrative. The Greek poet presented his heroes against an articulated narrative scene, a context full enough for the listener (and, later, the reader) to ignore secondary levels of significance. By contrast, the Jewish authors of the Old Testament generally emptied the narrative foreground, leaving the reader to fill the scenic vacuum with a deepening, thickening allegorical interpretation.

Old Testament. The Old Testament, including its prophetic books, has a core of historical record focussing on the trials of the tribes of Israel. In their own view an elect nation, the Israelites believe their history spells out a providential design. The prophets understand the earliest texts, Genesis and Exodus, in terms of this providential scheme. Hebraic texts are interpreted as typological: that is, they view serious myth as a theoretical history in which all events are types—portents, foreshadowing the destiny of the chosen people. Christian exegesis (the critical interpretation of Scripture) inherits the same approach.

Typological allegory

Typological allegory looks for hidden meaning in the lives of actual men who, as types or figures of later historical persons, serve a prophetic function by prefiguring those later persons. Adam, for example (regarded as a historical person), is thought to prefigure Christ in his human aspect, Joshua to prefigure the victorious militant Christ. This critical approach to Scripture is helped by the fact of monotheism, which makes it easier to detect the workings of a divine plan. The splendours of nature hymned in the Psalms provide a gloss upon the "glory of God." The Law (the Torah) structures the social aspect of sacred history and, as reformulated by Christ, provides the chief link between Old and New Testaments. Christ appeals to the authority of "the Law and the Prophets" but assumes the ultimate prophetic role himself, creating the New Law and the New Covenant—or Testament—with the same one God of old.

The Greeks. Hellenic tradition after Homer stands in sharp contrast to this concentration on the fulfilling of a divine plan. The analytic, essentially scientific histories of Herodotus and Thucydides precluded much confident belief in visionary providence. The Greeks rather believed history to be structured in cycles, as distinct from the more purposive linearity of Hebraic historicism.

Nevertheless, allegory did find a place in the Hellenic world. Its main arena was in philosophic speculation, centring on the interpretation of Homer. Some philosophers attacked and others defended the Homeric mythology. A pious defense argued that the stories—about the monstrous love affairs of the supreme god Zeus, quarrels of the other Olympian gods, scurrility of the heroes, and the like—implied something beyond their literal sense. The defense sometimes took a scientific, physical form; in this case, Homeric turmoil was seen as reflecting the conflict between the elements. Or Homer was moralized; the goddess Pallas Athene, for example, who in physical allegory stood for the ether, in moral allegory was taken to represent reflective wisdom because she was born out of the forehead of her father, Zeus. Moral and physical interpretation is often intermingled.

Plato, the Idealist philosopher, occupies a central position with regard to Greek allegory. His own myths imply that our world is a mere shadow of the ideal and eternal world of forms (the Platonic ideas), which has real, independent existence, and that the true philosopher must therefore be an allegorist in reverse. He must regard phenomena—things and events—as a text to be interpreted upward, giving them final value only insofar as they reveal, however obscurely, their ideal reality in the world of forms. Using this inverted allegorical mode, Plato attacked Homeric narrative, whose beauty beguiles men into looking away from the truly philosophic life. Plato went further. He attacked other fashionable philosophic allegorists because they did not lead up to the reality but limited speculation to the sphere of moral and physical necessity. Platonic

allegory envisaged the system of the universe as an ascending ladder of forms, a "Great Chain of Being," and was summed up in terms of myth in his *Timaeus*. Plato and Platonic thought became, through the influence of this and other texts on Plotinus (died 269/270) and through him on Porphyry (died *c.* 304), a pagan mainstay of later Christian allegory. Medieval translations of Dionysius the Areopagite (before 6th century AD) were equally influential descendants of Platonic vision.

Stoic allegory

A second and equally influential Hellenic tradition of allegory was created by the Stoic philosophers, who held that the local gods of the Mediterranean peoples were signs of a divinely ordered natural destiny. Stoic allegory thus emphasized the role of fate, which, because all men were subject to it, could become a common bond between peoples of different nations. A later aspect of moral exegesis in the Stoic manner was the notion that myths of the gods really represent, in elevated form, the actions of great men. In the 2nd century BC, under Stoic influence, the Sicilian writer Euhemerus argued that theology had an earthly source. His allegory of history was the converse of Hebraic typology—which found the origin of the divine in the omnipotence of the One God—for Euhemerus found the origin of mythological gods in human kings and heroes, divinized by their peoples. His theories enjoyed at least an aesthetic revival during the Renaissance.

Blending of rival systems: the Middle Ages. At the time of the birth of Christ, ideological conditions within the Mediterranean world accelerated the mingling of Hellenic and Hebraic traditions. Philo Judaeus laid the groundwork; Clement of Alexandria and Origen followed him. The craft of allegorical syncretism—that is, making rival systems accommodate one another through the transformation of their disparate elements—was already a developed art by the time St. Paul and the author of the Gospel According to St. John wove the complex strands of the Hebraic–Christian synthesis. Over centuries of quarrelling, the timeless philosophy of the Greek allegorists was accommodated to the time-laden typology of the Hebrew prophets and their Christian successors and at length achieved a hybrid unity that permitted great allegories of Western Christendom to be written.

As a hybrid method, allegory could draw on two archetypal story lines: the war and the quest of Homer's *Iliad* and *Odyssey*, which was paralleled by the struggles and wanderings of the children of Israel. Throughout the Middle Ages the figure of the wandering Aeneas (who, in the second half of Virgil's Latin epic, *Aeneid*, fought bloody battles) was seen as a type in a system of hidden Christianity. Virgil's fourth *Eclogue*, a prophetic vision of the birth of a child who would usher in the "golden age," was read as a prophecy of the birth of Christ. Seen by many Christian commentators as the ideal allegorist, Virgil himself was hailed as a proto-Christian prophet. The blending of rival systems of allegory from widely assorted cultures became the rule for later allegory. Adapting the Latin writer Apuleius' fable of Cupid and Psyche, Edmund Spenser combined its elements with ancient Middle Eastern lore, Egyptian wisdom, and dashes of Old Testament critical interpretation to convert the enclosed garden of the biblical Song of Solomon into the gardens of Adonis in *The Faerie Queene*, Book III. The pagan gods survived unharmed throughout the Middle Ages if wearing Christian costumes, because Christians were taught that pagan worthies could be read as figures of Christian rulers. The labours of Hercules, for instance, stood for the wanderings and trials of all Christian men; the Hellenic theme of heroic warfare took a Christianized form, available to allegory, when in the 4th century the poet and hymn writer Prudentius internalized war as the inner struggle of Christian man, suspended between virtue and vice. For complete triumph in explaining the significance of the world, Christianity needed one further element: a world-historical theory large enough to contain all other theories of meaning. This it found in the belief that God was the author of the world. His creation wrote the world. The world, read as a text, provided a platform for transforming the piecemeal, postclassical syncretism into some semblance of order. Firmly established in the West, Christianity, for all its strains of discord, slowly achieved a measure of coherence. St. Thomas Aquinas could write its *Summa*. Theocentric, authoritarian, spiritualist, and word oriented, the medieval model of allegory lent itself to the creation of the most wonderful of all allegorical poems, Dante's *Divine Comedy*, completed shortly before his death in 1321.

The importance of the Christian world view in allegory

Before this could happen, however, the Christian world view had been subjected to an important pressure during the 12th century. It may be called the pressure to externalize. Alanus de Insulis (Alain de Lille), Bernard of Sylvestris, John of Salisbury, and other forerunners of the movement known as European Humanism "discovered" nature. Delighting in the wonders of God's cosmic text, they brought theological speculation down to earth. Romances of love and chivalry placed heroes and heroines against the freshness of spring. Everywhere nature shone, sparkling with the beauty of earthly life. The externalization and naturalizing of Christian belief flowers most obviously in *The Romance of the Rose*, begun in the 13th century by Guillaume de Lorris and completed, in vastly complicated form, by Jean de Meung. The *Romance* personifies the experiences of courtly love, recounting the pursuit of an ideal lady by an ideal knight, set in an enclosed garden and castle, which permits Guillaume to dwell on the beauty of nature. With Jean de Meung the interest in nature is made explicit, and the poem ends in a series of lengthy digressive discourses, several of them spoken by Dame Nature herself. In medieval English poetry this same love of spring and seasonal pleasures is apparent everywhere—certainly in the poems of Geoffrey Chaucer, who, besides creating several allegories of his own, translated *The Romance of the Rose* into English.

Dante's *Divine Comedy* has physical immediacy and contains an immense amount of historical detail. He anchors his poem in a real world, accepting Christian typology as historical fact and adopting an ordered system of cosmology (based on the number three, proceeding from the Trinity). Dante's passion for numerology does not, however, block a closeness to nature that had perhaps not been equalled in poetry since Homer. He enfolds classical thought into his epic by making Virgil one of its main protagonists—again to prefigure Christian heroism. Perhaps only William Langland, the author of *The Vision of Piers Plowman*, could be said to rival Dante's cosmic range. *Piers Plowman* is a simpler apocalyptic vision than the *Comedy*, but it has an existential immediacy, arising from its concern for the poor, which gives it great natural power.

Renaissance. Romance and romantic forms provide the main vehicle for the entrance of allegory into the literature of the Renaissance period. The old Arthurian legends carry a new sophistication and polish in the epics of the Italians Boiardo, Ariosto, and Tasso and in the work of Edmund Spenser. By interlacing several simultaneous stories in one larger narrative, the literary technique known as *entrelacement* allowed digression—yet kept an ebbing, flowing kind of unity—while presenting opportunities for moral and ironic commentary. But although the forms and themes of romance were medieval in origin, the new age was forced to accommodate altered values. The Middle Ages had externalized the Christian model; the Renaissance now internalized it, largely by emphasizing the centrality of human understanding. This process of internalization had begun slowly. In rough outline it can be discerned in the belief that biological humours affected personality, in the adaptations of Platonic idealism from which arose a new emphasis on imagination, in the rise of an introspective, soliloquizing drama in England. It can further be discerned in the gradual adoption of more self-conscious theories of being: Shakespeare's Hamlet, finding himself by thinking out his situation, prefigures the first modern philosopher, René Descartes, whose starting point for argument was "I think, therefore I am." Christopher Marlowe's characterization of Dr. Faustus epitomizes the new age. Pursuing power in the form of knowledge, he is led to discover the demons of allegory within himself. He is an essential figure for later European literature, archetypal in Germany for both Johann Wolfgang von Goethe and Thomas Mann and influential everywhere.

Modern period. With the Baroque and Neoclassical periods, allegory began to turn away from cosmology and toward rhetorical ambiguity. John Milton allegorized sin and death in his epic poem *Paradise Lost*, but allegory for him seems chiefly to lie in the ambiguous diction and syntax employed in the poem. Instead of flashing allegorical emblems before the reader, Milton generates a questioning attitude that searches out allegory more as a mysterious form than a visible content. His central allegorical theme is perhaps the analogy he draws between poetry, music, and ideas of cosmic order. This theme, which generates allegory at once, recurs in later English poetry right up to modern times with T.S. Eliot's *Four Quartets*.

Milton's allegory: *Paradise Lost*

The social and religious attitudes of the 18th-century age of Enlightenment could be expressed coolly and without ambiguity—and thus there was little need for spiritual allegory in the period's literature. Oblique symbolism was used mainly for satirical purposes. John Dryden and Alexander Pope were masters of verse satire, Jonathan Swift of prose satire. Voltaire and the French writers of the Enlightenment similarly employed a wit whose aim was to cast doubt on inherited pieties and attitudes. A new vogue for the encyclopaedia allowed a close, critical commentary on the ancient myths, but the criticism was rationalist and opposed to demonology. Under such conditions the allegorical mode might have dried up entirely. Yet the new Romantic age of the late 18th and early 19th centuries revived the old cosmologies once more, and poetic forms quickly reflected the change, with the Romantic poets and their precursors (Blake, William Collins, Edward Young, Thomas Gray, and others) managing to reinstate the high destiny of the allegorical imagination. The Romantics went back to nature. Poets took note of exactly what they saw when they went out walking, and their awareness of nature and its manifestations found its way into their poetry. Appropriate poetic forms for expressing this sensibility tended to be open, rhapsodic, and autobiographical—qualities notably present in William Wordsworth and in Samuel Taylor Coleridge, for example. Percy Bysshe Shelley is the most strikingly allegorical of English Romantics; he not only followed the Platonic tradition of Spenser and the Renaissance—with ode, elegy, and brief romance—but he also invented forms of his own, such as *Epipsychidion*, a rhapsodic meditation, and he was working on a great Dantesque vision, *The Triumph of Life*, when he died. Visionary masterpieces came from Germany, where Novalis and Friedrich Hölderlin hymned the powers of nature in odes of mythic overtone and resonance. French Romanticism, merging gradually with the theory and practice of the Symbolist movement (dealing in impressions and intuitions rather than in descriptions), in turn followed the same path. The pantheist cosmology of Victor Hugo, the central writer of the somewhat delayed French Romantic movement, created an allegory of occult forces and demonic hero worship. It is fair to say that, in its most flexible and visionary forms, allegory flourished throughout the Romantic period.

There also developed a novelistic mode of allegory by which prose authors brought fate, necessity, the demonic, and the cosmological into their narratives. Émile Zola used a theory of genetics, Charles Dickens the idea of ecological doom, Leo Tolstoy the belief in historical destiny, and Fyodor Dostoyevsky the fatalism of madness and neurosis. Nikolay Gogol revived the art of the grotesque, picturing absurdities in the scene of tsarist Russia. Even the arch-naturalist playwright, Anton Chekhov, made an emblem of the cherry orchard and the sea gull in his plays of those titles. However its dates are established, the modern period is exceedingly complex in its mythmaking. Psychoanalytic theory has been both a critical and a creative resource; modern allegory has remained internalized in the Renaissance tradition. But Marxist social realism has kept to the externals of dialectical materialism, though without notable aesthetic success. In the free play of American letters, where Nathaniel Hawthorne, Herman Melville, Edgar Allen Poe, and Henry James (particularly in his later novels) had essayed an allegorical mode, the future of its use is uncertain. T.S. Eliot's enigmatic style in a long poem, "Ash Wednesday," may be related to his search for a Dantesque dramatic style, for which he also tried in plays, most obviously *Murder in the Cathedral* (a morality) and *The Cocktail Party* (a philosophic farce). More clearly popular authors such as George Orwell and William Golding have used the most familiar allegorical conventions. D.H. Lawrence shaped novels such as *The Plumed Serpent* to project a thematic, cultural polemic. W.H. Auden's operatic librettos reflect once more the allegorical potential of this mixture of media.

Complexity of mythmaking in the 20th century

Modern allegory has in fact no set pattern, or model, although Surrealism has provided a dominant style of discontinuous fragmentary expression. The only rule seems to be that there is no rule. Science fiction, an ancient field dating back at least to the earliest philosophers of Greece, has set no limits on the speculations it will entertain. The allegorical author now even questions the allegorical process itself, criticizing the very notions of cosmos, demon, and magic. It may be that modern allegory has completed a vast circle begun by the first conflict between ways of interpreting myth, as revealed in Homer and the Hebraic prophets.

(A.S.F.)

ALLEGORICAL LITERATURE IN THE EAST

India. Fables appeared early in India, but it is impossible to determine whether they are older or later than the Greek. Undoubtedly there was mutual influence from very early times, for indirect contacts between Greece and India (by trade routes) had existed long before the time of Alexander the Great. In the form in which they are now known the Greek fables are the older, but this may be an accident of transmission.

The fable was apparently first used in India as a vehicle of Buddhist instruction. Some of the *Jātakas*, birth stories of the Buddha, which relate some of his experiences in previous animal incarnations, resemble Greek fables and are used to point a moral. They may date from as far back as the 5th century BC, though the written records are much later. The most important compilation is the *Pañcatantra*, a Sanskrit collection of beast fables. The original has not survived, but it has been transmitted (via a lost Pahlavi version) as the mid-8th-century Arabic *Kalīlah wa Dimnah*. Kalilah and Dimnah are two jackals, counselors to the lion king, and the work is a frame story containing numerous fables designed to teach political wisdom or cunning. From the Arabic this was translated into many languages, including Hebrew, which version John of Capua used to make a Latin version in the 13th century. This, the *Directorium humanae vitae* ("Guide for Human Life"), was the chief means by which oriental fables became current in Europe. In the fables of Bidpai, animals act as men in animal form, and little attention is paid to their supposed animal characteristics. It is in this respect that they differ most from the fables of Aesop, in which animals behave as animals.

(Ed.)

China. Chinese philosophers from the Ch'in dynasty (221–206 BC) onward often used extended metaphors (from which fable is the logical development) to make their points. This is believed to reflect the fact that, as "realistic" thinkers, the Chinese generally did not favour more abstract argument. Thus simple allegory helped to stimulate audience interest and to increase the force of an argument. A century earlier, Mencius, a Confucian philosopher, had used the following little allegory in illustrating his theory that an effort has to be made if man's natural goodness is to be recovered: "A man will begin searching when his dog or chicken is missing; but he does not go searching for the good character he was born with after it is lost. Is this not regrettable?" The same writer also used a parable to bring home his point that mental training could not be hurried, but was a gradual process: "A man in Sung sowed seeds in a field. The seedlings grew so slowly, however, that one day he took a walk through the field pulling at each one of the seedlings. On returning home he announced that he was exhausted, but that he had helped the seedlings' growth. His son, hurrying to the field, found the seedlings dead."

Tales such as this were often borrowed from folklore,

but others were probably original creations, including a striking story that opens the *Chuang-tzu,* a summa of Taoist thought. It makes the point that ordinary people frequently deplore the actions of a man of genius because they are unable to understand his vision, which is not answerable to the laws of "common sense": "A giant fish, living at the northern end of the world, transformed itself into a bird so that it could make the arduous flight to the southernmost sea. Smaller birds, measuring his ambition against their own capabilities, laughed at the impossibility of it."

But the full development of fable, as it is understood in the West, was hindered by the fact that Chinese ways of thinking prohibited them from accepting the notion of animals that thought and behaved as humans. Actual events from the past were thought to be more instructive than fictitious stories, and this led to the development of a large body of legendary tales and supernatural stories. Between the 4th and 6th centuries, however, Chinese Buddhists adapted fables from Buddhist India in a work known as *Po-Yü ching,* and they also began to make use of traditional Chinese stories that could further understanding of Buddhist doctrines. (Na.Mo.)

Japan. In Japan, the *Kojiki* (712; "Records of Ancient Matters") and the *Nihon-shoki* (8th century, "Chronicles of Japan"), both of them official histories of Japan, were studded with fables, many of them on the theme of a small intelligent animal getting the better of a large stupid one. The same is true of the *fudoki* (local gazetteers dating from 713 and later). The form reached its height in the Kamakura period (1192–1333). Toward the end of the Muromachi period (1338–1573) Jesuit missionaries introduced the fables of Aesop to Japan, and the influence of these can be traced in stories written between then and the 19th century. (T.Io.)

Ballad

The ballad is a short narrative folk song whose distinctive style crystallized in Europe in the late Middle Ages and persists to the present day in communities where literacy, urban contacts, and mass media have not yet affected the habit of folk singing. France, Denmark, Germany, Russia, Greece, and Spain, as well as England and Scotland, possess impressive ballad collections. At least one-third of the 300 extant English and Scottish ballads have counterparts in one or several of these continental balladries, particularly those of Scandinavia. In no two language areas, however, are the formal characteristics of the ballad identical. For example, British and American ballads are invariably rhymed and strophic (*i.e.,* divided into stanzas); the Russian ballads known as *byliny* and almost all Balkan ballads are unrhymed and unstrophic; and, though the *romances* of Spain, as their ballads are called, and the Danish *viser* are alike in using assonance instead of rhyme, the Spanish ballads are generally unstrophic while the Danish are strophic, parcelled into either quatrains or couplets.

ELEMENTS

Narrative basis. Typically, the folk ballad tells a compact little story that begins cruptively at the moment when the narrative has turned decisively toward its catastrophe or resolution. Focussing on a single, climactic situation, the ballad leaves the inception of the conflict and the setting to be inferred or sketches them in hurriedly. Characterization is minimal, the characters revealing themselves in their actions or speeches; overt moral comment on the characters' behaviour is suppressed and their motivation seldom explicitly detailed. Whatever description occurs in ballads is brief and conventional; transitions between scenes are abrupt and time shifts are only vaguely indicated; crucial events and emotions are conveyed in crisp, poignant dialogue. In short, the ballad method of narration is directed toward achieving a bold, sensational, dramatic effect with purposeful starkness and abruptness. But despite the rigid economy of ballad narratives, a repertory of rhetorical devices is employed for prolonging highly charged moments in the story and thus thickening the emotional atmosphere. In the most famous of such devices, incremental repetition, a phrase or stanza is repeated several times with a slight but significant substitution at the same critical point. Suspense accumulates with each substitution, until at last the final and revelatory substitution bursts the pattern, achieving a climax and with it a release of powerful tensions. The following stanza is a typical example:

Rhetorical devices

Then out and came the thick, thick, blood,
  Then out and came the thin,
Then out and came the bonny heart's blood,
  Where all the life lay in.

Oral transmission. Since ballads thrive among unlettered people and are freshly created from memory at each separate performance, they are subject to constant variation in both text and tune. Where tradition is healthy and not highly influenced by literary or other outside cultural influences, these variations keep the ballad alive by gradually bringing it into line with the style of life, beliefs, and emotional needs of the immediate folk audience. Ballad tradition, however, like all folk arts, is basically conservative, a trait that explains the references in several ballads to obsolete implements and customs, as well as the appearance of words and phrases that are so badly garbled as to indicate that the singer does not understand their meaning though he takes pleasure in their sound and respects their traditional right to a place in his version of the song. The new versions of ballads that arise as the result of cumulative variations are no less authentic than their antecedents. A poem is fixed in its final form when published, but the printed or taped record of a ballad is representative only of its appearance in one place, in one line of tradition, and at one moment in its protean history. The first record of a ballad is not its original form but merely its earliest recorded form, and the recording of a ballad does not inhibit tradition from varying it subsequently into other shapes, because tradition preserves by re-creating rather than by exact reproduction.

COMPOSITION

Theories. How ballads are composed and set afloat in tradition has been the subject of bitter quarrels among scholars. The so-called communal school, which was led by two American scholars F.B. Gummere (1855–1919) and G.L. Kittredge (1860–1941), argued at first that ballads were composed collectively during the excitement of dance and song festivals. Under attack the communalists retreated to the position that although none of the extant ballads had been communally composed, the prototypical ballads that determined the style of the ballads had originated in this communal fashion. Their opponents were the individualists, who included the British men of letters W.J. Courthope (1842–1917) and Andrew Lang (1844–1912) and the American linguist Louise Pound (1872–1958). They held that each ballad was the work of an individual composer, who was not necessarily a folk singer, tradition serving simply as the vehicle for the oral perpetuation of the creation. According to the widely accepted communal re-creation theory, put forward by the American collector Phillips Barry (1880–1937) and the scholar G.H. Gerould (1877–1953), the ballad is conceded to be an individual composition originally. This fact is considered of little importance because the singer is not expressing himself individually, but serving as the deputy of the public voice, and because a ballad does not become a ballad until it has been accepted by the folk community and been remolded by the inevitable variations of tradition into a communal product. Ballads have also been thought to derive from art songs, intended for sophisticated audiences, which happened to filter down to a folk level and become folk song. This view, though plausible in the case of certain folk lyrics, is inapplicable to the ballads, for if the ballads were simply miscellaneous castoffs, it would not be possible to discern so clearly in them a style that is unlike anything in sophisticated verse.

Technique and form. Ballads are normally composed in two kinds of stanzas; the first consists of a couplet of lines each with four stressed syllables, and with an interwoven refrain:

But it would have made your heart right sair,
With a hey ho and a lillie gay
To see the bridegroom rive his haire,
As the primrose spreads so sweetly

the second a stanza of alternating lines of four stresses and three stresses, the second and fourth lines rhyming:

There lived a wife at Usher's Well,
And a wealthy wife was she;
She had three stout and stalwart sons.
And sent them o'er the sea.

Reference to the tunes show that the three-stress lines actually end in an implied fourth stress to match the pause in the musical phrase at these points. The interwoven refrain is a concession to the musical dimension of the ballad; it may be a set of nonsense syllables (Dillum down dillum, Fa la la la) or irrelevant rigmaroles of flowers or herbs. A few ballads have stanza-length burdens interspersed between the narrative stanzas, a technique borrowed from the medieval carols. The lyrical and incantatory effect of refrains during the ballad performance is very appealing, but in cold print they often look ridiculous, which is perhaps why early collectors failed to note them. In the first example above, it will be noted that the gaiety of the refrain is at odds with the mood of the meaningful lines. Not infrequently the ballad stanza satisfies the music's insistence on lyrical flourishes by repeating textual phrases and lines:

So he ordered the grave to be opened wide,
And the shroud to be turned down;
And there he kissed her clay cold lips
Till the tears came trickling down, down, down,
Till the tears came trickling down

Kinds of repetition used in ballads

The refrain is just one of the many kinds of repetition employed in ballads. Incremental repetition, already discussed, is the structural principle on which whole ballads ("The Maid Freed from the Gallows," "Lord Randal") are organized, and many other ballads contain long exchanges of similarly patterned phrases building cumulatively toward the denouement:

"Oh what will you leave to your father dear?"
"The silver-shod steed that brought me here."
"What will you leave to your mother dear?"
"My velvet pall and my silken gear."
"What will you leave to your brother John?"
"The gallows-tree to hang him on."

Any compressed narrative of sensational happenings told at a high pitch of feeling is bound to repeat words and phrases in order to accommodate the emotion that cannot be exhausted in one saying, a tendency that accounts for such stanzas as:

Then He says to His mother, "Oh: the withy [willow], oh:
the withy,
The bitter withy that causes me to smart, to
smart,
Oh: the withy, it shall be the very first tree
That perishes at the heart."

Much repetition in ballads is mnemonic as well as dramatic. Since ballads are performed orally, the hearer cannot turn back a page to recover a vital detail that slipped by in a moment of inattention. Crucial facts in narrative, therefore, are incised in the memory by skillful repetition; instructions given in a speech are exactly repeated when the singer reports the complying action; answers follow the form of the questions that elicited them.

Conventional imagery

The exigencies of oral performance also account for the conventional stereotyped imagery of the ballads. For unlike the poet, who reaches for the individualistic, arresting figure of speech, the ballad singer seldom ventures beyond a limited stock of images and descriptive adjectives. Knights are always gallant, swords royal, water wan, and ladies gay. Whatever is red is as red as blood, roses, coral, rubies, or cherries; white is stereotyped as snow white, lily white, or milk white. Such conventions fall into place almost by reflex action, easing the strain on the singer's memory and allowing him to give his full attention to the manipulation of the story. The resulting bareness of verbal texture, however, is more than compensated for by the dramatic rhetoric through which the narrative is projected. In any case, complex syntax and richness of language are forbidden to texts meant to be sung, for music engages too much of the hearer's attention for him to untangle an ambitious construction or relish an original image. Originality indeed, like anything else that exalts the singer, violates ballad decorum, which insists that the singer remain impersonal.

Music. A ballad is not technically a ballad unless it is sung; but though tunes and texts are dynamically interdependent, it is not unusual to find the same version of a ballad being sung to a variety of tunes of suitable rhythm and metre or to find the same tune being used for several different ballads. And just as there are clusters of versions for most ballads, so a given ballad may have associated with it a family of tunes whose members appear to be versions of a single prototypical form.

Ballad tunes are based on the modes rather than on the diatonic and chromatic scales that are used in modern music. Where chromaticism is detected in American folk music, the inflected tones are derived from black folk practice or from learned music. Of the six modes, the preponderance of folk tunes are Ionian, Dorian, or Mixolydian; Lydian and Phrygian tunes are rare. The folk music least affected by sophisticated conditioning does not avail itself of the full seven tones that compose each of the modal scales. Instead, it exhibits gapped scales, omitting either one of the tones (hexatonic) or two of them (pentatonic). Modulation sometimes occurs in a ballad from one mode to an adjacent mode.

Most tunes consist of 16 bars with duple rhythm, or two beats per measure, prevailing slightly over triple rhythm. The tune, commensurate with the ballad stanza, is repeated as many times as there are stanzas. Unlike the "through-composed" art song, where the music is given nuances to correspond to the varying emotional colour of the content, the folk song affords little opportunity to inflect the contours of the melody. This limitation partly explains the impassive style of folk singing. Musical variation, however, is hardly less frequent than textual variation; indeed, it is almost impossible for a singer to perform a ballad exactly the same way twice. The stablest part of the tune occurs at the mid-cadence (the end of the second text line) and the final cadence (the end of the fourth line). The third phrase of the tune, corresponding to the third line of the stanza, proves statistically the most variable. Significantly, these notes happen to coincide with the rhyming words. The last note of the tune, the point of resolution and final repose, usually falls on the fundamental tone (*i.e.*, keynote) of the scale; the mid-cadence falling normally a perfect fifth above the tonic or a perfect fourth below it. To make for singability, the intervals in the melodic progression seldom involve more than three degrees. And since the singer performs solo or plays the accompanying instrument himself, he need not keep rigidly to set duration or stress but may introduce grace notes to accommodate hypermetric syllables and lengthen notes for emphasis.

Impassive style of folk singing

TYPES OF BALLADRY

The traditional folk ballad, sometimes called the Child ballad in deference to Francis Child, the scholar who compiled the definitive English collection, is the standard kind of folk ballad in English and is the type of balladry that this section is mainly concerned with. But there are peripheral kinds of ballads that must also be noticed in order to give a survey of balladry.

Minstrel ballad. Minstrels, the professional entertainers of nobles, squires, rich burghers, and clerics until the 17th century, should properly have had nothing to do with folk ballads, the self-created entertainment of the peasantry. Minstrels sometimes, however, affected the manner of folk song or remodelled established folk ballads. Child included many minstrel ballads in his collection on the ground that fragments of traditional balladry were embedded in them. The blatant style of minstrelsy marks these ballads off sharply from folk creations. In violation of the strict impersonality of the folk ballads, minstrels constantly intrude into their narratives with moralizing comments and fervent assurances that they are not lying at the very moment when they are most fabulous. The

Difference between minstrel and folk ballads

ministrels manipulate the story with coarse explicitness, begging for attention in a servile way, predicting future events in the story and promising that it will be interesting and instructive, shifting scenes obtrusively, reflecting on the characters' motives with partisan prejudice. Often their elaborate performances are parcelled out in clear-cut divisions, usually called fits or cantos, in order to forestall tedium and build up suspense by delays and piecemeal revelations. Several of the surviving minstrel pieces are poems in praise of such noble houses as the Armstrongs ("Johnie Armstrong"), the Stanleys ("The Rose of England"), and the Percys ("The Battle of Otterburn," "The Hunting of the Cheviot," "The Earl of Westmoreland"), doubtless the work of propagandists in the employ of these families. The older Robin Hood ballads are also minstrel propaganda, glorifying the virtues of the yeomanry, the small independent landowners of preindustrial England. The longer, more elaborate minstrel ballads were patently meant to be recited rather than sung.

Broadside ballad. Among the earliest products of the printing press were broadsheets about the size of handbills on which were printed the text of ballads. A crude woodcut often headed the sheet, and under the title it was specified that the ballad was to be sung to the tune of some popular air. Musical notation seldom appeared on the broadsides; those who sold the ballads in the streets and at country fairs sang their wares so that anyone unfamiliar with the tune could learn it by listening a few times to the balladmonger's rendition. From the 16th century until the end of the 19th century, broadsides, known also as street ballads, stall ballads, or slip songs, were a lively commodity, providing employment for a troop of hack poets. Before the advent of newspapers, the rhymed accounts of current events provided by the broadside ballads were the chief source of spectacular news. Every sensational public happening was immediately clapped into rhyme and sold on broadsheets. Few of the topical pieces long survived the events that gave them birth, but a good number of pathetic tragedies, such as "The Children in the Wood" and broadsides about Robin Hood, Guy of Warwick, and other national heroes, remained perennial favourites. Although the broadside ballad represents the adaptation of the folk ballad to the urban scene and middle class sensibilities, the general style more closely resembles minstrelsy, only with a generous admixture of vulgarized traits borrowed from book poetry. A few folk ballads appeared on broadsheets; many ballads, however, were originally broadside ballads the folk adapted.

Broadside ballad as a source of news

Literary ballads. The earliest literary imitations of ballads were modelled on broadsides, rather than on folk ballads. In the early part of the 18th century, Jonathan Swift, who had written political broadsides in earnest, adapted the style for several jocular bagatelles. Poets such as Swift, Matthew Prior, and William Cowper in the 18th century and Thomas Hood, W.M. Thackeray, and Lewis Carroll in the 19th century made effective use of the jingling metres, forced rhymes, and unbuttoned style for humorous purposes. Lady Wardlaw's "Hardyknute" (1719), perhaps the earliest literary attempt at a folk ballad, was dishonestly passed off as a genuine product of tradition. After the publication of Thomas Percy's ballad compilation *Reliques of Ancient English Poetry* in 1765, ballad imitation enjoyed a considerable vogue, which properly belongs in the history of poetry rather than balladry.

SUBJECT MATTER

The supernatural. The finest of the ballads are deeply saturated in a mystical atmosphere imparted by the presence of magical appearances and apparatus. "The Wife of Usher's Well" laments the death of her children so unconsolably that they return to her from the dead as revenants; "Willie's Lady" cannot be delivered of her child because of her wicked mother-in-law's spells, an enchantment broken by a beneficent household spirit; "The Great Silkie of Sule Skerry" begets upon an "earthly" woman a son, who, on attaining maturity, joins his seal father in the sea, there shortly to be killed by his mother's human husband; "Kemp Owyne" disenchants a bespelled maiden by kissing her despite her bad breath and savage looks. An encounter between a demon and a maiden occurs in "Lady Isabel and the Elf-Knight," the English counterpart of the ballads known to the Dutch-Flemish as "Herr Halewijn," to Germans as "Ulinger," to Scandinavians as "Kvindemorderen" and to the French as "Renaud le Tueur de Femme." In "The House Carpenter," a former lover (a demon in disguise) persuades a wife to forsake husband and children and come away with him, a fatal decision as it turns out. In American and in late British tradition the supernatural tends to get worked out of the ballads by being rationalized: instead of the ghost of his jilted sweetheart appearing to Sweet William of "Fair Margaret and Sweet William" as he lies in bed with his bride, it is rather the dead girl's image in a dream that kindles his fatal remorse. In addition to those ballads that turn on a supernatural occurrence, casual supernatural elements are found all through balladry.

Romantic tragedies. The separation of lovers through a misunderstanding or the opposition of relatives is perhaps the commonest ballad story. "Barbara Allen" is typical: Barbara cruelly spurns her lover because of an unintentional slight; he dies of lovesickness, she of remorse. The Freudian paradigm operates rigidly in ballads: fathers oppose the suitors of their daughters, mothers the sweethearts of their sons. Thus "The Douglas Tragedy"—the Danish "Ribold and Guldborg"—occurs when an eloping couple is overtaken by the girl's father and brothers or "Lady Maisry," pregnant by an English lord, is burned by her fanatically Scottish brother. Incest, frequent in ballads recorded before 1800 ("Lizie Wan," "The Bonny Hind"), is shunned by modern tradition.

The Freudian paradigm

Romantic comedies. The outcome of a ballad love affair is not always, though usually, tragic. But even when true love is eventually rewarded, such ballad heroines as "The Maid Freed from the Gallows" and "Fair Annie," among others, win through to happiness after such bitter trials that the price they pay seems too great. The course of romance runs hardly more smoothly in the many ballads, influenced by the cheap optimism of broadsides, where separated lovers meet without recognizing each other: the girl is told by the "stranger" of her lover's defection or death: her ensuing grief convinces him of her sincere love: he proves his identity and takes the joyful girl to wife. "The Bailiff's Daughter of Islington" is a classic of the type. Later tradition occasionally foists happy endings upon romantic tragedies: in the American "Douglas Tragedy" the lover is not slain but instead gets the irate father at his mercy and extorts a dowry from him. With marriage a consummation so eagerly sought in ballads, it is ironical that the bulk of humorous ballads deal with shrewish wives ("The Wife Wrapped in Wether's Skin") or gullible cuckolds ("Our Goodman").

Crime. Crime, and its punishment, is the theme of innumerable ballads: his sweetheart poisons "Lord Randal"; "Little Musgrave" is killed by Lord Barnard when he is discovered in bed with Lady Barnard, and the lady, too, is gorily dispatched. The murders of "Jim Fisk," Johnny of "Frankie and Johnny," and many other ballad victims are prompted by sexual jealousy. One particular variety of crime ballad, the "last goodnight," represents itself falsely to be the contrite speech of a criminal as he mounts the scaffold to be executed. A version of "Mary Hamilton" takes this form, which was a broadside device widely adopted by the folk. "Tom Dooley" and "Charles Guiteau," the scaffold confession of the assassin of Pres. James A. Garfield, are the best known American examples.

Medieval romance. Perhaps a dozen or so ballads derive from medieval romances. As in "Hind Horn" and "Thomas Rymer," only the climactic scene is excerpted for the ballad. In general, ballads from romances have not worn well in tradition because of their unpalatable fabulous elements, which the modern folk apparently regard as childish. Thus "Sir Lionel" becomes in America "Bangum and the Boar," a humorous piece to amuse children. Heterodox apocryphal legends that circulated widely in the Middle Ages are the source of almost all religious ballads, notable "Judas," "The Cherry-Tree Carol," and "The Bitter Withy." The distortion of biblical narrative is not peculiarly British: among others, the Russian bal-

lads of Samson and Solomon, the Spanish "Pilgrim to Compostela" and the French and Catalonian ballads on the penance of Mary Magdalence reshape canonical stories radically.

Historical ballads. Historical ballads date mainly from the period 1550–750, though a few, like "The Battle of Otterburn," celebrate events of an earlier date, in this case 1388. "The Hunting of the Cheviot," recorded about the same time and dealing with the same campaign, is better known in a late broadside version called "Chevy Chase." The details in historical ballads are usually incorrect as to fact because of faulty memory or partisan alterations, but they are valuable in reflecting folk attitudes toward the events they imperfectly report. For example, neither "The Death of Queen Jane," about one of the wives of Henry VIII, nor "The Bonny Earl of Murray" is correct in key details, but they accurately express the popular mourning for these figures. By far the largest number of ballads that can be traced to historical occurrences have to do with local skirmishes and matters of regional rather than national importance. The troubled border between England and Scotland in the 16th and early 17th century furnished opportunities for intrepid displays of loyalty, courage, and cruelty that are chronicled in such dramatic ballads as "Edom o Gordon," "The Fire of Frendraught," "Johnny Cock," "Johnie Armstrong," and "Hobie Noble." Closely analogous to these are Spanish *romances* such as "The Seven Princes of Lara," on wars between Moors and Christians.

Disaster. Sensational shipwrecks, plagues, train wrecks, mine explosions—all kinds of shocking acts of God and man—were regularly chronicled in ballads, a few of which remained in tradition, probably because of some special charm in the language or the music. The shipwreck that lies in the background of one of the most poetic of all ballads "Sir Patrick Spens" cannot be fixed, but "The Titanic," "Casey Jones," "The Wreck on the C & O," and "The Johnstown Flood" are all circumstantially based on actual events.

Epic and saga heroes

Outlaws and badmen. Epic and saga heroes figure prominently in Continental balladries, notable examples being the Russian Vladimir, the Spanish Cid Campeador, the Greek Digenes Akritas, and the Danish Tord of Havsgaard and Diderik. This kind of hero never appears in English and Scottish ballads. But the outlaw hero of the type of the Serbian Makro Kraljević or the Danish Marsk Stig is exactly matched by the English Robin Hood, who is the hero of some 40 ballads, most of them of minstrel or broadside provenance. His chivalrous style and generosity to the poor was imitated by later ballad highwaymen in "Dick Turpin," "Brennan on the Moor," and "Jesse James." "Henry Martyn" and "Captain Kidd" were popular pirate ballads, but the most widely sung was "The Flying Cloud," a contrite "goodnight" warning young men to avoid the curse of piracy. The fact that so many folk heroes are sadistic bullies ("Stagolee"), robbers ("Dupree"), or pathological killers ("Sam Bass," "Billy the Kid") comments on the folk's hostile attitude toward the church, constabulary, banks, and railroads. The kindly, law-abiding, devout, enduring steel driver "John Henry" is a rarity among ballad heroes.

Occupational ballads. A large section of balladry, especially American, deals with the hazards of such occupations as seafaring ("The Greenland Whale Fishery"), lumbering ("The Jam on Gerry's Rock"), mining ("The Avondale Mine Disaster"), herding cattle ("Little Joe the Wrangler"), and the hardships of frontier life ("The Arkansaw Traveler"). But men in these occupations sang ballads also that had nothing to do with their proper work: "The Streets of Laredo," for example, is known in lumberjack and soldier versions as well as the usual cowboy lament version, and the pirate ballad "The Flying Cloud" was much more popular in lumbermen's shanties than in forecastles.

CHRONOLOGY

Singing stories in song, either stories composed for the occasion out of a repertory of traditional motifs or phrases or stories preserved by memory and handed down orally, is found in most primitive cultures. The ballad habit thus is unquestionably very ancient. But the ballad genre itself could not have existed in anything like its present form before about 1100. "Judas," the oldest example found in Francis James Child's exhaustive collection, *The English and Scottish Popular Ballads* (1882–98), dates from 1300, but until the 17th century ballad records are sparse indeed. As an oral art, the ballad does not need to be written down to be performed or preserved; in any case, many of the carriers of the ballad tradition are illiterate and could not make use of a written and notated ballad. The few early ballads' records survived accidentally, due to some monk's, minstrel's, or antiquary's fascination with rustic pastimes.

Precise dating almost impossible

The precise date of a ballad, therefore, or even any particular version of a ballad, is almost impossible to determine. In fact, to ask for the date of a folk ballad is to show that one misunderstands the peculiar nature of balladry. As remarked earlier, the first recording of a ballad must not be assumed to be the ballad's original form; behind each recorded ballad can be one detected the working of tradition upon some earlier form, since a ballad does not become a ballad until it has run a course in tradition. Historical ballads would seem on the surface to be easily datable, but their origins are usually quite uncertain. The ballad could have arisen long after the events it describes, basing itself, as do the Russian ballads of the Kievan cycle and the Spanish ballads about the Cid, on chronicles or popular legends. It is also likely that many historical ballads developed from the revamping of earlier ballads on similar themes through the alteration of names, places, and local details. (A.B.F.)

Romance

Medieval romance developed in western Europe from the 12th century onward, and was extended up to and after the Renaissance, and reemerged in the 18th century.

The Old French word *romanz* originally meant "the speech of the people," or "the vulgar tongue," from a popular Latin word, *Romanice*, meaning written in the vernacular, in contrast with the written form of literary Latin. Its meaning then shifted from the language in which the work was written to the work itself. Thus, an adaptation of Geoffrey of Monmouth's *Historia regum Britanniae* (*c.* 1137), made by Wace of Jersey in 1155, was known as *Li Romanz de Brut*, while an anonymous adaptation (of slightly later date) of Virgil's *Aeneid* was known as *Li Romanz d'Enéas*; it is difficult to tell whether in such cases *li romanz* still meant "the French version" or had already come to mean "the story." It soon specialized in the latter sense, however, and was applied to narrative compositions similar in character to those imitated from Latin sources but totally different in origin; and, as the nature of these compositions changed, the word itself acquired an increasingly wide spectrum of meanings. In modern French a *roman* is just a novel, whatever its content and structure; while in modern English the word "romance" (derived from Old French *romanz*) can mean either a medieval narrative composition or a love affair, or, again, a story about a love affair, generally one of a rather idyllic or idealized type, sometimes marked by strange or unexpected incidents and developments; and "to romance" has come to mean "to make up a story that has no connection with reality."

For a proper understanding of these changes it is essential to know something of the history of the literary form to which, since the Middle Ages, the term has been applied. The account that follows is intended to elucidate historically some of the ways in which the word is used in English and in other European languages.

THE COMPONENT ELEMENTS

Greek romances

The romances of love, chivalry, and adventure produced in 12th-century France have analogues elsewhere, notably in what are sometimes known as the Greek romances—narrative works in prose by Greek writers from the 1st century BC to the 3rd century AD. The first known, the fragmentary Ninus romance, in telling the story of the love of Ninus, mythical founder of Nineveh, anticipates the

medieval *roman d'antiquité.* A number of works by writers of the 2nd and 3rd centuries AD—Chariton, Xenophon of Ephesus, Heliodorus, Achilles Tatius, and Longus—introduce a theme that was to reappear in the *roman d'aventure:* that of faithful lovers parted by accident or design and reunited only after numerous adventures. Direct connection, however, can be proved only in the case of the tale of *Apollonius of Tyre,* presumably deriving from a lost Greek original but known through a 3rd- or 4th-century Latin version. This too is a story of separation, adventure, and reunion, and, like the others (except for Longus' pastoral *Daphnis and Chloë*), it has a quasi-historical setting. It became one of the most popular and widespread stories in European literature during the Middle Ages and later provided Shakespeare with the theme of *Pericles.*

Style and subject matter. But the real debt of 12th-century romance to classical antiquity was incurred in a sphere outside that of subject matter. During the present century, scholars have laid ever-increasing emphasis on the impact of late classical antiquity upon the culture of medieval Europe, especially on that of medieval France. In particular, it is necessary to note the place that rhetoric (the systematic study of oratory) had assumed in the educational system of the late Roman Empire. Originally conceived as part of the training for public speaking, essential for the lawyer and politician, it had by this time become a literary exercise, the art of adorning or expanding a set theme: combined with grammar and enshrined in the educational system inherited by the Christian Church, rhetoric became an important factor in the birth of romance. Twelfth-century romance was, at the outset, the creation of "clerks"—professional writers who had been trained in grammar (that is to say, the study of the Latin language and the interpretation of Latin authors) and in rhetoric in the cathedral schools. They were skilled in the art of exposition, by which a subject matter was not only developed systematically but also given such meaning as the author thought appropriate. The "romance style" was, apparently, first used by the authors of three *romans d'antiquité,* all composed in the period 1150–65: *Roman de Thebes,* an adaptation of the epic *Thebaïs* by the late Latin poet Statius; *Roman d'Enéas,* adapted from Virgil's *Aeneid;* and *Roman de Troie,* a retelling by Benoît de Sainte-Maure of the tale of Troy, based not on Homer (who was not known in western Europe, where Greek was not normally read) but on 4th- and 5th-century Latin versions. In all three, style and subject matter are closely interconnected; elaborate set descriptions, in which the various features of what is described are gone through, item by item, and eulogized, result in the action's taking place in lavish surroundings, resplendent with gold, silver, marble, fine textiles, and precious stones. To these embellishments are added astonishing works of architecture and quaint technological marvels, that recall the Seven Wonders of the World and the reputed glories of Byzantium. *Troie* and *Enéas* have, moreover, a strong love interest, inspired by the Roman poet Ovid's conception of love as a restless malady. This concept produced the first portrayal in Western literature of the doubts, hesitations, and self-torment of young lovers, as exemplified in the Achilles–Polyxena story in *Troie* and in the Aeneas–Lavinia story in *Enéas.* Yet even more important is the way in which this new theme is introduced: the rhetorical devices appropriate to expounding an argument are here employed to allow a character in love to explore his own feelings, to describe his attitude to the loved one, and to explain whatever action he is about to take.

Earliest works in the "romance style"

Developing psychological awareness. As W.P. Ker, a pioneer in the study of medieval epic and romance, observed in his *Epic and Romance* (1897), the advent of romance is "something as momentous and as far-reaching as that to which the name Renaissance is generally applied." The Old French poets who composed the chansons de geste (as the Old French epics are called) had been content to tell a story; they were concerned with statement, not with motivation, and their characters could act without explicitly justifying their actions. Thus, in what is one of the earliest and certainly the finest of the chansons de geste, the *Chanson de Roland* (*c.* 1100), the hero's decision to fight on against odds—to let the rear guard of Charlemagne's army be destroyed by the Saracen hordes in the hopeless and heroic Battle of Roncesvalles rather than sound his horn to call back Charlemagne—is not treated as a matter for discussion and analysis: the anonymous poet seems to take it for granted that the reader is not primarily concerned with the reason why things happened as they did. The new techniques of elucidating and elaborating material, developed by romance writers in the 12th century, produced a method whereby actions, motives, states of mind, were scrutinized and debated. The story of how Troilus fell in love with Briseïs and how, when taken to the Grecian camp, she deserted him for Diomedes (as related, and presumably invented, by Benoît de Sainte-Maure in his *Roman de Troie*) is not one of marvellous adventures in some exotic fairyland setting: it is clearly a theme of considerable psychological interest, and it was for this reason that it attracted three of the greatest writers of all time: Boccaccio in his *Filostrato* (*c.* 1338), Chaucer in his *Troilus and Criseyde* (before 1385), and Shakespeare in his *Troilus and Cressida* (*c.* 1601–02). With the 12th-century pioneers of what came to be called romance, the beginnings of the analytical method found in the modern novel can easily be recognized.

The development of more sophisticated techniques

Sources and parallels. Where exactly medieval romance writers found their material when they were not simply copying classical or pseudo-classical models is still a highly controversial issue. Parallels to certain famous stories, such as that of Tristan and Iseult, have been found in regions as wide apart as Persia and Ireland: in the mid-11th-century Persian epic of *Wīs and Ramin* and in the Old Irish *Diarmaid and Gráinne;* but while in the latter case it is possible to argue in favour of a genetic link between the two traditions, the former is more likely to be a case of parallel development due, on the one hand, to the inner logic of the theme and, on the other, to certain similarities in the ideological and social background of the two works. Failure to maintain the essential distinction between source and parallel has greatly hindered the understanding of the true nature of medieval romance and has led to the production of a vast critical literature the relevance of which to the study of the genre is at best questionable.

The marvellous. The marvellous is by no means an essential ingredient of "romance" in the sense in which it has been defined. Yet to most English readers the term romance does carry implications of the wonderful, the miraculous, the exaggerated, and the wholly ideal. Ker regarded much of the literature of the Middle Ages as "romantic" in this sense—the only types of narrative free from such "romanticizing" tendencies being the historical and family narrative, or Icelanders' sagas developed in classical Icelandic literature at the end of the 12th and in the early 13th century. The *Chanson de Roland* indulges freely in the fantastic and the unreal: hence Charlemagne's patriarchal age and preternatural strength (he is more than 200 years old when he conquers Spain); or the colossal numbers of those slain by the French; or, again, the monstrous races of men following the Saracen banners. Pious legends, saints' lives, and stories of such apocryphal adventures as those of the Irish St. Brendan (*c.* 486–578) who, as hero of a legend first written down in the 9th-century, *Navigatio Brendani,* and later widely translated and adapted, wanders among strange islands on his way to the earthly paradise—these likewise favour the marvellous. The great 12th-century *Roman d'Alexandre,* a *roman d'antiquité* based on and developing the early Greek romance of Alexander the Great (the Alexander romance), was begun in the first years of the century by Alberic de Briançon and later continued by other poets. It introduces fantastic elements, more especially technological wonders and the marvels of India: the springs of rejuvenation, the flower-maidens growing in a forest, the cynocephali (dog-headed men), the bathyscaphe that takes Alexander to the bottom of the ocean, and the car in which he is drawn through the air by griffins on his celestial journey.

The setting. The fact that so many medieval romances are set in distant times and remote places is not an essential feature of romance but rather a reflection of its

origins. As has been seen, the Old French word *romanz* early came to mean "historical work in the vernacular." All the *romans d'antiquité* have a historical or pseudo-historical theme, whether they evoke Greece, Troy or the legendary world of Alexander; but, while making some attempt to give antiquity an exotic aspect by means of marvels or technological wonders, medieval writers were quite unable to create a convincing historical setting; and thus in all important matters of social life and organization they projected the western European world of the 12th century back into the past. Similarly, historical and contemporary geography were not kept separate. The result is often a confused jumble, as, for example, in the Anglo-Norman Hue de Rotelande's *Protesilaus*, in which the characters have Greek names: the action takes place in Burgundy, Crete, Calabria, and Apulia; and Theseus is described as "king of Denmark." This lavish use of exotic personal and geographical names and a certain irresponsibility about settings was still to be found in some of Shakespeare's romantic comedies: the "seacoast of Bohemia" in *The Winter's Tale* is thoroughly medieval in its antecedents. In the medieval period, myth and folktale and straightforward fact were on an equal footing. Not that any marvel or preternatural happening taking place in secular (as opposed to biblical) history was necessarily to be believed: it was simply that the remote times and regions were convenient locations for picturesque and marvellous incidents. It is, indeed, at precisely this point that the transition begins from the concept of romance as "past history in the vernacular" to that of "a wholly fictitious story."

Errors of history and geography in early romance

MEDIEVAL VERSE ROMANCES

Arthurian romance. *The matter of Britain.* In his *Historia regum Britanniae*, Geoffrey of Monmouth "invented history" by drawing on classical authors, the Bible, and Celtic tradition to create the story of a British kingdom, to some extent paralleling that of Israel. He described the rise of the British people to glory in the reigns of Uther Pendragon and Arthur, then the decline and final destruction of the kingdom, with the exile of the British survivors and their last king, Cadwalader. Romances that have Arthur or some of his knights as main characters were classified as *matière de Bretagne* by Jehan Bodel (fl. 1200) in a well-known poem. There is in this "matter of Britain" a certain amount of material ultimately based on the belief—probably Celtic in origin—in an otherworld into which men can penetrate, where they can challenge those who inhabit it or enjoy the love of fairy women. Such themes appear in a highly rationalized form in the lays (*lais*) of the late 12th-century Marie de France, although she mentions Arthur and his queen only in one, the lay of *Lanval*.

Chrétien de Troyes. It was Chrétien de Troyes (fl. 1165–80) who in five romances (*Erec; Cligès; Lancelot, ou Le Chevalier de la charrette; Yvain, ou Le Chevalier au lion;* and *Perceval, ou Le Conte du Graal*) fashioned a new type of narrative based on the matter of Britain. The internal debate and self-analysis of the *roman d'antiquité* is here used with artistry. At times, what seems to matter most to the poet is not the plot but the thematic pattern he imposes upon it and the significance he succeeds in conveying, either in individual scenes in which the action is interpreted by the characters in long monologues or through the work as a whole. In addition to this, he attempts what he himself calls a *conjointure*—that is, the organization into a coherent whole of a series of episodes. The adventures begin and end at the court of King Arthur; but the marvels that bring together material from a number of sources are not always meant to be believed, especially as they are somehow dovetailed into the normal incidents of life at a feudal court. Whatever Chrétien's intentions may have been, he inaugurated what may be called a Latin tradition of romance—clear, hard, bright, adorned with rhetoric, in which neither the courtly sentiment nor the enchantments are seriously meant. Chrétien had only one faithful follower, the trouvère Raoul de Houdenc (fl. 1200–30), author of *Méraugis de Portlesguez*. He shared Chrétien's taste for love casuistry, rhetorical adornment, and fantastic adventure. For both of these authors, elements of rhetoric and self-analysis remain important, although the dose of rhetoric varies from one romance to another. Even in Chrétien's *Perceval, ou Le Conte du Graal* ("Perceval, or the Romance of the Grail")—the work in which the Grail appears for the first time in European literature—the stress is on narrative incident interspersed with predictions of future happenings and retrospective explanations. Arthurian romances of the period 1170–1250 are *romans d'aventure*, exploiting the strange, the supernatural, and the magical in the Arthurian tradition. A number (for example, *La Mule sans frein* ["The Mule Without a Bridle"], *c.* 1200, and *L'Âtre périlleux* ["The Perilous Churchyard"], *c.* 1250) have as their hero Arthur's nephew Gawain, who in the earlier Arthurian verse romances is a type of the ideal knight.

Introduction of the Grail theme into European literature

Love as a major theme. The treatment of love varies greatly from one romance to another. It is helpful to distinguish sharply here between two kinds of theme: the one, whether borrowed from classical antiquity (such as the story of Hero and Leander or that of Pyramus and Thisbe, taken from Ovid's *Metamorphoses*) or of much more recent origin, ending tragically; the other ending with marriage, reconciliation, or the reunion of separated lovers. It is noteworthy that "romance," as applied to a love affair in real life, has in modern English the connotation of a happy ending. This is also true of most Old French love romances in verse: the tragic ending is rare and is usually linked with the theme of the lover who, finding his or her partner dead, joins the beloved in death, either by suicide or from grief.

The Tristan story. The greatest tragic love story found as a romance theme is that of Tristan and Iseult. It was given the form in which it has become known to succeeding generations in about 1150–60 by an otherwise unknown Old French poet whose work, although lost, can be reconstructed in its essentials from surviving early versions based upon it. Probably closest in spirit to the original is the fragmentary version of *c.* 1170–90 by the Norman poet Béroul. From this it can be inferred that the archetypal poem told the story of an all-absorbing passion caused by a magic potion, a passion stronger than death yet unable to triumph over the feudal order to which the heroes belong. The story ended with Iseult's death in the embrace of her dying lover and with the symbol of two trees growing from the graves of the lovers and intertwining their branches so closely that they could never be separated. Most later versions, including a courtly version by an Anglo-Norman poet known only as Thomas, attempt to resolve the tragic conflict in favour of the sovereignty of passion and to turn the magic potion into a mere symbol. Gottfried von Strassburg's German version, *Tristan und Isolde* (*c.* 1210), based on Thomas, is one of the great courtly romances of the Middle Ages; but, although love is set up as the supreme value and as the object of the lovers' worship, the mellifluous and limpid verse translates the story into the idyllic mode. Another tragic and somewhat unreal story is that told in the anonymous *Chastelaine de Vergi* (*c.* 1250), one of the gems of medieval poetry, in which the heroine dies of grief because, under pressure, her lover has revealed their secret and adulterous love to the duke of Burgundy. The latter tells it to his own wife, who allows the heroine to think that her lover has betrayed her. The theme of the dead lover's heart served up by the jealous husband to the lady—tragic, sophisticated, and far-fetched—appears in the anonymous *Chastelain de Couci* (*c.* 1280) and again in *Daz Herzmaere* by the late 13th-century German poet Konrad von Würzburg. The theme of the outwitting of the jealous husband, common in the fabliaux (short verse tales containing realistic, even coarse detail and written to amuse), is frequently found in 13th-century romance and in lighter lyric verse. It occurs both in the *Chastelain de Couci* and in the Provençal romance *Flamenca* (*c.* 1234), in which it is treated comically.

Later versions of the Tristan and Iseult theme

The theme of separation and reunion. But the theme that has left the deepest impress on romance is that of a happy resolution, after many trials and manifold dangers, of lovers' difficulties. As has been seen, this theme was derived from late classical Greek romance by way of *Apollonius of Tyre* and its numerous translations and variants.

A somewhat similar theme, used for pious edification, is that of the legendary St. Eustace, reputedly a high officer under the Roman emperor Trajan, who lost his position, property, and family only to regain them after many tribulations, trials, and dangers. The St. Eustace theme appears in *Guillaume d'Angleterre*, a pious tale rather than a romance proper, which some have attributed to Chrétien de Troyes.

The Floire and Blancheflor romance

A variant on the theme of separation and reunion is found in the romance of *Floire et Blancheflor* (*c.* 1170), in which Floire, son of the Saracen "king" of Spain, is parted by his parents from Blancheflor, daughter of a Christian slave of noble birth, who is sold to foreign slave dealers. He traces her to a tower where maidens destined for the sultan's harem are kept, and the two are reunited when he gains access to her there by hiding in a basket of flowers. This romance was translated into Middle High German, Middle Dutch, Norse, and Middle English (as *Floris and Blancheflur*, *c.* 1250) and in the early 13th century was imitated in *Aucassin et Nicolette*, which is a *chantefable* (a story told in alternating sections of sung verse and recited prose) thought by some critics to share a common source with *Floire et Blancheflor*. In it, the roles and nationality, or religion, of the main characters are reversed; Nicolette, a Saracen slave converted to Christianity, who proves to be daughter of the king of Carthage, disguises herself as a minstrel in order to return to Aucassin, son of Count Gavin of Beaucaire. Jean Renart's *L'Escoufle* (*c.* 1200–02) uses the theme of lovers who, accidentally separated while fleeing together from the emperor's court, are eventually reunited; and the highly esteemed and influential *Guillaume de Palerne* (*c.* 1200) combines the theme of escaping lovers with that of the "grateful animal" (here a werewolf, which later resumes human shape as a king's son) assisting the lovers in their successful flight. The popular *Partenopeus de Blois* (*c.* 1180), of which 10 French manuscripts and many translated versions are known, resembles the Cupid and Psyche story told in the Roman writer Apuleius' *Golden Ass* (2nd century AD), although there is probably no direct connection. In the early 13th-century *Galeran de Bretagne*, Galeran loves Fresne, a foundling brought up in a convent; the correspondence between the two is discovered, and Fresne is sent away but appears in Galeran's land just in time to prevent him from marrying her twin sister, Fleurie.

The theme of a knight who undertakes adventures to prove to his lady that he is worthy of her love is represented by a variety of romances including the *Ipomedon* (1174–90) of Hue de Rotelande and the anonymous mid-13th-century Anglo-Norman *Gui de Warewic*. Finally, there are many examples of the "persecuted heroine" theme; in one variety a person having knowledge of some "corporal sign"—a birthmark or mole—on a lady wagers with her husband that he will seduce her and offer proof that he has done so (this is sometimes called the "Imogen theme" from its use in Shakespeare's *Cymbeline*). The deceit is finally exposed and the lady's honour vindicated. In the early 13th-century *Guillaume de Dôle* by Jean Renart, the birthmark is a rose; and in the *Roman de Violette*, written after 1225 by Gerbert de Montreuil, it is a violet. Philippe de Beaumanoir's *La Manekine* (*c.* 1270), Jean Maillart's *La Contesse d'Anjou* (1361), and Chaucer's *Man of Law's Tale* (after 1387) all treat the theme of the tribulations of a wife falsely accused and banished but, after many adventures, reunited with her husband.

The "Imogen theme"

MEDIEVAL PROSE ROMANCES

Arthurian themes. The Arthurian prose romances arose out of the attempt, made first by Robert de Boron in the verse romances *Joseph d'Arimathie, ou le Roman de l'estoire dou Graal* and *Merlin* (*c.* 1190–1200), to combine the fictional history of the Holy Grail with the chronicle of the reign of King Arthur. Robert gave his story an allegorical meaning, related to the person and work of Christ. A severe condemnation of secular chivalry and courtly love characterize the Grail branch of the prose Lancelot-Grail, or Vulgate, cycle as well as some parts of the post-Vulgate "romance of the Grail" (after 1225); in the one case, Lancelot (here representing fallen human nature) and, in the other, Balain (who strikes the Dolorous Stroke) are contrasted with Galahad, a type of the Redeemer. The conflict between earthly chivalry and the demands of religion is absent from the *Perlesvaus* (after 1230?), in which the hero Perlesvaus (that is, Perceval) has Christological overtones and in which the task of knighthood is to uphold and advance Christianity. A 13th-century prose *Tristan* (*Tristan de Léonois*), fundamentally an adaptation of the Tristan story to an Arthurian setting, complicates the love theme of the original with the theme of a love rivalry between Tristan and the converted Saracen Palamède and represents the action as a conflict between the treacherous villain King Mark and the "good" knight Tristan.

The ideals of chivalry

In the 14th century, when chivalry enjoyed a new vogue as a social ideal and the great orders of secular chivalry were founded, the romance writers, to judge from what is known of the voluminous *Perceforest* (written *c.* 1330 and still unpublished in its entirety), evolved an acceptable compromise between the knight's duty to his king, to his lady, and to God. Chivalry as an exalted ideal of conduct finds its highest expression in the anonymous Middle English *Sir Gawayne and the Grene Knight* (*c.* 1370), whose fantastic beheading scene (presumably taken from a lost French prose romance source) is made to illustrate the fidelity to the pledged word, the trust in God, and the unshakable courage that should characterize the knight.

The special structure of the Lancelot-Grail romance

Structure. The Vulgate *Lancelot-Grail* cycle displays a peculiar technique of interweaving that enables the author (or authors) to bring together a large number of originally independent themes. The story of Lancelot, of Arthur's kingdom, and the coming of Galahad (Lancelot's son) are all interconnected by the device of episodes that diverge, subdivide, join, and separate again, so that the work is a kind of interlocking whole, devoid of unity in the modern sense but forming as impregnable a structure as any revolving around a single centre. One of its most important features is its capacity for absorbing contrasting themes, such as the story of Lancelot's love for Guinevere, Arthur's queen, and the Quest of the Grail; another feature is its ability to grow through continuations or elaborations of earlier themes insufficiently developed. The great proliferation of prose romances at the end of the Middle Ages would have been impossible without this peculiarity of structure. Unlike any work that is wholly true to the Aristotelian principle of indivisibility and isolation (or organic unity), the prose romances satisfy the first condition, but not the second: internal cohesion goes with a tendency to seek connections with other similar compositions and to absorb an increasingly vast number of new themes. Thus the prose *Tristan* brings together the stories of Tristan and Iseult, the rise and fall of Arthur's kingdom, and the Grail Quest. It early gave rise to an offshoot, the romance of *Palamède* (before 1240), which deals with the older generation of Arthur's knights. A similar example of "extension backward" is the *Perceforest*, which associates the beginnings of knighthood in Britain with both Brutus the Trojan (reputedly Aeneas' grandson and the legendary founder of Britain) and Alexander the Great and makes its hero, Perceforest, live long before the Christian era.

LATER DEVELOPMENTS

The Arthurian prose romances were influential in both Italy and Spain; and this favoured the development in these countries of works best described as *romans d'aventure*, with their constantly growing interest in tournaments, enchantments, single combat between knights, love intrigues, and rambling adventures. In Italy, early prose compilations of Old French epic material from the Charlemagne cycle were subsequently assimilated to the other great bodies of medieval French narrative fiction and infused with the spirit of Arthurian prose romance. The great Italian heroic and romantic epics, Matteo Boiardo's *Orlando innamorato* (1483) and Ludovico Ariosto's *Orlando furioso* (1516), are based on this fusion. The serious themes of the Holy Grail and death of Arthur left no mark in Italy. The romantic idealism of Boiardo and Ariosto exploits instead the worldly adventures and the love sentiment of Arthurian prose romance, recounted lightly and with a sophisticated humour.

The Spanish romance

In Spain the significant development is the appearance, as early as the 14th, or even the 13th, century, of a native prose romance, the *Amadís de Gaula*. Arthurian in spirit but not in setting and with a freely invented episodic content, this work, in the form given to it by Garci Rodríguez de Montalvo in its first known edition of 1508, captured the imagination of the polite society of western Europe by its blend of heroic and incredible feats of arms and tender sentiment and by its exaltation of an idealized and refined concept of chivalry. Quickly translated and adapted into French, Italian, Dutch, and English and followed by numerous sequels and imitations in Spanish and Portuguese, it remained influential for more than four centuries, greatly affecting the outlook and sensibility of western society. Cervantes parodied the fashion inspired by *Amadís* in *Don Quixote* (1605); but his admiration for the work itself caused him to introduce many of its features into his own masterpiece, so that the spirit and the character of chivalric romance may be said to have entered into the first great modern novel.

Parallels with sculpture and painting

More important still for the development of the novel form was the use made by romance writers of the technique of multiple thematic structure and "interweaving" earlier mentioned. Like the great examples of Romanesque ornamental art, both sculptural and pictorial, the cyclic romances of the late Middle Ages, while showing a strong sense of cohesion, bear no trace whatever of the classical concept of subordination to a single theme: an excellent proof, if proof were needed, of the limited relevance of this concept in literary aesthetics. Even those romances which, like the *Amadís* and its ancestor, the French prose *Lancelot*, had one great figure as the centre of action, cannot be said to have progressed in any way toward the notion of the unity of theme.

The spread and popularity of romance literature. This is as true of medieval romances as of their descendants, including the French and the English 18th-century novel and the pastoral romance, which, at the time of the Renaissance, revived the classical traditions of pastoral poetry and led to the appearance, in 1504, of the *Arcadia* by the Italian poet Jacopo Sannazzaro and, in about 1559, of the *Diana* by the Spanish poet and novelist Jorge de Montemayor. Both works were widely influential in translation, and each has claims to be regarded as the first pastoral romance, but in spirit *Diana* is the true inheritor of the romance tradition, giving it, in alliance with the pastoral, a new impetus and direction.

The social milieu

Medieval romance began in the 12th century when clerks, working for aristocratic patrons, often ladies of royal birth such as Eleanor of Aquitaine and her daughters, Marie de Champagne and Matilda, wife of Henry the Lion, duke of Saxony, began to write for a leisured and refined society. Like the courtly lyric, romance was a vehicle of a new aristocratic culture which, based in France, spread to other parts of western Europe. Translations and adaptations of French romances appear early in German: the *Roman d'Enéas*, in a version written by Heinrich von Veldeke before 1186, and the archetypal Tristan romance in Eilhart von Oberge's *Tristant* of *c.* 1170–80. In England many French romances were adapted, sometimes very freely, into English verse and prose from the late 13th to the 15th century; but by far the most important English contribution to the development and popularization of romance was the adaptation of a number of French Arthurian romances completed by Sir Thomas Malory in 1469–70 and published in 1485 by William Caxton under the title of *Le Morte Darthur*. In the Scandinavian countries the connection with the Angevin rulers of England led to importation of French romances in the reign (1217–63) of Haakon of Norway.

The decline of romance. As has been seen, in the later Middle Ages the prose romances were influential in France, Italy, and Spain, as well as in England; and the advent of the printed book made them available to a still wider audience. But although they continued in vogue into the 16th century, with the spread of the ideals of the New Learning, the greater range and depth of vernacular literature, and the rise of the neoclassical critics, the essentially medieval image of the perfect knight was bound to change into that of the scholar-courtier, who, as presented by the Italian Baldassare Castiglione in his *Il Cortegiano* (published 1528), embodies the highest moral ideals of the Renaissance. The new Spanish romances continued to enjoy international popularity until well into the 17th century and in France gave rise to compendious sentimental romances with an adventurous, pastoral, or pseudo-historical colouring popular with Parisian *salon* society until *c.* 1660. But the French intellectual climate, especially after the beginning of the so-called classical period in the 1660s, was unfavourable to the success of romance as a "noble" genre. Before disappearing, however, the romances lent the French form of their name to such *romans* as Antoine Furetière's *Le Roman bourgeois* (1666) and Paul Scarron's *Le Roman comique* (1651–57). These preserved something of the outward form of romance but little of its spirit; and while they transmitted the name to the kind of narrative fiction that succeeded them, they were in no sense intermediaries between its old and its new connotations. The great critical issue dominating the thought of western Europe from about 1660 onward was that of "truth" in literature; and romance, as being "unnatural" and unreasonable, was condemned. Only in England and Germany did it find a home with poets and novelists. Thus, while Robert Boyle, the natural philosopher, in his *Occasional Discourses* (1666) was inveighing against gentlemen whose libraries contained nothing more substantial than "romances," Milton, in *Paradise Lost*, could still invoke "what resounds/In fable or romance of Uther's son . . ."

The search for "truth" in literature

The 18th-century romantic revival. The 18th century in both England and Germany saw a strong reaction against the rationalistic canons of French classicism—a reaction that found its positive conterpart in such romantic material as had survived from medieval times. The Gothic romances, of which Horace Walpole's *Castle of Otranto* (1764; dated 1765) is the most famous, are perhaps of less importance than the ideas underlying the defense of romance by Richard Hurd in his *Letters on Chivalry and Romance* (1762). To Hurd, romance is not truth but a delightful and necessary holiday from common sense. This definition of romance (to which both Ariosto and Chrétien de Troyes would no doubt have subscribed) inspired on the one hand the romantic epic *Oberon* (1780) and on the other the historical romances of Sir Walter Scott. But influential though Scott's romantic novels may have been in every corner of Europe (including the Latin countries), it was the German and English Romantics who, with a richer theory of the imagination than Hurd's, were able to recapture something of the spirit and the structure of romance—the German Romantics by turning to their own medieval past; the English, by turning to the tradition perpetuated by Edmund Spenser and Shakespeare.

(E.Vi./F.Wh.)

Saga

In medieval Iceland the literary term saga denoted any kind of story or history in prose, irrespective of the kind or nature of the narrative or the purposes for which it was written. Used in this general sense, the term applies to a wide range of literary works, including those of hagiography (biography of saints), historiography, and secular fiction in a variety of modes. Lives of the saints and other stories for edification are entitled sagas, as are the Norse versions of French romances and the Icelandic adaptations of various Latin histories. Chronicles and other factual records of the history of Scandinavia and Iceland down to the 14th century are also included under the blanket term saga literature. In a stricter sense, however, the term saga is confined to legendary and historical fictions, in which the author has attempted an imaginative reconstruction of the past and organized the subject matter according to certain aesthetic principles. Using the distinctive features of the hero as principal guideline, medieval Icelandic narrative fiction can be classified as: (1) kings' sagas, (2) legendary sagas, and (3) sagas of Icelanders.

The origin and evolution of saga writing in Iceland are largely matters for speculation. A common pastime on

Icelandic farms, from the 12th century down to modern times, was the reading aloud of stories to entertain the household, known as *sagnaskemmtun* ("saga entertainment"). It seems to have replaced the traditional art of storytelling. All kinds of written narratives were used in *sagnaskemmtun:* secular, sacred, historical, and legendary. The Icelandic church took a sympathetic view of the writing and reading of sagas, and many of the authors whose identity is still known were monks or priests.

NONFICTIONAL SAGA LITERATURE

Translations. European narratives were known in Iceland in the 12th and 13th centuries and undoubtedly served as models for Icelandic writers when they set out to form a coherent picture of early Scandinavian history. Translations of lives of the saints and the apostles and accounts of the Holy Virgin testify to the skill of Icelandic prose writers in handling the vernacular for narrative purposes from the 12th century onward. Histories were also adapted and translated from Latin, based on those of the 7th- and 8th-century Anglo-Saxon writer Bede, the 7th-century Spanish historian Isidore of Seville, and others; on fictitious accounts of the Trojan wars, notably, one of the 5th century attributed to Dares Phrygius and one of the 4th century attributed to Dictys Cretensis; on the 12th-century British chronicler Geoffrey of Monmouth; and on the 1st-century Roman historians Sallust and Lucan. In the 13th century, Abbot Brandr Jónsson wrote a history of the Jews based on the Vulgate, on the 10th-century biblical scholar Peter Comestor, and on other sources.

In the 13th century, saga literature was also enriched by Norwegian prose translations of French romance literature. These soon found their way into Iceland, where they were popular and a strong influence on native storywriting. Probably the earliest, *Tristrams saga* (the story of Tristan and Iseult), was translated in 1226. Most of the themes of French romance appear in Icelandic versions; *e.g., Karlamagnús saga* was based on Charlemagne legends.

Themes of French romance literature

Native historical accounts. Icelandic historians seem to have started writing about their country's past toward the end of the 11th century. Saemundr Sigfússon, trained as a priest in France, wrote a Latin history of the kings of Norway, now lost but referred to by later authors. The first Icelander to use the vernacular for historical accounts was Ari Thorgilsson, whose *Íslendingabók* (or *Libellus Islandorum* [*The Book of the Icelanders*]) survives. It is a concise description of the course of Icelandic history from the beginning of the settlement (*c.* 870) to 1118. Ari seems to have written this book about 1125, but before that date he may already have compiled (in collaboration with Kolskeggr Ásbjarnarson) the so-called *Landnámabók* ("Book of Settlements"), which lists the names and land claims of about 400 settlers. Because this work survives only in 13th- and 14th-century versions, it is impossible to tell how much of it is Ari's. Both books gave the Icelanders a clear picture of the beginning of their society; both works served to stimulate public interest in the period during which events recounted in the sagas of Icelanders (see below) are supposed to have taken place. Other factual accounts of the history of Iceland followed later: *Kristni saga* describes Iceland's conversion to Christianity about the end of the 10th century and the emergence of a national church. *Hungrvaka* ("The Appetizer") contains accounts of the lives of the first five bishops of Skálholt, from the mid-11th to the third quarter of the 12th century; the biographies of other prominent bishops are in the *Biskupa sögur.* Though some of these have a strong hagiographical flavour, others are soberly written and of great historical value. The period *c.* 1100–1264 is also dealt with in several secular histories, known collectively as *Sturlunga saga,* the most important of which is the *Íslendinga saga* ("The Icelanders' Saga") of Sturla Thórdarson, who describes in memorable detail the bitter personal and political feuds that marked the final episode in the history of the Icelandic commonwealth (*c.* 1200–64).

LEGENDARY AND HISTORICAL FICTION

Kings' sagas. After Saemundr Sigfússon, Icelandic and Norwegian authors continued to explore the history of Scandinavia in terms of rulers and royal families, some of them writing in Latin and others in the vernacular. Broadly speaking, the kings' sagas fall into two distinct groups: contemporary (or near contemporary) biographies and histories of remoter periods. To the first group belonged a now-lost work, written in about 1170 by an Icelander called Eiríkr Oddsson, dealing with several 12th-century kings of Norway. *Sverris saga* describes the life of King Sverrir (reigned 1184–1202). The first part was written by Abbot Karl Jónsson under the supervision of the King himself, but it was completed (probably by the Abbot) in Iceland after Sverrir's death. Sturla Thórdarson wrote two royal biographies: *Hákonar saga* on King Haakon Haakonsson (*c.* 1204–63) and *Magnús saga* on his son and successor, Magnus VI Lawmender (Lagaboter; reigned 1263–80); of the latter only fragments survive. In writing these sagas Sturla used written documents as source material and, like Abbot Karl before him, he also relied on the accounts of eyewitnesses. Works on the history of the earlier kings of Norway include two Latin chronicles of Norwegian provenance, one of which was compiled *c.* 1180, and two vernacular histories, also written in Norway, the so-called *Ágrip* (*c.* 1190) and *Fagrskinna* (*c.* 1230). The Icelandic *Morkinskinna* (*c.* 1220) deals with the kings of Norway from 1047–1177; an outstanding feature of it is that it tells some brilliant stories of Icelandic poets and adventurers who visited the royal courts of Scandinavia.

Contemporary writings of remoter periods

The kings' sagas reached their zenith in the *Heimskringla,* or *Noregs konunga sögur* ("History of the Kings of Norway"), of Snorri Sturluson, which describes the history of the royal house of Norway from legendary times down to 1177. Snorri was a leading 13th-century Icelandic poet, who used as sources all the court poetry from the 9th century onward that was available to him. He also used many earlier histories of the kings of Norway and other written sources. *Heimskringla* is a supreme literary achievement that ranks Snorri Sturluson with the great writers of medieval Europe. He interpreted history in terms of personalities rather than politics, and many of his character portrayals are superbly drawn. Two of the early kings of Norway, Olaf Tryggvason (reigned 995–1000) and Olaf Haraldsson (Olaf the Saint; reigned 1015–30), received special attention from Icelandic antiquarians and authors. Only fragments of a 12th-century *Ólafs saga helga* ("St. Olaf's Saga") survive; a 13th-century biography of the same king by Styrmir Kárason is also largely lost. (Snorri Sturluson wrote a brilliant saga of St. Olaf, rejecting some of the grosser hagiographical elements in his sources; this work forms the central part of his *Heimskringla.*) About 1190 a Benedictine monk, Oddr Snorrason, wrote a Latin life of Olaf Tryggvason, of which an Icelandic version still survives. A brother in the same monastery, Gunnlaugr Leifsson, expanded this biography, and his work was incorporated into later versions of *Ólafs saga Tryggvasonar.* Closely related to the lives of the kings of Norway are *Færeyinga saga,* describing the resistance of Faeroese leaders to Norwegian interference during the first part of the 11th century, and *Orkneyinga saga,* dealing with the rulers of the earldom of Orkney from about 900 to the end of the 12th century. These two works were probably written about 1200. The history of the kings of Denmark from *c.* 940 to 1187 is told in *Knýtlinga saga.*

Legendary sagas. The learned men of medieval Iceland took great pride in their pagan past and copied traditional poems on mythological and legendary themes. In due course some of these narrative poems served as the basis for sagas in prose. In his *Edda* (probably written *c.* 1225), Snorri Sturluson tells several memorable stories, based on ancient mythological poems, about the old gods of the North, including such masterpieces as the tragic death of Balder and the comic tale of Thor's journey to giantland. Snorri's book also contains a summary of the legendary Nibelungen cycle. (A much fuller treatment of the same theme is to be found in *Völsunga saga* and *Thidriks saga,* the latter composed in Norway and based on German sources.) Other Icelandic stories based on early poetic tradition include *Heidreks saga; Hrólfs saga kraka,* which has a certain affinity with the Old English poem *Beowulf; Hálfs saga ok Hálfsrekka; Gautreks saga;* and *Ásmundar*

saga kappabana, which tells the same story as the Old High German *Hildebrandslied.* The term legendary sagas also covers a number of stories the antecedents and models of which are not exclusively native. These sagas are set in what might be called the legendary heroic age at one level and also vaguely in the more recent Viking age at the other, the action taking place in Scandinavia and other parts of the Viking world, from Russia to Ireland, but occasionally also in the world of myth and fantasy. It is mostly through valour and heroic exploits that the typical hero's personality is realized. He is, however, often a composite character, for some of his features are borrowed from a later and more refined ethos than that of early Scandinavia. He is in fact the synthesis of Viking ideals on the one hand and of codes of courtly chivalry on the other. Of individual stories the following are notable: *Egils saga ok Ásmundar,* which skillfully employs the flashback device; *Bósa saga ok Herrauds,* exceptional for its erotic elements; *Fridthjófs saga,* a romantic love story; *Hrólfs saga Gautrekssonar; Göngu-Hrólfs saga;* and *Halfdanar saga Eysteinssonar.* There are many more. The legendary sagas are essentially romantic literature, offering an idealized picture of the remote past, and many of them are strongly influenced by French romance literature. In these sagas the main emphasis is on a lively narrative, entertainment being their primary aim and function. Some of the themes in the legendary sagas are also treated in the *Gesta Danorum* of the 12th-century Danish historian Saxo Grammaticus, who states that some of his informants for the legendary history of Denmark were Icelanders.

Sagas of Icelanders. In the late 12th century, Icelandic authors began to fictionalize the early part of their history (*c.* 900–1050), and a new literary genre was born: the sagas of Icelanders. Whereas the ethos of the kings' sagas and of the legendary sagas is aristocratic and their principal heroes warlike leaders, the sagas of Icelanders describe characters who are essentially farmers or farmers' sons or at least people who were socially not far above the author's public, and their conduct and motivation are measurable in terms of the author's own ethos. These authors constantly aimed at geographic, social, and cultural verisimilitude; they made it their business to depict life in Iceland as they had experienced it or as they imagined it had actually been in the past. Though a good deal of the subject matter was evidently derived from oral tradition and thus of historical value for the period described, some of the best sagas are largely fictional; their relevance to the authors' own times mattered perhaps no less than their incidental information about the past. An important aim of this literature was to encourage people to attain a better understanding of their social environment and a truer knowledge of themselves through studying the real and imagined fates of their forbears. A spirit of humanism, sometimes coloured by a fatalistic heroic outlook, pervades the narrative. The edificatory role, however, was never allowed to get out of hand or dominate the literary art; giving aesthetic pleasure remained the saga writer's primary aim and duty.

Aim of the sagas of Icelanders

Nothing is known of the authorship of the sagas of Icelanders, and it has proved impossible to assign a definite date to many of them. It seems improbable that in their present form any of them could have been written before *c.* 1200. The period *c.* 1230–90 has been described as the golden age of saga writing because such masterpieces as *Egils saga, Víga-Glúms saga, Gísla saga, Eyrbyggja saga, Hrafnkels saga Freysgoda, Bandamanna saga, Hœnsa-Thóris saga,* and *Njáls saga* appear to have been written during that time. Although a number of sagas date from the 14th century, only one, *Grettis saga,* can be ranked with the classical ones.

The sagas of Icelanders can be subdivided into several categories according to the social and ethical status of the principal heroes. In some, the hero is a poet who sets out from the rural society of his native land in search of fame and adventure to become the retainer of the king of Norway or some other foreign ruler. Another feature of these stories is that the hero is also a lover. To this group belong some of the early-13th-century sagas, including *Kormáks saga, Hallfredar saga,* and *Bjarnar saga Hítdaelakappa.* In *Gunnlaugs saga ormstungu,* which may have been written after the middle of the 13th century, the love theme is treated more romantically than in the others. *Fostbraeda saga* ("The Blood-Brothers' Saga") describes two contrasting heroes: one a poet and lover, the other a ruthless killer. *Egils saga* offers a brilliant study of a complex personality—a ruthless Viking who is also a sensitive poet, a rebel against authority from early childhood who ends his life as a defenseless, blind old man. In several sagas the hero becomes an outlaw fighting a hopeless battle against the social forces that have rejected him. To this group belong *Hardar saga ok Hólmverja* and *Droplaugarsona saga;* but the greatest of the outlaw sagas are *Gísla saga,* describing a man who murders his own brother-in-law and whose sister reveals his dark secret; and *Grettis saga,* which deals with a hero of great talents and courage who is constantly fighting against heavy odds and is treacherously slain by an unscrupulous enemy.

Most of the sagas of Icelanders, however, are concerned with people who are fully integrated members of society, either as ordinary farmers or as farmers who also act as chieftains. *Hrafnkels saga* describes a chieftain who murders his shepherd, is then tortured and humiliated for his crime, and finally takes cruel revenge on one of his tormentors. The hero who gives his name to *Hœnsa-Thoris saga* is a man of humble background who makes money as a peddler and becomes a wealthy but unpopular landowner. His egotism creates trouble in the neighbourhood, and after he has set fire to one of the farmsteads, killing the farmer and the entire household, he is prosecuted and later put to death. *Ölkofra tháttr* (the term *tháttr* is often used for a short story) and *Bandamanna saga* ("The Confederates' Saga") satirize chieftains who fail in their duty to guard the integrity of the law and try to turn other people's mistakes into profit for themselves. The central plot in *Laxdœla saga* is a love triangle, in which the jealous heroine forces her husband to kill his best friend. *Eyrbyggja saga* describes a complex series of feuds between several interrelated families; *Hávardar saga* is about an old farmer who takes revenge on his son's killer, the local chieftain; *Víga-Glúms saga* tells of a ruthless chieftain who commits several killings and swears an ambiguous oath in order to cover his guilt; while *Vatnsdœla saga* is the story of a noble chieftain whose last act is to help his killer escape.

In the sagas of Icelanders justice, rather than courage, is often the primary virtue, as might be expected in a literature that places the success of an individual below the welfare of society at large. This theme is an underlying one in *Njáls saga,* the greatest of all the sagas. It is a story of great complexity and richness, with a host of brilliantly executed character portrayals and a profound understanding of human strengths and weaknesses. Its structure is highly complex, but at its core is the tragedy of an influential farmer and sage who devotes his life to a hopeless struggle against the destructive forces of society but ends it inexorably when his enemies set fire to his house, killing his wife and sons with him. (Hc.P.)

Theme of *Njáls saga*

Novel

The novel is a genre of fiction, and fiction may be defined as the art or craft of contriving, through the written word, representations of human life that instruct or divert or both. The various forms that fiction may take are best seen less as a number of separate categories than as a continuum or, more accurately, a cline, with some such brief form as the anecdote at one end of the scale and the longest conceivable novel at the other. When any piece of fiction is long enough to constitute a whole book, as opposed to a mere part of a book, then it may be said to have achieved novelhood. But this state admits of its own quantitative categories, so that a relatively brief novel may be termed a novella (or, if the insubstantiality of the content matches its brevity, a novelette), and a very long novel may overflow the banks of a single volume and become a *roman-fleuve,* or river novel. Length is very much one of the dimensions of the genre.

The term novel is a truncation of the Italian word *novella*

(from the plural of Latin *novellus,* a late variant of *novus,* meaning "new"), so that what is now, in most languages, a diminutive denotes historically the parent form. The *novella* was a kind of enlarged anecdote like those to be found in the 14th-century Italian classic Boccaccio's *Decameron,* each of which exemplifies the etymology well enough. The stories are little new things, novelties, freshly minted diversions, toys; they are not reworkings of known fables or myths, and they are lacking in weight and moral earnestness. It is to be noted that, despite the high example of novelists of the most profound seriousness, such as Tolstoy, Henry James, and Virginia Woolf, the term novel still, in some quarters, carries overtones of lightness and frivolity. And it is possible to descry a tendency to triviality in the form itself. The ode or symphony seems to possess an inner mechanism that protects it from aesthetic or moral corruption, but the novel can descend to shameful commercial depths of sentimentality or pornography. It is the purpose of this section to consider the novel not solely in terms of great art but also as an all-purpose medium catering for all the strata of literacy.

The novel and the epic compared

Such early ancient Roman fiction as Petronius' *Satyricon* of the 1st century AD and Lucius Apuleius' *Golden Ass* of the 2nd century contain many of the popular elements that distinguish the novel from its nobler born relative the epic poem. In the fictional works, the medium is prose, the events described are unheroic, the settings are streets and taverns, not battlefields and palaces. There is more low fornication than princely combat; the gods do not move the action; the dialogue is homely rather than aristocratic. It was, in fact, out of the need to find—in the period of Roman decline—a literary form that was anti-epic in both substance and language that the first prose fiction of Europe seems to have been conceived. The most memorable character in Petronius is a *nouveau riche* vulgarian; the hero of Lucius Apuleius is turned into a donkey; nothing less epic can well be imagined.

The medieval chivalric romance (from a popular Latin word, probably *Romanice,* meaning written in the vernacular, not in traditional Latin) restored a kind of epic view of man—though now as heroic Christian, not heroic pagan. At the same time, it bequeathed its name to the later genre of continental literature, the novel, which is known in French as *roman,* in Italian as *romanzo,* etc. (The English term romance, however, carries a pejorative connotation.) But that later genre achieved its first great flowering in Spain at the beginning of the 17th century in an antichivalric comic masterpiece—the *Don Quixote* of Cervantes, which, on a larger scale than the *Satyricon* or *The Golden Ass,* contains many of the elements that have been expected from prose fiction ever since. Novels have heroes, but not in any classical or medieval sense. As for the novelist, he must, in the words of the contemporary British-American W.H. Auden,

> Become the whole of boredom, subject to
> Vulgar complaints like love, among the Just
> Be just, among the Filthy filthy too,
> And in his own weak person, if he can,
> Must suffer dully all the wrongs of Man.

The novel attempts to assume those burdens of life that have no place in the epic poem and to see man as unheroic, unredeemed, imperfect, even absurd. This is why there is room among its practitioners for writers of hard-boiled detective thrillers such as the contemporary American Mickey Spillane or of sentimental melodramas such as the prolific 19th-century English novelist Mrs. Henry Wood, but not for one of the unremitting elevation of outlook of a John Milton.

The reader may also be interested in the analogous treatment of a comparable genre in the section *Short story* which follows. Critical approaches are discussed in the section *Literary criticism* below.

ELEMENTS

Plot. The novel is propelled through its hundred or thousand pages by a device known as the story or plot. This is frequently conceived by the novelist in very simple terms, a mere nucleus, a jotting on an old envelope: for example, Charles Dickens' *Christmas Carol* (1843) might have been conceived as "a misanthrope is reformed through certain magical visitations on Christmas Eve," or Jane Austen's *Pride and Prejudice* (1813) as "a young couple destined to be married have first to overcome the barriers of pride and prejudice," or Fyodor Dostoyevsky's *Crime and Punishment* (1866) as "a young man commits a crime and is slowly pursued in the direction of his punishment." The detailed working out of the nuclear idea requires much ingenuity, since the plot of one novel is expected to be somewhat different from that of another, and there are very few basic human situations for the novelist to draw upon. The dramatist may take his plot ready-made from fiction or biography—a form of theft sanctioned by Shakespeare—but the novelist has to produce what look like novelties.

Original and borrowed plots

The example of Shakespeare is a reminder that the ability to create an interesting plot, or even any plot at all, is not a prerequisite of the imaginative writer's craft. At the lowest level of fiction, plot need be no more than a string of stock devices for arousing stock responses of concern and excitement in the reader. The reader's interest may be captured at the outset by the promise of conflicts or mysteries or frustrations that will eventually be resolved, and he will gladly—so strong is his desire to be moved or entertained—suspend criticism of even the most trite modes of resolution. In the least sophisticated fiction, the knots to be untied are stringently physical, and the denouement often comes in a sort of triumphant violence. Serious fiction prefers its plots to be based on psychological situations, and its climaxes come in new states of awareness—chiefly self-knowledge—on the parts of the major characters.

Melodramatic plots, plots dependent on coincidence or improbability, are sometimes found in even the most elevated fiction; E.M. Forster's *Howards End* (1910) is an example of a classic British novel with such a plot. But the novelist is always faced with the problem of whether it is more important to represent the formlessness of real life (in which there are no beginnings and no ends and very few simple motives for action) or to construct an artifact as well balanced and economical as a table or chair; since he is an artist, the claims of art, or artifice, frequently prevail.

There are, however, ways of constructing novels in which plot may play a desultory part or no part at all. The traditional picaresque novel—a novel with a rogue as its central character—like Alain Lesage's *Gil Blas* (1715) or Henry Fielding's *Tom Jones* (1749), depends for movement on a succession of chance incidents. In the works of Virginia Woolf, the consciousness of the characters, bounded by some poetic or symbolic device, sometimes provides all the fictional material. Marcel Proust's great *roman-fleuve, À la recherche du temps perdu* (1913–27; *Remembrance of Things Past*), has a metaphysical framework derived from the time theories of the philosopher Henri Bergson, and it moves toward a moment of truth that is intended to be literally a revelation of the nature of reality. Strictly, any scheme will do to hold a novel together—raw action, the hidden syllogism of the mystery story, prolonged solipsist contemplation—so long as the actualities or potentialities of human life are credibly expressed, with a consequent sense of illumination, or some lesser mode of artistic satisfaction, on the part of the reader.

Character. The inferior novelist tends to be preoccupied with plot; to the superior novelist the convolutions of the human personality, under the stress of artfully selected experience, are the chief fascination. Without character it was once accepted that there could be no fiction. In the period since World War II, the creators of what has come to be called the French *nouveau roman* (*i.e.,* new novel) have deliberately demoted the human element, claiming the right of objects and processes to the writer's and reader's prior attention. Thus, in books termed *chosiste* (literally "thing-ist"), they make the furniture of a room more important than its human incumbents. This may be seen as a transitory protest against the long predominance of character in the novel, but, even on the popular level, there have been indications that readers can be held by things as much as by characters. Henry James could be

Objects as "characters"

vague in *The Ambassadors* (1903) about the provenance of his chief character's wealth; if he wrote today he would have to give his readers a tour around the factory or estate. The popularity of much undistinguished but popular fiction has nothing to do with its wooden characters; it is machines, procedures, organizations that draw the reader. The success of Ian Fleming's British spy stories in the 1960s had much to do with their hero, James Bond's car, gun, and preferred way of mixing a martini.

But the true novelists remain creators of characters—prehuman, such as those in William Golding's *Inheritors* (1955); animal, as in Henry Williamson's *Tarka the Otter* (1927) or Jack London's *Call of the Wild* (1903); caricatures, as in much of Dickens; or complex and unpredictable entities, as in Tolstoy, Dostoyevsky, or Henry James. The reader may be prepared to tolerate the most wanton-seeming stylistic tricks and formal difficulties because of the intense interest of the central characters in novels as diverse as James Joyce's *Ulysses* (1922) and *Finnegans Wake* (1939) and Laurence Sterne's *Tristram Shandy* (1760–67).

Characters as symbols

It is the task of literary critics to create a value hierarchy of fictional character, placing the complexity of the Shakespearean view of man—as found in the novels of Tolstoy and Joseph Conrad—above creations that may be no more than simple personifications of some single characteristic, like some of those by Dickens. It frequently happens, however, that the common reader prefers surface simplicity—easily memorable cartoon figures like Dickens' never-despairing Mr. Micawber and devious Uriah Heep—to that wider view of personality, in which character seems to engulf the reader, subscribed to by the great novelists of France and Russia. The whole nature of human identity remains in doubt, and writers who voice that doubt—like the French exponents of the *nouveau roman* Alain Robbe-Grillet and Nathalie Sarraute, as well as many others—are in effect rejecting a purely romantic view of character. This view imposed the author's image of himself—the only human image he properly possessed—on the rest of the human world. For the unsophisticated reader of fiction, any created personage with a firm position in time–space and the most superficial parcel of behavioral (or even sartorial) attributes will be taken for a character. Though the critics may regard it as heretical, this tendency to accept a character is in conformity with the usages of real life. The average person has at least a suspicion of his own complexity and inconsistency of makeup, but he sees the rest of the world as composed of much simpler entities. The result is that novels whose characters are created out of the author's own introspection are frequently rejected as not "true to life." But both the higher and the lower orders of novel readers might agree in condemning a lack of memorability in the personages of a work of fiction, a failure on the part of the author to seem to add to the reader's stock of remembered friends and acquaintances. Characters that seem, on recollection, to have a life outside the bounds of the books that contain them are usually the ones that earn their creators the most regard. Depth of psychological penetration, the ability to make a character real as oneself, seems to be no primary criterion of fictional talent.

Scene, or setting. The makeup and behaviour of fictional characters depend on their environment quite as much as on the personal dynamic with which their author endows them: indeed, in Émile Zola, environment is of overriding importance, since he believed it determined character. The entire action of a novel is frequently determined by the locale in which it is set. Thus, Gustave Flaubert's *Madame Bovary* (1857) could hardly have been placed in Paris, because the tragic life and death of the heroine have a great deal to do with the circumscriptions of her provincial milieu. But it sometimes happens that the main locale of a novel assumes an importance in the reader's imagination comparable to that of the characters and yet somehow separable from them. Wessex is a giant brooding presence in Thomas Hardy's novels, whose human characters would probably not behave much differently if they were set in some other rural locality of England. The popularity of Sir Walter Scott's "Waverley" novels is due in part to their evocation of a romantic Scotland. Setting may be the prime consideration of some readers, who can be drawn to Conrad because he depicts life at sea or in the East Indies; they may be less interested in the complexity of human relationships that he presents.

Regional novels

The regional novel is a recognized species. The sequence of four novels that Hugh Walpole began with *Rogue Heries* (1930) was the result of his desire to do homage to the part of Cumberland, in England, where he had elected to live. The great Yoknapatawpha cycle of William Faulkner, a classic of 20th-century American literature set in an imaginary county in Mississippi, belongs to the category as much as the once-popular confections about Sussex that were written about the same time by the English novelist Sheila Kaye-Smith. Many novelists, however, gain a creative impetus from avoiding the same setting in book after book and deliberately seeking new locales. The English novelist Graham Greene apparently needed to visit a fresh scene in order to write a fresh novel. His ability to encapsulate the essence of an exotic setting in a single book is exemplified in *The Heart of the Matter* (1948); his contemporary Evelyn Waugh stated that the West Africa of that book replaced the true remembered West Africa of his own experience. Such power is not uncommon: the Yorkshire moors have been romanticized because Emily Brontë wrote of them in *Wuthering Heights* (1847), and literary tourists have visited Stoke-on-Trent, in northern England, because it comprises the "Five Towns" of Arnold Bennett's novels of the early 20th century. Others go to the Monterey, California, of John Steinbeck's novels in the expectation of experiencing a *frisson* added to the locality by an act of creative imagination. James Joyce, who remained inexhaustibly stimulated by Dublin, has exalted that city in a manner that even the guidebooks recognize.

The setting of a novel is not always drawn from a real-life locale. The literary artist sometimes prides himself on his ability to create the totality of his fiction—the setting as well as the characters and their actions. In the Russian expatriate Vladimir Nabokov's *Ada* (1969) there is an entirely new space–time continuum, and the English scholar J.R.R. Tolkien in his *Lord of the Rings* (1954–55) created an "alternative world" that appeals greatly to many who are dissatisfied with the existing one. The world of interplanetary travel was imaginatively created long before the first moon landing. The properties of the future envisaged by H.G. Wells's novels or by Aldous Huxley in *Brave New World* (1932) are still recognized in an age that those authors did not live to see. The composition of place can be a magical fictional gift.

Whatever the locale of his work, every true novelist is concerned with making a credible environment for his characters, and this really means a close attention to sense data—the immediacies of food and drink and colour—far more than abstractions like "nature" and "city." The London of Charles Dickens is as much incarnated in the smell of wood in lawyers' chambers as in the skyline and vistas of streets.

Narrative method and point of view. Where there is a story, there is a storyteller. Traditionally, the narrator of the epic and mock-epic alike acted as an intermediary between the characters and the reader; the method of Fielding is not very different from the method of Homer. Sometimes the narrator boldly imposed his own attitudes; always he assumed an omniscience that tended to reduce the characters to puppets and the action to a predetermined course with an end implicit in the beginning. Many novelists have been unhappy about a narrative method that seems to limit the free will of the characters, and innovations in fictional technique have mostly sought the objectivity of the drama, in which the characters appear to work out their own destinies without prompting from the author.

The epistolary method, most notably used by Samuel Richardson in *Pamela* (1740) and by Jean-Jacques Rousseau in *La nouvelle Héloïse* (1761), has the advantage of allowing the characters to tell the story in their own words, but it is hard to resist the uneasy feeling that a kind of divine editor is sorting and ordering the letters into his own pattern. The device of making the

narrator also a character in the story has the disadvantage of limiting the material available for the narration, since the narrator-character can know only those events in which he participates. There can, of course, be a number of secondary narratives enclosed in the main narrative, and this device—though it sometimes looks artificial—has been used triumphantly by Conrad and, on a lesser scale, by W. Somerset Maugham. A, the main narrator, tells what he knows directly of the story and introduces what B and C and D have told him about the parts that he does not know.

Seeking the most objective narrative method of all, Ford Madox Ford used, in *The Good Soldier* (1915), the device of the storyteller who does not understand the story he is telling. This is the technique of the "unreliable observer." The reader, understanding better than the narrator, has the illusion of receiving the story directly. Joyce, in both his major novels, uses different narrators for the various chapters. Most of them are unreliable, and some of them approach the impersonality of a sort of disembodied parody. In *Ulysses,* for example, an episode set in a maternity hospital is told through the medium of a parodic history of English prose style. But, more often than not, the sheer ingenuity of Joyce's techniques draws attention to the manipulator in the shadows. The reader is aware of the author's cleverness where he should be aware only of the characters and their actions. The author is least noticeable when he is employing the stream of consciousness device, by which the inchoate thoughts and feelings of a character are presented in interior monologue—apparently unedited and sometimes deliberately near-unintelligible. It is because this technique seems to draw fiction into the psychoanalyst's consulting room (presenting the raw material of either art or science, but certainly not art itself), however, that Joyce felt impelled to impose the shaping devices referred to above. Joyce, more than any novelist, sought total objectivity of narration technique but ended as the most subjective and idiosyncratic of stylists.

The presence of the author

The problem of a satisfactory narrative point of view is, in fact, nearly insoluble. The careful exclusion of comment, the limitation of vocabulary to a sort of reader's lowest common denominator, the paring of style to the absolute minimum—these puritanical devices work well for an Ernest Hemingway (who, like Joyce, remains, nevertheless, a highly idiosyncratic stylist) but not for a novelist who believes that, like poetry, his art should be able to draw on the richness of word play, allusion, and symbol. For even the most experienced novelist, each new work represents a struggle with the unconquerable task of reconciling all-inclusion with self-exclusion. It is noteworthy that Cervantes, in *Don Quixote,* and Nabokov, in *Lolita* (1955), join hands across four centuries in finding most satisfactory the device of the fictitious editor who presents a manuscript story for which he disclaims responsibility. But this highly useful method presupposes in the true author a scholarly, or pedantic, faculty not usually associated with novelists.

Scope, or dimension. No novel can theoretically be too long, but if it is too short it ceases to be a novel. It may or may not be accidental that the novels most highly regarded by the world are of considerable length—Cervantes' *Don Quixote,* Dostoyevsky's *Brothers Karamazov,* Tolstoy's *War and Peace,* Dickens' *David Copperfield,* Proust's *À la recherche du temps perdu,* and so on. On the other hand, since World War II, brevity has been regarded as a virtue in works like the later novels of the Irish absurdist author Samuel Beckett and the *ficciones* of the Argentine Jorge Luis Borges, and it is only an aesthetic based on bulk that would diminish the achievement of Ronald Firbank's short novels of the post-World War I era or the Evelyn Waugh who wrote *The Loved One* (1948). It would seem that there are two ways of presenting human character—one, the brief way, through a significant episode in the life of a personage or group of personages; the other, which admits of limitless length, through the presentation of a large section of a life or lives, sometimes beginning with birth and ending in old age. The plays of Shakespeare show that a full delineation of character can be effected in a very brief compass, so that, for this aspect of the novel, length confers no special advantage. Length, however, is essential when the novelist attempts to present something bigger than character—when, in fact, he aims at the representation of a whole society or period of history.

No other cognate art form—neither the epic poem nor the drama nor the film—can match the resources of the novel when the artistic task is to bring to immediate, sensuous, passionate life the somewhat impersonal materials of the historian. *War and Peace* is the great triumphant example of the panoramic study of a whole society—that of early 19th-century Russia—which enlightens as the historian enlightens and yet also conveys directly the sensations and emotions of living through a period of cataclysmic change. In the 20th century, another Russian, Boris Pasternak, in his *Doctor Zhivago* (1957), expressed—though on a less than Tolstoyan scale—the personal immediacies of life during the Russian Revolution. Though of much less literary distinction than either of these two books, Margaret Mitchell's *Gone with the Wind* (1936) showed how the American Civil War could assume the distanced pathos, horror, and grandeur of any of the classic struggles of the Old World.

Needless to say, length and weighty subject matter are no guarantee in themselves of fictional greatness. Among American writers, for example, James Jones's celebration of the U.S. Army on the eve of World War II in *From Here to Eternity* (1951), though a very ambitious project, repels through indifferent writing and sentimental characterization; Norman Mailer's *Naked and the Dead* (1948), an equally ambitious military novel, succeeds much more because of a tautness, a concern with compression, and an astringent objectivity that Jones was unable to match. Frequently the size of a novel is too great for its subject matter—as with Marguerite Young's *Miss MacIntosh, My Darling* (1965), reputedly the longest single-volume novel of the 20th century, John Barth's *Giles Goat-Boy* (1966), and John Fowles's *Magus* (1965). Diffuseness is the great danger in the long novel, and diffuseness can mean slack writing, emotional self-indulgence, sentimentality.

Even the long picaresque novel—which, in the hands of a Fielding or his contemporary Tobias Smollett, can rarely be accused of sentimentality—easily betrays itself into such acts of self-indulgence as the multiplication of incident for its own sake, the coy digression, the easygoing jogtrot pace that subdues the sense of urgency that should lie in all fiction. If Tolstoy's *War and Peace* is a greater novel than Fielding's *Tom Jones* or Dickens' *David Copperfield,* it is not because its theme is nobler, or more pathetic, or more significant historically; it is because Tolstoy brings to his panoramic drama the compression and urgency usually regarded as the monopolies of briefer fiction.

Works in several books

Sometimes the scope of a fictional concept demands a technical approach analogous to that of the symphony in music—the creation of a work in separate books, like symphonic movements, each of which is intelligible alone but whose greater intelligibility depends on the theme and characters that unify them. The French author Romain Rolland's *Jean-Christophe* (1904–12) sequence is, very appropriately since the hero is a musical composer, a work in four movements. Among works of English literature, Lawrence Durrell's *Alexandria Quartet* (1957–60) insists in its very title that it is a tetralogy rather than a single large entity divided into four volumes; the concept is "relativist" and attempts to look at the same events and characters from four different viewpoints. Anthony Powell's *Dance to the Music of Time,* a multivolume series of novels that began in 1951 (collected 1962), may be seen as a study of a segment of British society in which the chronological approach is eschewed, and events are brought together in one volume or another because of a kind of parachronic homogeneity. C.P. Snow's *Strangers and Brothers,* a comparable series that began in 1940 and continued to appear throughout the '50s and into the '60s, shows how a fictional concept can be realized only in the act of writing, since the publication of the earlier volumes antedates the historical events portrayed in later ones. In other words, the author could not know what the subject matter of the sequence would be until he was in sight of its end. Behind all these works lies the giant example of

Proust's *roman-fleuve*, whose length and scope were properly coterminous with the author's own life and emergent understanding of its pattern.

Myth, symbolism, significance. The novelist's conscious day-to-day preoccupation is the setting down of incident, the delineation of personality, the regulation of exposition, climax, and denouement. The aesthetic value of the work is frequently determined by subliminal forces that seem to operate independently of the writer, investing the properties of the surface story with a deeper significance. A novel will then come close to myth, its characters turning into symbols of permanent human states or impulses, particular incarnations of general truths perhaps only realized for the first time in the act of reading. The ability to perform a quixotic act anteceded *Don Quixote*, just as *bovarysme* existed before Flaubert found a name for it.

But the desire to give a work of fiction a significance beyond that of the mere story is frequently conscious and deliberate, indeed sometimes the primary aim. When a novel—like Joyce's *Ulysses* or John Updike's *Centaur* (1963) or Anthony Burgess' *Vision of Battlements* (1965)—is based on an existing classical myth, there is an intention of either ennobling a lowly subject matter, satirizing a debased set of values by referring them to a heroic age, or merely providing a basic structure to hold down a complex and, as it were, centrifugal picture of real life. Of *Ulysses* Joyce said that his Homeric parallel (which is worked out in great and subtle detail) was a bridge across which to march his 18 episodes; after the march the bridge could be "blown skyhigh." But there is no doubt that, through the classical parallel, the account of an ordinary summer day in Dublin is given a richness, irony, and universality unattainable by any other means.

The mythic or symbolic intention of a novel may manifest itself less in structure than in details which, though they appear naturalistic, are really something more. The shattering of the eponymous golden bowl in Henry James's 1904 novel makes palpable, and hence truly symbolic, the collapse of a relationship. Even the choice of a character's name may be symbolic. Sammy Mountjoy, in William Golding's *Free Fall* (1959), has fallen from the grace of heaven, the mount of joy, by an act of volition that the title makes clear. The eponym of *Doctor Zhivago* is so called because his name, meaning "The Living," carries powerful religious overtones. In the Russian version of the Gospel According to St. Luke, the angels ask the women who come to Christ's tomb: *"Chto vy ischyote zhivago mezhdu myortvykh?"*—"Why do you seek the living among the dead?" And his first name, Yuri, the Russian equivalent of George, has dragon-slaying connotations.

The symbolism of names

The symbol, the special significance at a subnarrative level, works best when it can fit without obtrusion into a context of naturalism. The optician's trade sign of a huge pair of spectacles in F. Scott Fitzgerald's *Great Gatsby* (1925) is acceptable as a piece of scenic detail, but an extra dimension is added to the tragedy of Gatsby, which is the tragedy of a whole epoch in American life, when it is taken also as a symbol of divine myopia. Similarly, a cinema poster in Malcolm Lowry's *Under the Volcano* (1947), advertising a horror film, can be read as naturalistic background, but it is evident that the author expects the illustrated fiend—a concert pianist whose grafted hands are those of a murderer—to be seen also as a symbol of Nazi infamy; the novel is set at the beginning of World War II, and the last desperate day of the hero, Geoffrey Firmin, stands also for the collapse of Western civilization.

There are symbolic novels whose infranarrative meaning cannot easily be stated, since it appears to subsist on an unconscious level. Herman Melville's *Moby Dick* (1851) is such a work, as is D.H. Lawrence's novella *St. Mawr* (1925), in which the significance of the horse is powerful and mysterious.

USES

Interpretation of life. Novels are not expected to be didactic, like tracts or morality plays; nevertheless, in varying degrees of implicitness, even the "purest" works of fictional art convey a philosophy of life. The novels of Jane Austen, designed primarily as superior entertainment, imply a desirable ordered existence, in which the comfortable decorum of an English rural family is disturbed only by a not-too-serious shortage of money, by love affairs that go temporarily wrong, and by the intrusion of self-centred stupidity. The good, if unrewarded for their goodness, suffer from no permanent injustice. Life is seen, not only in Jane Austen's novels but in the whole current of bourgeois Anglo-American fiction, as fundamentally reasonable and decent. When wrong is committed, it is usually punished, thus fulfilling Miss Prism's summation in Oscar Wilde's play *The Importance of Being Earnest* (1895), to the effect that in a novel the good characters end up happily and the bad characters unhappily: "that is why it is called fiction."

That kind of fiction called realistic, which has its origins in 19th-century France, chose the other side of the coin, showing that there was no justice in life and that the evil and the stupid must prevail. In the novels of Thomas Hardy there is a pessimism that may be taken as a corrective of bourgeois Panglossianism—the philosophy that everything happens for the best, satirized in Voltaire's *Candide* (1759)—since the universe is presented as almost impossibly malevolent. This tradition is regarded as morbid, and it has been deliberately ignored by most popular novelists. The "Catholic" novelists—such as François Mauriac in France, Graham Greene in England, and others—see life as mysterious, full of wrong and evil and injustice inexplicable by human canons but necessarily acceptable in terms of the plans of an inscrutable God. Between the period of realistic pessimism, which had much to do with the agnosticism and determinism of 19th-century science, and the introduction of theological evil into the novel, writers such as H.G. Wells attempted to create a fiction based on optimistic liberalism. As a reaction, there was the depiction of "natural man" in the novels of D.H. Lawrence and Ernest Hemingway.

Realistic pessimism

For the most part, the view of life common to American and European fiction since World War II posits the existence of evil—whether theological or of that brand discovered by the French Existentialists, particularly Jean-Paul Sartre—and assumes that man is imperfect and life possibly absurd. The fiction of the former Communist Europe was based on a very different assumption, one that seems naïve and old-fashioned in its collective optimism to readers in the disillusioned democracies. It is to be noted that in the erstwhile Soviet Union aesthetic evaluation of fiction was replaced by ideological judgment. Accordingly, the works of the popular British writer A.J. Cronin, since they seem to depict personal tragedy as an emanation of capitalistic infamy, were rated higher than those of Conrad, James, and their peers.

Entertainment or escape. In a period that takes for granted that the written word should be "committed"—to the exposure of social wrong or the propagation of progressive ideologies—novelists who seek merely to take the reader out of his dull or oppressive daily life are not highly regarded, except by that reading public that has never expected a book to be anything more than a diversion. Nevertheless, the provision of laughter and dreams has been for many centuries a legitimate literary occupation. It can be condemned by serious devotees of literature only if it falsifies life through oversimplification and tends to corrupt its readers into belief that reality is as the author presents it. The novelettes once beloved of mill girls and domestic servants, in which the beggar maid was elevated to queendom by a king of high finance, were a mere narcotic, a sort of enervating opium of the oppressed; the encouragement of such subliterature might well be one of the devices of social oppression. Adventure stories and spy novels may have a healthy enough astringency, and the very preposterousness of some adventures can be a safeguard against any impressionable young reader's neglecting the claims of real life to dream of becoming a secret agent. The subject matter of some humorous novels—such as the effete British aristocracy created by P.G. Wodehouse, which is no longer in existence if it ever was—can never be identified with a real human society; the dream is accepted as a dream. The same may be said of Evelyn Waugh's early novels—such as *Decline and Fall* (1928) and *Vile Bodies* (1930)—but these are raised

above mere entertainment by touching, almost incidentally, on real human issues (the relation of the innocent to a circumambient malevolence is a persistent theme in all Waugh's writing).

Any reader of fiction has a right to an occasional escape from the dullness or misery of his existence, but he has the critical duty of finding the best modes of escape—in the most efficiently engineered detective or adventure stories, in humour that is more than sentimental buffoonery, in dreams of love that are not mere pornography. The fiction of entertainment and escape frequently sets itself higher literary standards than novels with a profound social or philosophical purpose. Books like John Buchan's *Thirty-nine Steps* (1915), Graham Greene's *Travels with My Aunt* (1969), Dashiell Hammett's *Maltese Falcon* (1930), and Raymond Chandler's *Big Sleep* (1939) are distinguished pieces of writing that, while diverting and enthralling, keep a hold on the realities of human character. Ultimately, all good fiction is entertainment, and, if it instructs or enlightens, it does so best through enchanting the reader.

Propaganda. The desire to make the reader initiate certain acts—social, religious, or political—is the essence of all propaganda, and, though it does not always accord well with art, the propagandist purpose has often found its way into novels whose prime value is an aesthetic one. The *Nicholas Nickleby* (1839) of Charles Dickens attacked the abuses of schools to some purpose, as his *Oliver Twist* (1838) drew attention to the horrors of poorhouses and his *Bleak House* (1853) to the abuses of the law of chancery. The weakness of propaganda in fiction is that it loses its value when the wrongs it exposes are righted, so that the more successful a propagandist novel is, the briefer the life it can be expected to enjoy. The genius of Dickens lay in his ability to transcend merely topical issues through the vitality with which he presented them, so that his contemporary disclosures take on a timeless human validity—chiefly through the power of their drama, character, and rhetoric.

The ephemeral quality of propaganda

The pure propagandist novel—which Dickens was incapable of writing—quickly becomes dated. The "social" novels of H.G. Wells, which propounded a rational mode of life and even blueprinted utopias, were very quickly exploded by the conviction of man's irredeemable irrationality that World War I initiated and World War II corroborated, a conviction the author himself came to share toward the end of his life. But the early scientific romances of Wells remain vital and are seen to have been prophetic. Most of the fiction of the former Soviet Union, which either glorified the regime or refrained from criticizing it, was dull and unreal, and the same can be said of Communist fiction elsewhere. Propaganda too frequently ignores man as a totality, concentrating on him aspectively—in terms of politics or sectarian religion. When a didactic attack on a system, as in Harriet Beecher Stowe's attack on slavery in the United States in *Uncle Tom's Cabin* (1852), seems to go beyond mere propaganda, it is because the writer makes the reader aware of wrongs and injustices that are woven into the permanent human fabric. The reader's response may be a modification of his own sensibility, not an immediate desire for action, and this is one of the legitimate effects of serious fiction. The propagandist Dickens calls for the immediate righting of wrongs, but the novelist Dickens says, mainly through implication, that all men—not just schoolmasters and state hirelings—should become more humane. If it is possible to speak of art as possessing a teaching purpose, this is perhaps its only lesson.

Reportage. The division in the novelist's mind is between his view of his art as a contrivance, like a Fabergé watch, and his view of it as a record of real life. The versatile English writer Daniel Defoe, on the evidence of such novels as his *Journal of the Plague Year* (1722), a recreation of the London plague of 1665, believed that art or contrivance had the lesser claim and proceeded to present his account of events of which he had had no direct experience in the form of plain journalistic reportage. This book, like his *Robinson Crusoe* (1719) and *Moll Flanders* (1722), is more contrived and cunning than it appears, and the hurried, unshaped narrative is the product of careful preparation and selective ordering. His example, which could have been a very fruitful one, was not much followed until the 20th century, when the events of the real world became more terrifying and marvellous than anything the novelist could invent and seemed to ask for that full imaginative treatment that only the novelist's craft can give.

In contemporary American literature, John Hersey's *Hiroshima* (1946), though it recorded the actual results of the nuclear attack on the Japanese city in 1945, did so in terms of human immediacies, not scientific or demographic abstractions, and this approach is essentially novelistic. Truman Capote's *In Cold Blood* (1966) took the facts of a multiple murder in the Midwest of the United States and presented them with the force, reality, tone, and (occasionally) overintense writing that distinguish his genuine fiction. Norman Mailer, in *The Armies of the Night* (1968), recorded, in great personal detail but in a third-person narration, his part in a citizens' protest march on Washington, D.C. It would seem that Mailer's talent lies in his ability to merge the art of fiction and the craft of reportage, and his *Of a Fire on the Moon* (1970), which deals with the American lunar project, reads like an episode in an emergent *roman-fleuve* of which Mailer is the central character.

The presentation of factual material as art is the purpose of such thinly disguised biographies as Somerset Maugham's *Moon and Sixpence* (1919), undisguised biographies fleshed out with supposition and imagination like Helen Waddell's *Peter Abelard* (1933), and many autobiographies served up—out of fear of libel or of dullness—as novels. Conversely, invented material may take on the lineaments of journalistic actuality through the employment of a Defoe technique of flat understatement. This is the way of such science fiction as Michael Crichton's *Andromeda Strain* (1969), which uses sketch maps, computer projections, and simulated typewritten reports.

Agent of change in language and thought. Novelists, being neither poets nor philosophers, rarely originate modes of thinking and expression. Poets such as Chaucer and Shakespeare have had much to do with the making of the English language, and Byron was responsible for the articulation of the new romantic sensibility in it in the early 19th century. Books like the Bible, Karl Marx's *Das Kapital,* and Adolf Hitler's *Mein Kampf* may underlie permanent or transient cultures, but it is hard to find, except in the early Romantic period, a novelist capable of arousing new attitudes to life (as opposed to aspects of the social order) and forging the vocabulary of such attitudes.

Sentiment

With the 18th-century precursors of Romanticism—notably Richardson, Sterne, and Rousseau—the notion of sentiment entered the European consciousness. Rousseau's *Nouvelle Héloïse* fired a new attitude toward love—more highly emotional than ever before—as his *Émile* (1762) changed educated views on how to bring up children. The romantic wave in Germany, with Goethe's *Sorrows of Young Werther* (1774) and the works of Jean-Paul Richter a generation later, similarly aroused modes of feeling that rejected the rational constraints of the 18th century. Nor can the influence of Sir Walter Scott's novels be neglected, both on Europe and on the American South (where Mark Twain thought it had had a deplorable effect). With Scott came new forms of regional sentiment, based on a romantic reading of history.

It is rarely, however, that a novelist makes a profound mark on a national language, as opposed to a regional dialect (to which, by using it for a literary end, he may impart a fresh dignity). It is conceivable that Alessandro Manzoni's *I promessi sposi* (1825–27; *The Betrothed*), often called the greatest modern Italian novel, gave 19th-century Italian intellectuals some notion of a viable modern prose style in an Italian that might be termed "national," but even this is a large claim. Günter Grass, in post-Hitler Germany, sought to revivify a language that had been corrupted by the Nazis; he threw whole dictionaries at his readers in the hope that new freedom, fantasy, and exactness in the use of words might influence the publicists, politicians, and teachers in the direction of a new liberalism of thought and expression.

It is difficult to say whether the French Existentialists, such as Sartre and Albert Camus, have influenced their age primarily through their fiction or their philosophical writings. Certainly, Sartre's early novel *Nausea* (1938) established unforgettable images of the key terms of his philosophy, which has haunted a whole generation, as Camus's novel *The Stranger* (1942) created for all time the lineaments of "Existential man." In the same way, the English writer George Orwell's *Nineteen Eighty-four* (1949) incarnated brilliantly the nature of the political choices that are open to 20th-century humanity, and, with terms like "Big Brother" (*i.e.*, the leader of an authoritarian state) and "doublethink" (belief in contradictory ideas simultaneously), modified the political vocabulary. But no novelist's influence can compare to that of the poet's, who can give a language a soul and define, as Shakespeare and Dante did, the scope of a culture.

Expression of the spirit of its age. The novelist, like the poet, can make the inchoate thoughts and feelings of a society come to articulation through the exact and imaginative use of language and symbol. In this sense, his work seems to precede the diffusion of new ideas and attitudes and to be the agent of change. But it is hard to draw a line between this function and that of expressing an existing climate of sensibility. Usually the nature of a historical period—that spirit known in German as the *Zeitgeist*—can be understood only in long retrospect, and it is then that the novelist can provide its best summation. The sickness of the Germany that produced Hitler had to wait some time for fictional diagnosis in such works as Thomas Mann's *Doctor Faustus* (1947) and, later, Günter Grass's *Tin Drum* (1959). Evelyn Waugh waited several years before beginning, in the trilogy *Sword of Honour*, to depict that moral decline of English society that started to manifest itself in World War II, the conduct of which was both a cause and a symptom of the decay of traditional notions of honour and justice.

The lag between events and their use in novels

The novel can certainly be used as a tool for the better understanding of a departed age. The period following World War I had been caught forever in Hemingway's *Sun Also Rises* (1926; called *Fiesta* in England), F. Scott Fitzgerald's novels and short stories about the so-called Jazz Age, the *Antic Hay* (1923) and *Point Counter Point* (1928) of Aldous Huxley, and D.H. Lawrence's *Aaron's Rod* (1922) and *Kangaroo* (1923). The spirit of the English 18th century, during which social, political, and religious ideas associated with rising middle classes conflicted with the old Anglican Tory rigidities, is better understood through reading Smollett and Fielding than by taking the cerebral elegance of Pope and his followers as the typical expression of the period.

Similarly, the unrest and bewilderment of the young in the period after World War II still speak in novels like J.D. Salinger's *Catcher in the Rye* (1951) and Kingsley Amis' *Lucky Jim* (1954). It is notable that with novels like these—and the beat-generation books of Jack Kerouac; the American-Jewish novels of Saul Bellow, Bernard Malamud, and Philip Roth; and the black novels of Ralph Ellison and James Baldwin—it is a segmented spirit that is expressed, the spirit of an age group, social group, or racial group, and not the spirit of an entire society in a particular phase of history. But probably a *Zeitgeist* has always been the emanation of a minority, the majority being generally silent. The 20th century seems, from this point of view, to be richer in vocal minorities than any other period in history.

Creator of life-style and arbiter of taste. Novels have been known to influence, though perhaps not very greatly, modes of social behaviour and even, among the very impressionable, conceptions of personal identity. But more young men have seen themselves as Hamlet or Childe Harold than as Julien Sorel, the protagonist of Stendhal's novel *The Red and the Black* (1830), or the sorrowing Werther. Richardson's novel may popularize Pamela, or Galsworthy's *Forsyte Saga* (1906–22) Jon, as a baptismal name, but it rarely makes a deeper impression on the mode of life of literate families. On the other hand, the capacity of Oscar Wilde's *Picture of Dorian Gray* (1891) to influence young men in the direction of sybaritic amorality, or of D.H. Lawrence's *Lady Chatterley's Lover* (1928) to engender a freer attitude to sex, has never been assessed adequately. With the lower middle class reading public, the effect of devouring *The Forsyte Saga* was to engender genteelisms—cucumber sandwiches for tea, supper renamed dinner—rather than to learn that book's sombre lesson about the decline of the old class structure. Similarly, the ladies who read Scott in the early 19th century were led to barbarous ornaments and tastefully arranged folk songs.

Fiction has to be translated into one of the dramatic media—stage, film, or television—before it can begin to exert a large influence. *Tom Jones* as a film in 1963 modified table manners and coiffures and gave American visitors to Great Britain a new (and probably false) set of expectations. The stoic heroes of Hemingway, given to drink, fights, boats, and monosyllables, became influential only when they were transferred to the screen. They engendered other, lesser heroes—incorruptible private detectives, partisans brave under interrogation—who in their turn have influenced the impressionable young when seeking an identity. Ian Fleming's James Bond led to a small revolution in martini ordering. But all these influences are a matter of minor poses, and such poses are most readily available in fiction easily adapted to the mass media—which means lesser fiction. Proust, though he recorded French patrician society with painful fidelity, had little influence on it, and it is hard to think of Henry James disturbing the universe even fractionally. Films and television programs dictate taste and behaviour more than the novel ever could.

Fiction in other media

STYLE

Romanticism. The Romantic movement in European literature is usually associated with those social and philosophical trends that prepared the way for the French Revolution, which began in 1789. The somewhat subjective, anti-rational, emotional currents of romanticism transformed intellectual life in the revolutionary and Napoleonic periods and remained potent for a great part of the 19th century. In the novel, the romantic approach to life was prepared in the "sentimental" works of Richardson and Sterne and attained its first major fulfillment in the novels of Rousseau. Sir Walter Scott, in his historical novels, turned the past into a great stage for the enactment of events motivated by idealism, chivalry, and strong emotional impulse, using an artificially archaic language full of remote and magical charm. The exceptional soul—poet, patriot, idealist, madman—took the place of dully reasonable fictional heroes, such as Tom Jones, and sumptuous and mysterious settings ousted the plain town and countryside of 18th-century novels.

The romantic novel must be seen primarily as a historical phenomenon, but the romantic style and spirit, once they had been brought into being, remained powerful and attractive enough to sustain a whole subspecies of fiction. The cheapest love story can be traced back to the example of Charlotte Brontë's *Jane Eyre* (1847), or even Rousseau's earlier *Nouvelle Héloïse*. Similarly, best-selling historical novels, even those devoid of literary merit, can find their progenitor in Scott, and science fiction in Mary Shelley's *Frankenstein* (1818), a romantic novel subtitled *The Modern Prometheus*, as well as in Jules Verne and H.G. Wells. The aim of romantic fiction is less to present a true picture of life than to arouse the emotions through a depiction of strong passions, or to fire the imagination with exotic, terrifying, or wonderful scenes and events. When it is condemned by critics, it is because it seems to falsify both life and language; the pseudopoetical enters the dialogue and *récit* alike, and humanity is seen in only one of its aspects—that of feeling untempered with reason.

If such early romantic works as those of Scott and of the Goethe of *The Sorrows of Werther* have long lost their original impact, the romantic spirit still registers power and truth in the works of the Brontës—particularly in Emily Brontë's *Wuthering Heights*, in which the poetry is genuine and the strange instinctual world totally convincing. Twentieth-century romantic fiction records few masterpieces. Writers like Daphne du Maurier, the author of *Jamaica Inn* (1936), *Rebecca* (1938), and many others,

Decline of the romantic novel

are dismissed as mere purveyors of easy dreams. It is no more possible in the 20th century to revive the original romantic élan in literature than it is to compose music in the style of Beethoven. Despite the attempts of Lawrence Durrell to achieve a kind of decadent romantic spirit in his *Alexandria Quartet*, the strong erotic feeling, the exotic setting, the atmosphere of poetic hallucination, the pain, perversion, and elemental force seem to be contrivances, however well they fulfill the original romantic prescription.

Realism. Certain major novelists of the 19th century, particularly in France, reacted against romanticism by eliminating from their work those "softer" qualities—tenderness, idealism, chivalric passion, and the like—which seemed to them to hide the stark realities of life in a dreamlike haze. In Gustave Flaubert's works there are such romantic properties—his novel *Salammbô* (1862), for instance, is a sumptuous representation of a remote pagan past—but they are there only to be punctured with realistic irony. On one level, his *Madame Bovary* may be taken as a kind of parable of the punishment that fate metes out to the romantic dreamer, and it is the more telling because Flaubert recognized a strong romantic vein in himself: "Madame Bovary, c'est moi" ("Madame Bovary is myself"). Stendhal and Balzac, on the other hand, admit no dreams and present life in a grim nakedness without poetic drapery.

Balzac's mammoth fictional work—the 20-year succession of novels and stories he published under the collective title *La Comédie humaine* (*The Human Comedy*)—and Stendhal's novels of the same period, *The Red and the Black* (1830) and *The Charterhouse of Parma* (1839), spare the reader nothing of those baser instincts in man and society that militate against, and eventually conquer, many human aspirations. Rejecting romanticism so energetically, however, they swing to an extreme that makes "realism" a synonym for unrelenting pessimism. Little comes right for the just or the weak, and base human nature is unqualified by even a modicum of good. But there is a kind of affirmative richness and energy about both writers that seems to belie their pessimistic thesis.

The pessimistic view

In England, George Eliot in her novel *Middlemarch* (1871–72) viewed human life grimly, with close attention to the squalor and penury of rural life. If "nature" in works by romantic poets like Wordsworth connoted a kind of divine benevolence, only the "red in tooth and claw" aspect was permitted to be seen in the novels of the realists. George Eliot does not accept any notion of Divine Providence, whether Christian or pantheistic, but her work is instinct with a powerful moral concern: her characters never sink into a deterministic morass of hopelessness, since they have free will, or the illusion of it. With Thomas Hardy, who may be termed the last of the great 19th-century novelists, the determinism is all-pervasive, and his final novel, *Jude the Obscure* (1896), represents the limit of pessimism. Behind him one is aware of the new science, initiated by the biologists Charles Darwin and T.H. Huxley, which displaces man as a free being, capable of choice, by a view of him as the product of blind mechanistic forces over which he has little control.

Realism in this sense has been a continuing impulse in the 20th-century novel, but few writers would go so far as Hardy in positing man's near-total impotence in a hostile universe, with the gods killing human creatures for their sport. Realism in the Existentialist fiction of 20th-century France, for instance, makes man not merely wretched but absurd, yet it does not diminish his power of self-realization through choice and action. Realism has frequently been put in the service of a reforming design, which implies a qualified optimism. War novels, novels about the sufferings of the oppressed (in prison, ghetto, totalitarian state), studies of human degradation that are bitter cries against man-made systems—in all of these the realistic approach is unavoidable, and realistic detail goes much further than anything in the first realists. But there is a difference in the quality of the anger the reader feels when reading the end of Hardy's *Tess of the D'Urbervilles* (1891) and that generated by Upton Sinclair's *Jungle* (1906) or Erich Maria Remarque's *All Quiet on the Western Front* (1929). In Hardy's novel, pessimistic determinism, reducing human character to pain, frustration, and impotent anger, was—paradoxically—appropriate to an age that knew no major cataclysms or oppressions. The novels of Sinclair and Remarque reflect the 20th century, which saw the origin of all wrong in the human will, and set on a program of diagnosis and reform.

Realism as reform

Naturalism. The naturalistic novel is a development out of realism, and it is, again, in France that its first practitioners are to be found, with Émile Zola leading. It is difficult to separate the two categories, but naturalism seems characterized not only by a pessimistic determinism but also by a more thoroughgoing attention to the physical and biological aspects of human existence. Man is less a soul aspiring upward to its divine source than a product of natural forces, as well as genetic and social influences, and the novelist's task is to present the physical essence of man and his environment. The taste of Balzac's and Stendhal's audiences was not easily able to accommodate itself to utter frankness about the basic processes of life, and the naturalists had to struggle against prejudice, and often censorship, before their literary candour was able to prevail. The 20th century takes the naturalistic approach for granted, but it is more concerned with a technique of presentation than with the somewhat mechanistic philosophy of Zola and his followers.

Naturalism received an impetus after World War I, when novelists felt they had a duty to depict the filth, suffering, and degradation of the soldier's life, without euphemism or circumlocution. Joyce's *Ulysses*, when it appeared in 1922, was the first novel to seek to justify total physical candour in terms of its artistic, as opposed to moral, aim—which was to depict with almost scientific objectivity every aspect of an ordinary urban day. Though Joyce had read Zola, he seems to invoke the spirit of a very much earlier naturalistic writer—the ribald French author of the 16th century, François Rabelais—and this is in keeping with the Catholic tradition that Joyce represents. Zola, of course, was an atheist.

It would have been a sin against his aesthetic canons for Joyce to have shown Leopold Bloom—the protagonist of *Ulysses*—eating breakfast or taking a bath and yet not defecating or masturbating. The technique of the interior monologue, which presented the unedited flow of a character's unspoken thought and emotion, also called for the utmost frankness in dealing with natural functions and urges. Joyce, it is now recognized, had no prurient or scatological intention; his concern was with showing life as it is (without any of the didactic purpose of Zola), and this entailed the presentation of lust, perversion, and blasphemy as much as any of the traditionally acceptable human functions.

The naturalistic novelists have had their social and legal problems—obscenity indictments, confiscation, emasculation by timid publishers—but the cause was ultimately won, at least in Great Britain and the United States, where there are few limits placed on the contemporary novelist's proclaimed right to be true to nature. In comparison with much contemporary fiction the pioneer work of Zola seems positively reticent.

Impressionism. The desire to present life with frank objectivity led certain early 20th-century novelists to question the validity of long-accepted narrative conventions. If truth was the novelist's aim, then the tradition of the omniscient narrator would have to go, to be replaced by one in which a fallible, partially ignorant character—one involved in the story and hence himself subject to the objective or naturalistic approach—recounted what he saw and heard. But the Impressionist painters of late 19th-century France had proclaimed a revision of the whole seeing process: they distinguished between what the observer assumed he was observing and what he actually observed. That cerebral editing which turned visual data into objects of geometric solidity had no place in Impressionist painting; the visible world became less definite, more fluid, resolving into light and colour.

The influence of the painters

The German novelists Thomas Mann and Hermann Hesse, moving from the realist tradition, which concentrated on closely notated detail in the exterior world, sought the lightness and clarity of a more elliptical style, and were

proclaimed Impressionists. But in England Ford Madox Ford went much further in breaking down the imagined rigidities of the space–time continuum, liquidating step-by-step temporal progression and making the visual world shimmer, dissolve, reconstitute itself. In Ford's tetralogy *Parade's End* (1924–28), the reader moves freely within the time continuum, as if it were spatial, and the total picture is perceived through an accumulation of fragmentary impressions. Ford's masterpiece, *The Good Soldier*, pushes the technique to its limit: the narrator tells his story with no special dispensation to see or understand more than a fallible being can, and, in his reminiscences, he fragments whole sequences of events as he ranges freely through time (such freedom had traditionally been regarded as a weakness, a symptom of the disease of inattention).

In the approach to dialogue manifested in a book that Ford wrote jointly with Conrad—*The Inheritors* (1901)—a particular aspect of literary impressionism may be seen whose suggestiveness has been ignored by other modern novelists. As the brain imposes its own logical patterns on the phenomena of the visual world, so it is given to editing into clarity and conciseness the halting utterances of real-life speech; the characters of most novels are impossibly articulate. Ford and Conrad attempted to present speech as it is actually spoken, with many of the meaningful solidities implied rather than stated. The result is sometimes exasperating, but only as real-life conversation frequently is.

The interior monologue, which similarly resists editing, may be regarded as a development of this technique. To show pre-articulatory thought, feeling, and sensuous perception unordered into a rational or "literary" sequence is an impressionistic device that, beginning in Édouard Dujardin's minor novel *Les Lauriers sont coupés* (1888; *We'll to the Woods No More*), served fiction of high importance, from Dorothy Richardson, Joyce, and Virginia Woolf to William Faulkner and Samuel Beckett.

Novelists like Ronald Firbank and Evelyn Waugh (who studied painting and was a competent draftsman) learned, in a more general sense, how to follow the examples of the Impressionist and Postimpressionist painters in their fiction. A spare brilliance of observation, like those paintings in which a whole scene is suggested through carefully selected points of colour, replaced that careful delineation of a whole face, or inventorying of a whole room, that had been the way of Balzac and other realists. In four or five brief lines of dialogue Waugh can convey as much as the 19th-century novelists did in as many pages.

Expressionism. Expressionism was a German movement that found its most congenial media in painting and drama. The artist's aim was to express, or convey the essence of, a particular theme, to the exclusion of such secondary considerations as fidelity to real life. The typical Expressionist play, by Bertolt Brecht, for example, concerns itself with a social or political idea that is hurled at the audience through every possible stage device—symbols, music, cinematic insertions, choral speech, dance. Human character is less important than the idea of humanity, and probability of action in the old realist sense is the least of the dramatist's concerns. The emotional atmosphere is high-pitched, even ecstatic, and the tone is more appropriate to propaganda than to art. Expressionistic technique, as the plays of Brecht prove, was an admirable means of conveying a Communist program, and it was in the service of such a program that John Dos Passos, in the trilogy of novels *U.S.A.* (1937), used literary devices analogous to the dramatic ones of Brecht—headlines, tabloid biographies, popular songs, lyric soliloquies, and the like.

Expressionism as alienation

But the Austro-Czech Franz Kafka, the greatest of the Expressionist novelists, sought to convey what may crudely be termed man's alienation from his world in terms that admit of no political interpretation. Joseph K., the hero of Kafka's novel *The Trial* (1925), is accused of a nameless crime, he seeks to arm himself with the apparatus of a defense, and he is finally executed—stabbed with the utmost courtesy by two men in a lonely place. The hallucinatory atmosphere of that novel, as also of his novel *The Castle* (1926), is appropriate to nightmare, and indeed Kafka's work has been taken by many as an imaginative forecast of the nightmare through which Europe was compelled to live during the Hitler regime. But its significance is more subtle and universal; one of the elements is original sin and another filial guilt. In the story *The Metamorphosis* (1915) a young man changes into an enormous insect, and the nightmare of alienation can go no further.

Kafka's influence has been considerable. Perhaps his most distinguished follower is the English writer Rex Warner, whose *Wild Goose Chase* (1937) and *Aerodrome* (1941) use fantasy, symbol, and improbable action for an end that is both Marxist and Freudian; the filial guilt, however, seems to be taken directly from Kafka, with an innocent hero caught in a monstrously oppressive web that is both the totalitarian state and paternal tyranny. More recently, the American writer William Burroughs has developed his own Expressionistic techniques in *The Naked Lunch* (1959), which is concerned with the alienation from society of the drug addict. His later novels *Nova Express* (1964) and *The Ticket That Exploded* (1962) use obscene fantasy to present a kind of metaphysical struggle between free spirit and enslaved flesh, evidently an extrapolation of the earlier drug theme. Burroughs is a didactic novelist, and didacticism functions best in a fictional ambience that rejects the complexities of character and real-life action.

Avant-gardism. Many innovations in fiction can be classified under headings already considered. Even so revolutionary a work as Joyce's *Finnegans Wake* represents an attempt to show the true nature of a dream; this can be regarded as a kind of Impressionism pushed so far that it looks like Surrealism. The brief novels of Samuel Beckett (which, as they aim to demonstrate the inadequacy of language to express the human condition, become progressively more brief) seem to have a kind of Expressionist derivation, since everything in them is subordinated to a central image of man as a totally deprived creature, resentful of a God he does not believe in. The French anti-novel, dethroning man as a primary concern of fiction, perhaps represents the only true break with traditional technique that the 20th-century novel has seen.

Technical innovation

Dissatisfaction not only with the content of the traditional novel but with the manner in which readers have been schooled to approach it has led the contemporary French novelist Michel Butor, in *Mobile*, to present his material in the form of a small encyclopaedia, so that the reader finds his directions obliquely, through an alphabetic taxonomy and not through the logic of sequential events. Nabokov, in *Pale Fire* (1962), gives the reader a poem of 999 lines and critical apparatus assembled by a madman; again the old sense of direction (beginning at the beginning and going on to the end) has been liquidated, yet *Pale Fire* is a true and highly intelligible novel. In England, B.S. Johnson published similar "false-directional" novels, though the influence of Sterne makes them seem accessible, even cozily traditional. One of Johnson's books is marketed as a bundle of disjunct chapters—which may thus be dealt aleatorially and read in any order.

Available avant-garde techniques are innumerable, though not all of them are salable. There is the device of counterpointing a main narrative with a story in footnotes, which eventually rises like water and floods the other. A novel has been written, though not published, in which the words are set (rather like the mouse's tail or tale in *Alice in Wonderland*) to represent graphically the physical objects in the narrative. Burroughs has experimented with a tricolumnar technique, in which three parallel narratives demand the reader's attention. But the writers like Borges and Nabokov go beyond mere technical innovation: they ask for a reconsideration of the very essence of fiction. In one of his *ficciones*, Borges strips from the reader even the final illusion that he is reading a story, for the story is made to dissolve, the artist evidently losing faith in his own artifact. Novels, as both Borges and Nabokov show, can turn into poems or philosophical essays, but they cannot, while remaining literature, turn into compositions disclaiming all interest in the world of feeling, thought, and sense. The novelist can do anything he pleases with his art so long as he interprets, or even just presents, a world that the reader recognizes as existing, or capable of existing, or capable of being dreamed of as existing.

TYPES OF NOVEL

Historical. For the hack novelist, to whom speedy output is more important than art, thought, and originality, history provides ready-made plots and characters. A novel on Alexander the Great or Joan of Arc can be as flimsy and superficial as any schoolgirl romance. But historical themes, to which may be added prehistoric or mythical ones, have inspired the greatest novelists, as Tolstoy's *War and Peace* and Stendhal's *Charterhouse of Parma* reveal. In the 20th century, distinguished historical novels such as Arthur Koestler's *The Gladiators* (1939), Robert Graves's *I, Claudius* (1934), Zoé Oldenbourg's *Destiny of Fire* (1960), and Mary Renault's *The King Must Die* (1958) exemplify an important function of the fictional imagination—to interpret remote events in human and particular terms, to transform documentary fact, with the assistance of imaginative conjecture, into immediate sensuous and emotional experience.

There is a kind of historical novel, little more than a charade, which frequently has a popular appeal because of a common belief that the past is richer, bloodier, and more erotic than the present. Such novels, which include such immensely popular works as those of Georgette Heyer, or Baroness Orczy's Scarlet Pimpernel stories in England in the early 20th century, and *Forever Amber* (1944) by Kathleen Winsor in the United States, may use the trappings of history but, because there is no real assimilation of the past into the imagination, the result must be a mere costume ball. On the other hand, the American novelist John Barth showed in *The Sot-Weed Factor* (1960) that mock historical scholarship—preposterous events served up with parodic pomposity—could constitute a viable, and not necessarily farcical, approach to the past. Barth's history is cheerfully suspect, but his sense of historical perspective is genuine.

It is in the technical conservatism of most European historical novels that the serious student of fiction finds cause to relegate the category to a secondary place. Few practitioners of the form seem prepared to learn from any writer later than Scott, though Virginia Woolf—in *Orlando* (1928) and *Between the Acts* (1941)—made bold attempts to squeeze vast tracts of historical time into a small space and thus make them as fictionally manageable as the events of a single day. And John Dos Passos' *U.S.A.,* which can be taken as a historical study of a phase in America's development, is a reminder that experiment is not incompatible with the sweep and amplitude that great historical themes can bring to the novel.

Picaresque. In Spain, the novel about the rogue or *pícaro* was a recognized form, and such English novels as Defoe's *The Fortunate Mistress* (1724) can be regarded as picaresque in the etymological sense. But the term has come to connote as much the episodic nature of the original species as the dynamic of roguery. Fielding's *Tom Jones,* whose hero is a bastard, amoral, and very nearly gallows-meat, has been called picaresque, and the *Pickwick Papers* of Dickens—whose eponym is a respectable and even childishly ingenuous scholar—can be accommodated in the category.

The requirements for a picaresque novel are apparently length, loosely linked episodes almost complete in themselves, intrigue, fights, amorous adventure, and such optional items as stories within the main narrative, songs, poems, or moral homilies. Perhaps inevitably, with such a structure or lack of it, the driving force must come from a wild or roguish rejection of the settled bourgeois life, a desire for the open road, with adventures in inn bedrooms and meetings with questionable wanderers. In the modern period, Saul Bellow's *Adventures of Augie March* (1953) and Jack Kerouac's *Dharma Bums* (1959) have something of the right episodic, wandering, free, questing character. But in an age that lacks the unquestioning acceptance of traditional morality against which the old picaresque heroes played out their villainous lives, it is not easy to revive the *novela picaresca* as the anonymous author of *Lazarillo de Tormes* (1554) conceived it, or as such lesser Spanish writers of the beginning of the 17th century as Mateo Alemán, Vicente Espinel, and Luis Vélez de Guevara developed it. The modern criminal wars with the police rather than with society, and his career is one of closed and narrow techniques, not compatible with the gay abandon of the true *pícaro.*

Sentimental. The term sentimental, in its mid-18th-century usage, signified refined or elevated feeling, and it is in this sense that it must be understood in Laurence Sterne's *Sentimental Journey* (1768). Richardson's *Pamela* (1740) and Rousseau's *Nouvelle Héloïse* (1761) are sentimental in that they exhibit a passionate attachment between the sexes that rises above the merely physical. The vogue of the sentimental love novel was one of the features of the Romantic movement, and the form maintained a certain moving dignity despite a tendency to excessive emotional posturing. The germs of mawkishness are clearly present in Sterne's *Tristram Shandy* (1760–67), though offset by a diluted Rabelaisianism and a certain cerebral quality. The debasement by which the term sentimental came to denote a self-indulgence in superficial emotions occurred in the Victorian era, under the influence of sanctimony, religiosity, and a large commercial demand for bourgeois fiction. Sentimental novels of the 19th and 20th centuries are characterized by an invertebrate emotionalism and a deliberately lachrymal appeal. Neither Dickens nor Thackeray was immune to the temptations of sentimentality—as is instanced by their treatment of deathbed scenes. The reported death of Tiny Tim in *A Christmas Carol* (1843) is an example of Dickens' ability to provoke two tearful responses from the one situation—one of sorrow at a young death, the other of relief at the discovery that the death never occurred. Despite such patches of emotional excess, Dickens cannot really be termed a sentimental novelist. Such a designation must be reserved for writers like Mrs. Henry Wood, the author of *East Lynne* (1861). That the sentimental novel is capable of appeal even in the Atomic Age is shown by the success of *Love Story* (1970), by Erich Segal. That this is the work of a Yale professor of classics seems to indicate either that not even intellectuals disdain sentimental appeal or that tearjerking is a process to be indulged in coldly and even cynically. Stock emotions are always easily aroused through stock devices, but both the aim and the technique are generally eschewed by serious writers.

Gothic. The first Gothic fiction appeared with works like Horace Walpole's *Castle of Otranto* (1765) and Matthew Gregory Lewis' *Monk* (1796), which countered 18th-century "rationalism" with scenes of mystery, horror, and wonder. Gothic (the spelling "Gothick" better conveys the contemporary flavour) was a designation derived from architecture, and it carried—in opposition to the Italianate style of neoclassical building more appropriate to the Augustan Age—connotations of rough and primitive grandeur. The atmosphere of a Gothic novel was expected to be dark, tempestuous, ghostly, full of madness, outrage, superstition, and the spirit of revenge. Mary Shelley's *Frankenstein,* which maintains its original popularity and even notoriety, has in overplus the traditional Gothic ingredients, with its weird God-defying experiments, its eldritch shrieks, and, above all, its monster. Edgar Allan Poe developed the Gothic style brilliantly in the United States, and he has been a considerable influence. A good deal of early science fiction, like H.G. Wells's *Island of Doctor Moreau* (1896), seems to spring out of the Gothic movement, and the Gothic atmosphere has been seriously cultivated in England in the later novels of Iris Murdoch and in the Gormenghast sequence beginning in 1946 of Mervyn Peake. It is noteworthy that Gothic fiction has always been approached in a spirit of deliberate suspension of the normal canons of taste. Like a circus trick, a piece of Gothic fiction asks to be considered as ingenious entertainment; the pity and terror are not aspects of a cathartic process but transient emotions to be, somewhat perversely, enjoyed for their own sake.

Ingredients of the typical Gothic novel

Psychological. The psychological novel first appeared in 17th-century France, with Madame de La Fayette's *Princesse de Clèves* (1678), and the category was consolidated by works like the Abbé Prévost's *Manon Lescaut* (1731) in the century following. More primitive fiction had been characterized by a proliferation of action and incidental characters; the psychological novel limited it-

self to a few characters whose motives for action could be examined and analyzed. In England, the psychological novel did not appear until the Victorian era, when George Eliot became its first great exponent. It has been assumed since then that the serious novelist's prime concern is the workings of the human mind, and hence much of the greatest fiction must be termed psychological. Dostoyevsky's *Crime and Punishment* deals less with the ethical significance of a murder than with the soul of the murderer; Flaubert's interest in Emma Bovary has less to do with the consequences of her mode of life in terms of nemesic logic than with the patterns of her mind; in *Anna Karenina,* Tolstoy presents a large-scale obsessive study of feminine psychology that is almost excruciating in its relentless probing. The novels of Henry James are psychological in that the crucial events occur in the souls of the protagonists, and it was perhaps James more than any serious novelist before or since who convinced frivolous novel-readers that the "psychological approach" guarantees a lack of action and excitement.

The theories of Sigmund Freud are credited as the source of the psychoanalytical novel. Freud was anticipated, however, by Shakespeare (in, for example, his treatment of Lady Macbeth's somnambulistic guilt). Two 20th-century novelists of great psychological insight—Joyce and Nabokov—professed a disdain for Freud. To write a novel with close attention to the Freudian or Jungian techniques of analysis does not necessarily produce new prodigies of psychological revelation; Oedipus and Electra complexes have become commonplaces of superficial novels and films. The great disclosures about human motivation have been achieved more by the intuition and introspection of novelists and dramatists than by the more systematic work of the clinicians.

The movement away from Freud

The novel of manners. To make fiction out of the observation of social behaviour is sometimes regarded as less worthy than to produce novels that excavate the human mind. And yet the social gestures known as manners, however superficial they appear to be, are indices of a collective soul and merit the close attention of the novelist and reader alike. The works of Jane Austen concern themselves almost exclusively with the social surface of a fairly narrow world, and yet she has never been accused of a lack of profundity. A society in which behaviour is codified, language restricted to impersonal formulas, and the expression of feeling muted, is the province of the novel of manners, and such fiction may be produced as readily in the 20th century as in the era of Fanny Burney or Jane Austen. Such novels as Evelyn Waugh's *Handful of Dust* (1934) depend on the exact notation of the manners of a closed society, and personal tragedies are a mere temporary disturbance of collective order. Even Waugh's trilogy *Sword of Honour* is as much concerned with the minutiae of surface behaviour in an army, a very closed society, as with the causes for which that army fights. H.H. Munro ("Saki"), in *The Unbearable Bassington* (1912), an exquisite novel of manners, says more of the nature of Edwardian society than many a more earnest work. It is conceivable that one of the novelist's duties to posterity is to inform it of the surface quality of the society that produced him; the great psychological profundities are eternal, manners are ephemeral and have to be caught. Finally, the novel of manners may be taken as an artistic symbol of a social order that feels itself to be secure.

Epistolary. The novels of Samuel Richardson arose out of his pedagogic vocation, which arose out of his trade of printer—the compilation of manuals of letter-writing technique for young ladies. His age regarded letter writing as an art on which could be expended the literary care appropriate to the essay or to fiction, and, for Richardson, the creation of epistolary novels entailed a mere step from the actual world into that of the imagination. His *Pamela* (1740) and *Clarissa* (1748) won phenomenal success and were imitated all over Europe, and the epistolary novel—with its free outpouring of the heart—was an aspect of early romanticism. In the 19th century, when the letter-writing art had not yet fallen into desuetude, it was possible for Wilkie Collins to tell the mystery story of *The Moonstone* (1868) in the form of an exchange of letters, but it would be hard to conceive of a detective novel using such a device in the 20th century, when the well-wrought letter is considered artificial. Attempts to revive the form have not been successful, and Christopher Isherwood's *Meeting by the River* (1967), which has a profoundly serious theme of religious conversion, seems to fail because of the excessive informality and chattiness of the letters in which the story is told. The 20th century's substitute for the long letter is the transcribed tape recording—more, as Beckett's play *Krapp's Last Tape* indicates, a device for expressing alienation than a tool of dialectic. But it shares with the Richardsonian epistle the power of seeming to grant direct communication with a fictional character, with no apparent intervention on the part of the true author.

Pastoral. Fiction that presents rural life as an idyllic condition, with exquisitely clean shepherdesses and sheep immune to foot-rot, is of very ancient descent. Longus' *Daphnis and Chloe,* written in Greek in the 2nd or 3rd century AD, was the remote progenitor of such Elizabethan pastoral romances as Sir Philip Sidney's *Arcadia* (1590) and Thomas Lodge's *Rosalynde* (1590), the source book for Shakespeare's *As You Like It.* The *Paul et Virginie* of Bernardin de St. Pierre (1787), which was immensely popular in its day, seems to spring less from the pastoral utopian convention than from the dawning Romanticism that saw in a state of nature only goodness and innocence. Still, the image of a rural Eden is a persistent one in Western culture, whatever the philosophy behind it, and there are elements of this vision even in D.H. Lawrence's *Rainbow* (1915) and, however improbable this may seem, in his *Lady Chatterley's Lover* (1928). The more realistic and ironic pictures of the pastoral life, with poverty and pig dung, beginning with George Crabbe's late-18th-century narrative poems, continuing in George Eliot, reaching sour fruition in Thomas Hardy, are usually the work of people who know the country well, while the rural idyll is properly a townsman's dream. The increasing stresses of urban life make the country vision a theme still available to serious fiction, as even a work as sophisticated as Saul Bellow's *Herzog* (1964) seems to show. But, since Stella Gibbons' satire *Cold Comfort Farm* (1932), it has been difficult for any British novelist to take seriously pastoral lyricism.

Realism in the pastoral novel

Apprenticeship. The *Bildungsroman,* or novel about upbringing and education, seems to have its beginnings in Goethe's work, *Wilhelm Meisters Lehrjahre* (1796), which is about the processes by which a sensitive soul discovers its identity and its role in the big world. A story of the emergence of a personality and a talent, with its implicit motifs of struggle, conflict, suffering, and success, has an inevitable appeal for the novelist; many first novels are autobiographical and attempt to generalize the author's own adolescent experiences into a kind of universal symbol of the growing and learning processes. Charles Dickens embodies a whole *Bildungsroman* in works like *David Copperfield* (1850) and *Great Expectations* (1861), but allows the emerged ego of the hero to be absorbed into the adult world, so that he is the character that is least remembered. H.G. Wells, influenced by Dickens but vitally concerned with education because of his commitment to socialist or utopian programs, looks at the agonies of the growing process from the viewpoint of an achieved utopia in *The Dream* (1924) and, in *Joan and Peter* (1918), concentrates on the search for the right modes of apprenticeship to the complexities of modern life.

The school story established itself in England as a form capable of popularization in children's magazines, chiefly because of the glamour of elite systems of education as first shown in Thomas Hughes's *Tom Brown's School Days* (1857), which is set at Rugby. In France, *Le Grand Meaulnes* (1913) of Alain-Fournier is the great exemplar of the school novel. The studies of struggling youth presented by Hermann Hesse became, after his death in 1962, part of an American campus cult indicating the desire of the serious young to find literary symbols for their own growing problems.

Samuel Butler's *Way of All Flesh,* which was written by 1885 but not published until 1903, remains one of the

greatest examples of the modern *Bildungsroman;* philosophical and polemic as well as moving and comic, it presents the struggle of a growing soul to further, all unconsciously, the aims of evolution, and is a devastating indictment of Victorian paternal tyranny. But probably James Joyce's *Portrait of the Artist as a Young Man* (1916), which portrays the struggle of the nascent artistic temperament to overcome the repressions of family, state, and church, is the unsurpassable model of the form in the 20th century. That the learning novel may go beyond what is narrowly regarded as education is shown in two remarkable works of the 1950s—William Golding's *Lord of the Flies* (1955), which deals with the discovery of evil by a group of shipwrecked middle class boys brought up in the liberal tradition, and J.D. Salinger's *Catcher in the Rye* (1951), which concerns the attempts of an adolescent American to come to terms with the adult world in a series of brief encounters, ending with his failure and his ensuing mental illness.

Roman à clef. Real, as opposed to imaginary, human life provides so much ready-made material for the novelist that it is not surprising to find in many novels a mere thinly disguised and minimally reorganized representation of actuality. When, for the fullest appreciation of a work of fiction, it is necessary for the reader to consult the real-life personages and events that inspired it, then the work is a *roman à clef,* or novel that needs a key. In a general sense, every work of literary art requires a key or clue to the artist's preoccupations (the jail in Dickens; the mysterious tyrants in Kafka, both leading back to the author's own father), but the true *roman à clef* is more particular in its disguised references. Chaucer's "Nun's Priest's Tale" has puzzling naturalistic details that can be cleared up only by referring the poem to an assassination plot in which the Earl of Bolingbroke was involved. Swift's *Tale of a Tub* (1704), Dryden's *Absalom and Achitophel* (1681), and Orwell's *Animal Farm* (1945) make total sense only when their hidden historical content is disclosed. These, of course, are not true novels, but they serve to indicate a literary purpose that is not primarily aesthetic. Lawrence's *Aaron's Rod* requires a knowledge of the author's personal enmities, and to understand Aldous Huxley's *Point Counter Point* fully one must know, for instance, that the character of Mark Rampion is D.H. Lawrence himself and that of Denis Burlap is the critic John Middleton Murry. Proust's *À la recherche du temps perdu* becomes a richer literary experience when the author's social milieu is explored, and Joyce's *Finnegans Wake* has so many personal references that it may be called the most massive *roman à clef* ever written. The more important the *clef* becomes to full understanding, the closer the work has come to a special kind of didacticism. When it is dangerous to expose the truth directly, then the novel or narrative poem may present it obliquely. But the ultimate vitality of the work will depend on those elements in it that require no key.

Anti-novel. The movement away from the traditional novel form in France in the form of the *nouveau roman* tends to an ideal that may be called the anti-novel—a work of the fictional imagination that ignores such properties as plot, dialogue, human interest. It is impossible, however, for a human creator to create a work of art that is completely inhuman. Contemporary French writers like Alain Robbe-Grillet in *Jealousy* (1957), Nathalie Sarraute in *Tropisms* (1939) and *The Planetarium* (1959), and Michel Butor in *Passing Time* (1957) and *Degrees* (1960) wish mainly to remove the pathetic fallacy from fiction, in which the universe, which is indifferent to man, is made to throw back radar reflections of man's own emotions. Individual character is not important, and consciousness dissolves into sheer "perception." Even time is reversible, since perceptions have nothing to do with chronology, and, as Butor's *Passing Time* shows, memories can be lived backward in this sort of novel. Ultimately, the very appearance of the novel—traditionally a model of the temporal treadmill—must change; it will not be obligatory to start at page 1 and work through to the end; a novel can be entered at any point, like an encyclopaedia.

The two terms most heard in connection with the French anti-novel are *chosisme* and *tropisme.* The first, with which Robbe-Grillet is chiefly associated, relates to the novelist's concern with things in themselves, not things as human symbols or metaphors. The second, which provided a title for Nathalie Sarraute's early novel, denotes the response of the human mind to external stimuli—a response that is general and unmodified by the apparatus of "character." It is things, the furniture of the universe, that are particular and variable; the multiplicity of human observers melts into an undifferentiable mode of response. Needless to say, there is nothing new in this epistemology as applied to the novel. It is present in Laurence Sterne (in whom French novelists have always been interested), as also in Virginia Woolf.

Chosisme and tropisme

Such British practitioners of the anti-novel as Christine Brooke-Rose and Rayner Heppenstall (both French scholars, incidentally) are more empirical than their French counterparts. They object mainly to the falsification of the external world that was imposed on the traditional novel by the exigencies of plot and character, and they insist on notating the minutiae of the surface of life, concentrating in an unhurried fashion on every detail of its texture. A work like Heppenstall's *Connecting Door* (1962), in which the narrator-hero does not even possess a name, is totally unconcerned with action but very interested in buildings, streets, and the sound of music. This is properly a fresh approach to the materials of the traditional novel rather than a total liberation from it. Such innovations as are found in the *nouveau roman* can best show their value in their influence on traditional novelists, who may be persuaded to observe more closely and be wary of the seductions of swift action, contrived relationships, and neat resolutions.

Cult, or coterie, novels. The novel, unlike the poem, is a commercial commodity, and it lends itself less than the materials of literary magazines to that specialized appeal called coterie, intellectual or elitist. It sometimes happens that books directed at highly cultivated audiences—like *Ulysses, Finnegans Wake,* and Djuna Barnes's *Nightwood* (1936)—achieve a wider response, sometimes because of their daring in the exploitation of sex or obscenity, more often because of a vitality shared with more demotic fiction. The duplicated typescript or the subsidized periodical, rather than the commercially produced book, is the communication medium for the truly hermetic novel.

The novel that achieves commercial publication but whose limited appeal precludes large financial success can frequently become the object of cult adulation. In the period since World War II, especially in the United States, such cults can have large memberships. The cultists are usually students (who, in an era of mass education, form a sizable percentage of the total population of the United States), or fringes of youth sharing the student ethos, and the novels chosen for cult devotion relate to the social or philosophical needs of the readers. The fairy stories of Tolkien, *The Lord of the Flies* of Golding, the science fiction of Kurt Vonnegut, Jr., have, for a greater or lesser time, satisfied a hunger for myth, symbols, and heterodox ideas, to be replaced with surprising speed by other books. The George Orwell cult among the young was followed by a bitter reaction against Orwell's own alleged reactionary tendencies, and such a violent cycle of adoration and detestation is typical of literary cults. Adult cultists tend, like young ones, to be centred in universities, from which they circulate newsletters on *Finnegans Wake,* Anthony Powell's *Music of Time* sequence, and the works of Evelyn Waugh. Occasionally new public attention becomes focussed on a neglected author through his being chosen as a cult object. This happened when the novellas of Ronald Firbank, the anonymous comic novel *Augustus Carp, Esq.,* and G.V. Desani's *All About Mr. Hatterr* got back into print because of the urging of minority devotees. Despite attempts to woo a larger public to read it, Malcolm Lowry's *Under the Volcano* obstinately remained a cult book, while the cultists performed their office of keeping the work alive until such time as popular taste should become sufficiently enlightened to appreciate it.

Student cultists

Detective, mystery, thriller. The terms detective story, mystery, and thriller tend to be employed interchangeably. The detective story thrills the reader with mysterious crimes, usually of a violent nature, and puzzles his reason

until their motivation and their perpetrator are, through some triumph of logic, uncovered. The detective story and mystery are in fact synonymous, but the thriller frequently purveys adventurous *frissons* without mysteries, like the spy stories of Ian Fleming, for example, but not like the spy stories of Len Deighton, which have a bracing element of mystery and detection. The detective novel began as a respectable branch of literature with works like Poe's "Murders in the Rue Morgue" (1841), Dickens' unfinished *Edwin Drood* (1870), and Wilkie Collins' *Moonstone* (1868) and *Woman in White* (1860). With the coming of the Sherlock Holmes stories of Sir Arthur Conan Doyle, at the beginning of the 20th century, the form became a kind of infraliterary subspecies, despite the intellectual brilliance of Holmes's detective work and the high literacy of Doyle's writing. Literary men like G.K. Chesterton practiced the form on the margin, and dons read thrillers furtively or composed them pseudonymously (*e.g.*, J.I.M. Stewart, reader in English literature at Oxford, wrote as "Michael Innes"). Even the British poet laureate, C. Day Lewis, subsidized his verse through writing detective novels as "Nicholas Blake." Dorothy L. Sayers, another Oxford scholar, appeared to atone for a highly successful career as a mystery writer by turning to religious drama and the translating of Dante, as well as by making her last mystery novel—*Gaudy Night* (1935)—a highly literary, even pedantic, confection.

Such practitioners as Agatha Christie, Ellery Queen, Erle Stanley Gardner, Raymond Chandler, to say nothing of the highly commercial Edgar Wallace and Mickey Spillane, have given much pleasure and offended only the most exalted literary canons. The fearless and intelligent amateur detective, or private investigator, or police officer has become a typical hero of the modern age. And those qualities that good mystery or thriller writing calls for are not to be despised, since they include economy, skillful sustention of suspense, and very artful plotting.

The mystery novel was superseded in popularity by the novel of espionage, which achieved a large vogue with the James Bond series of Ian Fleming. Something of its spirit, if not its sadism and eroticism, had already appeared in books like John Buchan's *Thirty-nine Steps* and the "entertainments" of Graham Greene, as well as in the admirable novels of intrigue written by Eric Ambler. Fleming had numerous imitators, as well as a more than worthy successor in Len Deighton. The novels of John Le Carré found a wide audience despite their emphasis on the less glamorous, often even squalid aspects of international espionage; his works include *The Spy Who Came in from the Cold* (1963) and *Smiley's People* (1980).

Western. Man's concern with taming wild land, or advancing frontiers, or finding therapy in reversion from the civilized life to the atavistic is well reflected in adventure novels, beginning with James Fenimore Cooper's novels of the American frontier *The Pioneers* (1823) and *The Last of the Mohicans* (1826). As the 19th century advanced, and new tracts of America were opened up, a large body of fiction came out of the men who were involved in pioneering adventure. Mark Twain's *Roughing It* (1872) may be called a frontier classic. Bret Harte wrote shorter fiction, like "The Luck of Roaring Camp" (1868), but helped to spread an interest in frontier writing to Europe, where the cult of what may be termed the western novel is as powerful as in America. Owen Wisters' *Virginian* (1902), Andy Adams' near-documentary *Log of a Cowboy* (1903), Emerson Hough's *Covered Wagon* (1922), from which the first important western film was made in 1923, Hamlin Garland's *Son of the Middle Border* (1917), and O.E. Rölvaag's *Giants in the Earth* (1927) all helped to make the form popular, but it is to Zane Grey—who wrote more than 50 western novels —that lovers of frontier myth have accorded the greatest devotion. The western is now thought of predominantly as a cinematic form, but it arose out of literature. Other frontier fiction has come from another New World, the antipodes—South Africa as well as the Australian outback—but the American West has provided the best mythology, and it is still capable of literary treatment. Sophisticated literary devices may be grafted onto the western—surrealistic fantasy or parallels to Shakespeare or to the ancient classics—but the peculiar and perennial appeal of the western lies in its ethical simplicity, the frequent violence, the desperate attempt to maintain minimal civilized order, as well as the stark, near-epic figures from true western history, such as Billy the Kid, Calamity Jane, Wyatt Earp, Annie Oakley, and Jesse James.

The enduring and the ephemeral

The best-seller. A distinction should be made between novels whose high sales are an accolade bestowed on literary merit and novels that aim less at aesthetic worth than at profits. The works of Charles Dickens were best-sellers in their day, but good sales continue, testifying to a vitality that was not purely ephemeral. On the other hand, many best-selling novels have a vogue that is destined not to outlast the time when they were produced. It is a characteristic of this kind of best-seller that the writing is less interesting than the content, and that the content itself has a kind of journalistic oversimplification that appeals to unsophisticated minds. The United States is the primary home of the commercial novel whose high sales accrue from careful, and sometimes cold-blooded, planning. A novel in which a topical subject—such as the Mafia, or corruption in government, or the election of a new pope, or a spate of aircraft accidents, or the censorship of an erotic book—is treated with factual thoroughness, garnished with sex, enlivened by quarrels, fights, and marital infidelities, presented in nonliterary prose, and given lavish promotion by its publisher may well become a best-seller. It is also likely to be almost entirely forgotten a year or so after its publication. The factual element in the novel seems to be necessary to make the reader feel that he is being educated as well as diverted. Indeed, the conditions for the highest sales seem to include the reconciliation of the pornographic and the didactic.

A novel with genuine aesthetic vitality often sells more than the most vaunted best-seller, but the sales are more likely to be spread over decades and even centuries rather than mere weeks and months. The author of such a book may, in time, enrich others, but he is unlikely himself to attain the opulence of writers of best-sellers such as Harold Robbins or Irving Wallace.

Fantasy and propheey. The term science fiction is a loose one, and it is often made to include fantastic and prophetic books that make no reference to the potentialities of science and technology for changing human life. Nevertheless, a novel like Keith Roberts' *Pavane* (1969), which has as a premise the conquest of England by Spain in 1588, and the consequent suppression rather than development of free Protestant intellectual inquiry, is called science fiction, though such terms as "fiction of hypothesis" and "time fantasy" would be more fitting. The imaginative novelist is entitled to remake the existing world or present possible future worlds, and a large corpus of fiction devoted to such speculative visions has been produced in the last hundred years, more of it based on metaphysical hypotheses than on scientific marvels. Jules Verne and H.G. Wells pioneered what may be properly termed science fiction, mainly to an end of diversion. Since the days of Wells's *Time Machine* (1895) and *Invisible Man* (1897), the fiction of hypothesis has frequently had a strong didactic aim, often concerned with opposing the very utopianism that Wells—mainly in his nonfictional works—built on the potentialities of socialism and technology. Aldous Huxley's *Brave New World* (1932) showed how dangerous utopianism could be, since the desire for social stability might condone conditioning techniques that would destroy the fundamental human right to make free choices. Toward the end of his life Huxley produced a cautious utopian vision in *Island* (1962), but the dystopian horrors of his earlier novel and of his *Ape and Essence* (1948) remain more convincing. Orwell's *Nineteen Eighty-four* (1949) showed a world in which a tyrannic unity is imposed by a collective solipsism, and contradictions are liquidated through the constant revision of history that the controlling party decrees. Anthony Burgess' *Clockwork Orange* (1962) and *Wanting Seed* (1962) portray ghastly futures that extrapolate, respectively, philosophies of crime control and population control out of present-day tendencies that are only potentially dangerous.

A large number of writers practice prophetic fantasy with considerable literary skill and careful factual preparation—Kurt Vonnegut, Jr., Ray Bradbury, Italo Calvino, Isaac Asimov, J.G. Ballard, to name only a few—and novelists whose distinction lies mainly in more traditional fields have attempted the occasional piece of future-fiction, as in the case of L.P. Hartley with his *Facial Justice* (1961) and Evelyn Waugh in *Love Among the Ruins* (1953). The fantasist who fantasizes without prophetic or warning intent is rarer, but works such as Nabokov's *Ada,* Tolkien's *Lord of the Rings* cycle, and Christine Brooke-Rose's *Out* (1964) represent legitimate and heartening stretching of the imagination, assurances that the novelist has the right to create worlds, as well as characters, of his own. However, the dystopian novel can have a salutary influence on society, actively correcting regressive or illiberal tendencies, and *Brave New World* and *Nineteen Eighty-four* can be cherished as great didactic landmarks, not just as works of literary art.

Proletarian. The novel that, like Dickens' *Hard Times* (1854), presents the lives of workingmen or other members of the lower orders is not necessarily an example of proletarian fiction. The category properly springs out of direct experience of proletarian life and is not available to writers whose background is bourgeois or aristocratic. Consequently, William Godwin's *Caleb Williams* (1974), or Robert Bage's *Hermsprong* (1796), although, like *Hard Times,* sympathetic to the lot of the oppressed worker, is more concerned with the imposition of reform from above than with revolution from within, and the proletarian novel is essentially an intended device of revolution. The Russian Maksim Gorky, with works like *Foma Gordeyev* (1900) and *Mother* (1907), as well as numerous short stories portraying the bitterness of poverty and unemployment (in fact, the pseudonym *Gorky* means "Bitter"), may be taken as an exemplary proletarian writer. The United States has produced a rich crop of working-class fiction. Such Socialist writers as Jack London, Upton Sinclair, John Dos Passos, and Edward Dahlberg, however, did not witness the triumph of the workers' revolution in their own country, as Gorky did in his, and it is the fate of the American proletarian novelist, through literary success, either to join the class he once dreamed of overthrowing or to become anarchic and frustrated. In the Soviet Union the proletarian novel was doomed to disappear in the form that Gorky knew, for it is the essence of the revolutionary novel to possess vitality and validity only when written under capitalist "tyranny."

Reform versus revolution

England has produced its share of working-class novelists exuding bitterness, such as Alan Sillitoe, with his *Saturday Night and Sunday Morning* (1958), but conditions apt for revolution have not existed in Britain for more than a century. British novelists who emerged after World War II, such as John Braine (*Room at the Top*), Keith Waterhouse (*There Is a Happy Land*), Kingsley Amis (*Lucky Jim*), and Stan Barstow (*A Kind of Loving*), provided a solution to working-class frustration in a fluid system of class promotion: revolution is an inadmissible dream. Generally speaking, in the novel, which is preoccupied with individuals rather than with groups, it is difficult to make the generalized political statements that are meat and drink to the revolutionary propagandist.

Other types. The categories briefly discussed above are among the most common fictional forms. Theoretically there is no limit to the number available, since changing social patterns provide fresh subjects and fresh taxonomies, and new metaphysical and psychological doctrines may beget new fictional approaches to both content and technique.

Other categories of fictional art include the erotic novel (which may or may not be pornographic), the satirical novel, the farcical novel, the novel for or about children, the theological novel, the allegorical novel, and so on. Types of fiction no longer practiced, since their real-life referents no longer exist, include the colonial novel—such as E.M. Forster's *Passage to India* (1924), Henri Fauconnier's *Malaisie* (1930), and the African sequence of Joyce Cary—and space fantasy like H.G. Wells's *First Men in the Moon* (1901). One may read examples of a departed category with pleasure and profit, but the category can no longer yield more than parody or pastiche.

Outmoded types

New kinds of fiction fill in the gaps, like the novel of negritude, the structuralist novel (following the linguistic sociologists and anthropologists), the homosexual novel, the novel of drug hallucination, and so on. So long as human society continues to exist, the novel will exist as its mirror, an infinitude of artistic images reflecting an infinitude of life patterns.

THE NOVEL IN ENGLISH

The United Kingdom. England's chief literary achievements lie in the fields of drama and poetry, and the attitude of English novelists to their form was, for a long time, cheerfully empirical and even amateurish. Elizabethan novels, *novelle* rather, imitated the Spanish picaresque story, and Thomas Nashe's *Unfortunate Traveller* (1594) is a good, bustling, vital example of a rapidly composed commercial work more concerned with sensational incident and language than with shape or character. Daniel Defoe (1660?–1731) is often considered to be the true progenitor of the long English novel, but his *Robinson Crusoe* and *Moll Flanders* are loosely constructed, highly episodic, and presented as mock biography rather than real fiction. It is with *Pamela,* by Samuel Richardson (1689–1761), that the tradition of serious, moral fiction in English may be said to begin, but later 18th-century novelists reverted to the picaresque and comic. Henry Fielding (1707–54) wrote his first novel, *Joseph Andrews,* as parody on *Pamela,* but his masterpiece, *Tom Jones,* is original if shapeless, an example of English literary genius sinking thankfully back into the casual and improvisatory. Laurence Sterne (1713–68) produced a great mad work, *Tristram Shandy,* that, in its refusal to truckle to any rules of structure, remains still a quarry for avant-garde novelists; and Tobias Smollett (1721–71) wrote picaresque satire in *Roderick Random* and *Peregrine Pickele,* full-blooded portraits of the age that impress more with their vigour than with their art.

The Romantic and Victorian ages

The Romantic Age brought, rather paradoxically, the cool and classically shaped novels of Jane Austen (1775–1817), a major practitioner and still a model for apprentices in the craft. Sir Walter Scott (1771–1832), a Scotsman who wrote about romantic historical Scotland, must be regarded as an international figure whose influence was greater even than Richardson's, since he more than anyone established the historical novel as the primary fictional form in Europe. In Scott's work, nevertheless, the traditional faults of the British novel may be descried—namely, episodic formlessness, an ebullience of texture rather than a clean narrative line.

The Victorian Age moved out of the romantic past, or, as with William Makepeace Thackeray (1811–63), stayed with it only to deromanticize it. Charles Dickens (1812–70) was indebted to the picaresque tradition but turned reformist eyes on his own age. Thackeray and Dickens are complementary in that the first attacks the upper classes while the second showers sympathy, sometimes of a mawkish kind, on the lower classes. With George Eliot (1819–80), the first true English psychological novels appear, strong in their moral content, and George Meredith (1828–1909) may be said to have anticipated—in *The Ordeal of Richard Feverel* and *The Egoist*—the approach in depth that characterized the psychological novel of the 20th century.

Both Charlotte Brontë (1816–55) and Emily Brontë (1818–48) exemplify the capacity of the English novel to achieve solitary "sports" unrelated to any current or tradition. Both *Wuthering Heights*—a superb evocation of the soul of a locality, with a love story that is fierce and primitive but recounted with poetic sophistication—and *Jane Eyre,* an exceedingly frank and still shocking study of a love that rides over Victorian conventions, are unlike any other books of their time, or of any other time, though their qualities have been diluted into hundreds of popular 20th-century romances. Later Victorians, particularly Samuel Butler (1835–1902) and Thomas Hardy (1840–1928), reflected those changes in the educated English sensibility that had been brought about by the new science.

Hardy's world is one in which the Christian God has been replaced by a malevolent Providence—the poet-novelist's theologization of scientific determinism. Butler's *Way of All Flesh*, a work that contrives to be both bitterly realistic and highly comic, demonstrates the working of Darwinian evolution in social institutions such as the family and even the church. In many ways, Butler led English fiction into the modern age.

John Galsworthy (1867–1933) showed himself interested in the processes by which old institutions, such as a great Whig family, decay as history advances, but in both style and characterization he is firmly set in the Victorian Age. Of Arnold Bennett (1867–1931) it may be said that he brought to a kind of Thackerayan social realism something of the spirit of the French novel, particularly the anglicized tones of Balzac and Zola. W. Somerset Maugham (1874–1965), though his most considerable achievements lie in the short-story form, wrote novels, like *Of Human Bondage*, that are infused with the delicious acerbities of French naturalism, and all his work, long or short, is exalted by the influence of Guy de Maupassant.

Impact of non-British writers

Early 20th-century British fiction needed the impact of an alien tradition to jolt it out of bourgeois empiricism, and perhaps the two major influences were both foreigners who had elected to write fiction in England—Joseph Conrad (1857–1924), Polish-born, to whom English was a second language, and Henry James (1843–1916), an American who had drunk deeply at French fountains and brought to the exercise of his craft a scrupulousness and a concern with aesthetic values that was almost obsessive and, it may be said, very un-English. James's influence on such major English-born novelists as Virginia Woolf (1882–1941), E.M. Forster (1879–1970), and Ford Madox Ford (1873–1939) was in the direction of that concern with style which the English novel, unlike the French, has always tried to resist, and this influence remains a potent one on succeeding generations of novelists, not only in England.

Other important Englishmen have remained more interested in content than in style, though in Graham Greene, a Catholic convert, who is primarily known for his "theological" content, there is a very interesting attempt to bring to this a Conradian concern for the solitary-man theme and a Jamesian preoccupation with style. D.H. Lawrence (1885–1930) remains the great modern English novelist who reconciles a highly traditional style (in *The Rainbow*, for example, he often resembles George Eliot) with a subject matter that is revolutionary in the profundity of its human relationships. And Aldous Huxley (1894–1963), though he indulged in formal experiment in *Point Counter Point* and *Eyeless in Gaza*, was always essentially a didactic writer who used the novel form somewhat casually. The same may be said of George Orwell (1903–50), who eschewed stylistic complexity in the interest of a clear message. On the other hand, Evelyn Waugh (1902–66) and Anthony Powell, in a cautious and conservative way, consulted the claims of allusive and evocative prose, as did Wyndham Lewis (1884–1957), who also brought to his novels the aesthetic of an alien art—that of painting.

Novelists like Kingsley Amis and Angus Wilson are seen to belong to traditions already old in the time of Samuel Butler. Amis derives from Fielding (Amis' *Take a Girl Like You* has a moral quality reminiscent of Fielding's *Amelia*), and Wilson never pretends to be other than a disciple of novelists like George Eliot and Dickens. The Victorian kind of novel, as practiced by writers like J.B. Priestley, satisfies large numbers of British readers, and Jamesian scrupulosity and Joycean experiment alike are regarded with amiable suspicion. Such Englishmen as have experimented in fictional technique have usually found a larger audience abroad than at home. Thus Lawrence Durrell found his *Alexandria Quartet* (1962) hailed as a masterpiece in France, while English readers merely liked or disliked it. *A Clockwork Orange* (1962) by Anthony Burgess achieved a large readership in the United States, but it recorded little positive response in the country of its origin.

The fiction of the British Isles is not clearly differentiated into national or regional groups, and to speak of Irish novelists is often to do no more than refer to an irrelevant place of birth. Oscar Wilde (1854–1900) was more French than Irish; his one novel, *The Picture of Dorian Gray*, has no progenitors in English fiction, but it owes much to the late 19th-century French novelist Joris-Karl Huysmans.

Irish and Scottish novels

George Moore (1852–1933) was born in County Mayo, Ireland, but studied art in Paris, and works like *A Modern Lover* and *A Mummer's Wife* were intended to teach the British novel how to absorb the spirit of Flaubert and Zola. Moore's *Lake*, written under the influence of the Irish literary revival, is dutifully set in Ireland, but this essentially international writer was quick to move back to France for *Héloïse and Abélard* and on to Palestine for *The Brook Kerith*. James Joyce (1882–1941), conceivably the greatest novelist in English in the 20th century, never moves from his native Dublin in any of his fiction, but no less parochial writer can well be imagined. *Ulysses*, in the depth of its historical coverage, may be regarded as one of the last great artistic monuments of the Austro-Hungarian Empire, and *Finnegans Wake* was stimulated by the avant-garde climate of Paris, the resting place of so many Irish "wild geese." It is only perhaps negatively that Ireland shaped Joyce's literary personality; the oppressiveness of the new nationalism made him react in the direction of internationalism, and it eventually forced him to a lifelong exile. Flann O'Brien (1911–66), possibly Joyce's true successor, stayed in Dublin and drew, in works like *At Swim-Two-Birds* (1939) and *The Hard Life* (1961), on the native demotic experience, but his techniques came from Europe, not from the Anglo-Irish bourgeois stockpot.

The Scottish novel hardly exists as a national entity; there is nothing in fiction that matches the exploitation of Lallans in the poetry of Burns or of Hugh MacDiarmid (C.M. Grieve). Scott, as has been indicated, belongs to European literature, and later novelists like Robert Louis Stevenson (1850–94) and Sir James Barrie (1860–1937), though Scottish themes and settings are featured triumphantly in their fiction, are essentially men whose literary metropolis was London rather than Edinburgh.

Wales sedulously cultivates Welsh as a living artistic medium, but few novels by Welshmen reach the English or international market, unless—like Emyr Humphreys—they write their works in English as well as Welsh. The English-language novel from Wales hardly exists, except in the form of best-sellers like Richard Llewellyn's *How Green Was My Valley* (1940)—a deliberate capitalization on Welsh picturesqueness—and the exceedingly Joycean prose of the poet Dylan Thomas (1914–53), whose one novel, *Adventures in the Skin Trade*, has very little of Wales in it.

The United States. If the American novel appears to begin with the *Wieland* and *Edgar Huntly* of Charles Brockden Brown (1771–1810), then the fiction of the mother country may be said to have no start on that of the newly independent daughter. Admittedly, Brown owes something to the English Gothic novel, but already a typically American note is struck in the choice of a violent and bizarre form that, in various mutations, was to prove fruitful in the development of American fiction. James Fenimore Cooper (1789–1851) struck out, in the pentateuch called the "Leatherstocking" tales, in another direction suitable to the American genius and experience: *The Last of the Mohicans* and *The Prairie*, though their prose style is perhaps overelaborate, are full of the spirit of a young nation confronting the wilderness and advancing its frontiers. Harriet Beecher Stowe (1811–96) produced, in *Uncle Tom's Cabin*, an antislavery novel whose sensational devices owe something to the Gothic movement but whose style is rooted in that European romantic tradition fathered by Scott. Even Edgar Allan Poe (1809–49) and Nathaniel Hawthorne (1804–64) are incompletely emancipated from Europe, though Hawthorne's *Scarlet Letter* shows a preoccupation with sin that finds no fictional counterpart in the mainstream of the European novel. America, aware of the darkness and mystery of a land still mainly undiscovered, was correspondingly aware, in both Gothic and eschatological fiction, of the dark places of the mind.

The true emancipation from Europe comes in the works of Hawthorne's friend Herman Melville (1819–91), whose

Moby Dick creats a totally American fusion by combining plain adventure with a kind of Manichaean symbolism—implying a belief that the universe is under the dominion of two opposing principles, one good and the other evil. Mark Twain (1835–1910) brought the Mississippi frontier region into the literary geography of the world with *Tom Sawyer* and *Huckleberry Finn*, combining very American humour with harsh social criticism, as also in the unique *Pudd'nhead Wilson*. From Twain on, the new regions of the United States become the materials of a wealth of fiction. Thus, while Bret Harte (1836–1902) wrote about California and George W. Cable (1844–1925) on Louisiana, Indiana was celebrated in *The Hoosier Schoolmaster* of Edward Eggleston (1837–1902) and the *Penrod* stories of Booth Tarkington (1869–1947).

American innocence and European sophistication

But America could not wholly turn its back on Europe, and the early 20th century was characterized by the discovery of the phenomenon called American "innocence" in confrontation with the decadent wisdom and sophistication of the Old World. If, in *Innocents Abroad*, Mark Twain and his fellow travellers remained unimpressed by Europe, Henry James (1843–1916) devoted millions of words to the response of impressionable Americans to the subtle deciduous culture their ancestors had abandoned in the search for a new life. Zolaesque realism entered the American novel with William Dean Howells (1837–1920). Theodore Dreiser (1871–1945) shocked his audiences with the candour and pessimism of *Sister Carrie* and *An American Tragedy*, while Stephen Crane (1871–1900) and Frank Norris (1870–1902) made realism enter, respectively, the traditionally romantic field of war (*The Red Badge of Courage*) and the pastoral life of the promised land of California (*The Octopus*). American innocence ceased to be a fictional property. The brutality in Jack London (1876–1916) joins hands with the depictions of "natural man" in the works of Ernest Hemingway (1899–1961), while the urban fiction of James T. Farrell (1904–79) and John O'Hara (1905–70) has a wholly American realism that leaves the naturalism of Zola far behind.

The 20th-century American novel is "compartmentalized" in a manner that seems to give the lie to any allegation of cultural unity. The cult of the regional novel has continued. Ohio came under the microscopic scrutiny of Sherwood Anderson (1876–1941) in *Winesburg, Ohio*, just as the small-minded hypocrisy and materialism of the Midwest fired the brilliant sequence of Sinclair Lewis (1885–1951) from *Main Street* on. But the best regional fiction has come from the South, with William Faulkner (1897–1962), whose technical master is Joyce, Ellen Glasgow (1874–1945), Flannery O'Connor (1922–64), Eudora Welty, Erskine Caldwell, and Robert Penn Warren. The immigrant communities of Nebraska were the subject of *My Antonia*, by Willa Cather (1873–1947), while O.E. Rölvaag (1876–1931) dealt with the South Dakota Norwegians in *Giants in the Earth*. The urban Jew has become the very spokesman of the contemporary American experience with writers like Saul Bellow, Herbert Gold and Bernard Malamud; while the black American has been made highly articulate in works like *Go Tell It on the Mountain* by James Baldwin, *Invisible Man* by Ralph Ellison, and *Home to Harlem* by Jamaican-born Claude McKay (1890–1948).

Meanwhile, the fiction of social criticism that derives from Howells and was made popular by men like Upton Sinclair (1878–1968) goes on, either in "muckraking" best-sellers or in such specialized attacks on the American ethos as are exemplified by war books like Joseph Heller's *Catch-22* and Kurt Vonnegut's *Slaughterhouse-Five*. American realism has gained a reputation for candour unequalled in any other literature of the world, so that the *Tropic of Cancer* and *Tropic of Capricorn* of Henry Miller (1891–1980) remain models for sexual frankness that encouraged writers like Hubert Selby, Jr. (*Last Exit to Brooklyn*), and Philip Roth (*Portnoy's Complaint*) to uncover areas of eroticism still closed to the European novel.

To balance the concern with naked subject matter, American fiction has also fulfilled the promise of its earlier expatriates beginning with Gertrude Stein (1874–1946) to match the French in a preoccupation with style. The distinction of F. Scott Fitzgerald (1896–1940) lay in the lyrical intensity of his prose as much as in his "jazz age" subject matter, and writers like Truman Capote and John Updike have dedicated themselves similarly to perfecting a prose instrument whose effects (like those of Joyce) touch the borders of poetry. Perhaps the glories and potentialities of American fiction are best summed up in the novels of Vladimir Nabokov (1899–1977). His early works belonged to Europe, but when he took to writing in English he created a sophisticated, cosmopolitan, and highly poetic style. His work, as in *Lolita* and *Pale Fire*, concentrates with unparalleled intensity on the immediacies of American life in the 20th century.

The British Commonwealth. Canada has two literatures—one in French as well as one in English—and, in the taxonomy of this article, it will be as well to forget the course of history and consider French-Canadian novelists along with those of the separated, and officially abandoned, mother country. The Canadian novel in English begins, appropriately enough, with a Richardson—John Richardson (1796–1852), author of *Wacousta*, a story of the Indian uprising led by Pontiac. But, with the exception of James DeMille (1836–80), author of a remarkable novel, *A Strange Manuscript Found in a Copper Cylinder*, and William Kirby (1817–1906), whose *Golden Dog* is an interesting long romance of 18th-century Quebec, no novelist of stature emerged in what was a great period of literary expansion in the United States. The historical novels of Sir Gilbert Parker (1862–1932), the western romances of Ralph Connor (1860–1937), and the world-famous *Anne of Green Gables* by Lucy Maud Montgomery (1874–1942) exhibit a stylistic tameness, along with that jejune oversimplification of psychology that is a mark of the deliberately "popular" novel.

More distinctive Canadian work came in the early 20th century, as in the prairie novels of Robert Stead (1880–1959) and Frederick Philip Grove (1871–1948). Morley Callaghan, a chronicler of urban life, may be seen as a writer approaching international stature, and that tough "European" realism that braces his work is also to be found, along with a rather exotic elegance, in the novels of Robertson Davies. Although some younger novelists, like Margaret Atwood and Alice Munro, deal with growing up and rites of passage in Canada, others, like Brian Moore and Mordecai Richler, have sought artistic stimulation outside Canada, and they show general uneasiness about the lack of a cultivated audience in their great but underpopulated land.

Australian and New Zealand novels

A similar complaint may be heard in Australia and New Zealand, where the fictional tradition has long accommodated itself to the simple literary needs of unsophisticated settlers. The first true Australian novel was probably *For the Term of His Natural Life*, by Marcus Clarke (1846–81), which dealt, appropriately, considering the penal origins of the Australian settlements, with life in prison; and Rolf Boldrewood, the pseudonym of Thomas A. Browne (1826–1915), had a cognate approach of excessive simplicity and melodrama to the days of the gold rush in his *Robbery Under Arms*. Australian farm life was the theme of the novels that Arthur Hoey Davis (1868–1935) wrote under the pen name of Steele Rudd, beginning with *On Our Selection*. But something that can only be termed native Australianism—which has less to do with trades and scenic backgrounds than with a whole new language and collective philosophy of life—appears for the first time in *My Brilliant Career* (1901), by Miles Franklin (1879–1954). The expression of a national personality is not, however, enough.

Progressive 20th-century Australian novelists look hungrily toward Europe, aware that native conservatism will not support the kind of experimentalism in literature that it is prepared to take for granted in painting and architecture. The most considerable modern Australian novelist is Patrick White, but even such massive achievements as *Voss* and *Riders in the Chariot* are set firmly in the Dostoyevskian tradition. Morris West is Australian only by birth; he seeks international themes and the lure of the American best-seller market. It seems that an Australian writer can succeed only if he renounces his Australianism

and goes into exile. It is still a source of humiliation to Australian litterateurs that the finest novel about Australia was written by a mere visitor—*Kangaroo* (1923), by D.H. Lawrence.

New Zealand, with its much smaller population, presents even greater problems for the native novelist seeking an audience, and this—along with New Zealand's closer tie with the mother country—explains why such fiction writers as Katherine Mansfield (1888–1923) and Dame Ngaio Marsh (1899–1982) made London their centre. Young novelists like Janet Frame, Ian Cross, and Maurice Shadbolt show, however, a heartening willingness to render the New Zealand scene in idioms and techniques more progressive than anything to be found in Australia, and they are prepared to resist the temptations of the expatriate life.

Inevitably, territories like India and Africa entered the federation of English literature very much later than those dominions founded on the English language. With few exceptions, African and Indian novelists employ English as a second language, and one of the charms of their novels lies in a creative tension between the adopted language and the native vernacular (needless to say, this is usually self-consciously exploited—often for poetic, but more frequently for comic, effect).

English as a second language of the novelist

Of Indian novelists, R.K. Narayan, in works like *The English Teacher* (U.S. title *Grateful to Life and Death*) and *The Man-Eater of Malgudi*, exhibits an individual combination of tenderness and humour, as well as a sharp eye for Indian foibles. Raja Rao, whose best known novel is *The Serpent and the Rope*, achieves remarkable prosodic effects through allowing Sanskrit rhythm and idiom to fertilize English. Of younger Indian novelists, Balachandra Rajan is notable, in *The Dark Dancer* and *Too Long in the West*, for an ability to satirize the Anglo-American way of life with the same suave elegance that informs his tragicomic view of the East. Khushwant Singh presents, in *I Shall Not Hear the Nightingale*, a powerful chronicle of Sikh life during that period of imperial dissolution that began with World War II. English seems established as the medium for the Indian novel, and it is interesting to note an ability on the part of nonnative Indian residents who have practiced the form to be absorbed into a new "Indo-Anglian" tradition. Rudyard Kipling's *Kim* is respected by Indian writers, and E.M. Forster's *Passage to India* is a progenitor of one kind of Indian novel. The novels of Paul Scott (1920–78)—such as the tetralogy *The Raj Quartet* (1976)—spring out of a love of the country and an understanding of its complexities not uncommon among former British soldiers and administrators. The Indian novel is perhaps a product of territory rather than of blood.

African novelists

The most important of the new African writers come from the West Coast, traditional fount of artists, and they are mostly characterized by immense stylistic vigour, a powerful realism, and, often, a satirical candour unseduced by the claims of the new nationalism. Chinua Achebe, in *Things Fall Apart* and *No Longer at Ease*, renders remarkably the tones of Umuaro speech and thought, and exhibits, as also in *Arrow of God*, a concern for that rich native culture whose extirpation is threatened by imported Western patterns of life and government. His *Man of the People* deals sharply with corruption and personality cult in a newly independent African state modelled on his own Nigeria. A fellow Nigerian, Amos Tutuola, has gained an international reputation with *The Palm-Wine Drinkard*—a richly humorous novel permeated with the spirit of folklore. Cyprian Ekwensi is best known for his *Jagua Nana*, a wry study of the impact of the new materialism (symbolized by the "Jagua" car of the title) on the tribal mind. Onuora Nzekwu, in *Blade Among the Boys*, has a graver theme: the conflict between Ibo religion and imported Christianity in the upbringing of a sensitive and confused young man.

South African novels have, traditionally, dealt with those pioneering themes still exemplified in the work of Laurens van der Post and Stuart Cloete, but the territory has made its entry into world literature comparatively recently chiefly because the official racist policies have inspired a powerful fiction of protest. William Plomer (1903–73) may be regarded as the father of anti-apartheid literature, although his *Turbott Wolfe* appeared in 1925, long before the state doctrine was articulated. The theme of this novel was the necessity for white and black blood to mix and ensure a liberal South African future not given over purely to white domination. Alan Paton, in *Cry, the Beloved Country*, has produced the most popular novel of protest, but Dan Jacobson, Nadine Gordimer, and especially Doris Lessing have amplified mere protest into what may be termed a kind of philosophical fiction, often distinguished enough to rank with the best work of Europe and America. Lessing's sequence *Children of Violence* finds in the South African system of government a starting point for denunciation of wrongs that turn out to be social and sexual as well as racial.

Caribbean works

The varied fictional achievements of the Caribbean are large. Trinidad has produced the two best known West Indian writers—Samuel Selvon and V.S. Naipaul, both of East Indian descent. Selvon's work (*A Brighter Sun, An Island Is a World, The Lonely Londoners*) is grim, bitter, capable of vivid evocation of the Trinidadian scene, but Naipaul, after *A House for Mr. Biswas*, has shown signs of habituation to his English exile, so that his *Mr. Stone and the Knights Companion* seems to be a novel totally nourished by the London world in which it is set. Most Caribbean novelists, finding their publishers and their audiences in England, transfer themselves thither and cut themselves off from all but remembered roots. This is true of Edgar Mittelhölzer (1909–65), an ebullient and prolific writer whose later books all had English settings. Wilson Harris has, in English exile, created an astonishing Guianan tetralogy in which poetry and myth and symbolic difficulty have a place. George Lamming and John Hearne are both notable for firm and economical prose and masterly scene painting. The aesthetic prospects for the West Indian novel seem excellent, but the absorption of its practitioners into the larger English-speaking world represents a symptom that plagues the practice of literature in so many Commonwealth countries—the lack of adequate publishing facilities and, more than that, the failure of a cultivated readership to emerge. It is undoubtedly unhealthy for an author to have to seek primary communication with foreigners.

EUROPE

Russian. The Russian novel properly begins with Nikolay Karamzin (1766–1826), who introduced into Russian literature not only the exotic sentimental romanticism best seen in his novels *Poor Lisa* and *Natalya, the Boyar's Daughter* but that large Gallic vocabulary that was to remain a feature of the literary language. But those qualities that best distinguish Russian fiction—critical realism and spirituality—first appeared in the work of Mikhail Lermontov (1814–41), whose *Hero of Our Time* is the pioneering Russian psychological novel. Nikolay Gogol (1809–52), satirizing provincial mores in *Dead Souls*, ushered in, perhaps unintentionally, a whole fictional movement—the "literature of accusation." Vissarion Belinsky (1811–48), the father of Russian literary criticism, formulated the theory of literature in the service of society, and Ivan Turgenev (1818–83), produced a classic "accusatory" novel in *A Sportsman's Sketches*. But he, and the other major novelists who emerged in the mid-19th century, can hardly be considered in terms of literary movements. Fyodor Dostoyevsky (1821–81), with *The Possessed, The Idiot, Crime and Punishment*, and *The Brothers Karamazov*, affirmed with idiosyncratic power the great spiritual realities, and Leo Tolstoy (1828–1910) produced two of the greatest novels of all time—*War and Peace* and *Anna Karenina*, revelatory of the Russian soul but also of the very nature of universal man and human society.

The influence of the Soviet government

The later days of the 19th century saw a shift in fictional radicalism. The theories of Karl Marx influenced the accusatory writers in the direction of the plight of the proletariat, not, as had been the old way, that of the peasantry. Maksim Gorky (1868–1936), Leonid Andreyev (1871–1919), Aleksandr Kuprin (1870–1938), and the Nobel Prize winner (1933) Ivan Bunin (1870–1953) wrote of the Russian urban experience and helped to create the literary climate of the Soviet regime. Generally, since

the beginning of the first five-year plan in 1928, there had been a division between what the regime regarded as valuable in the practice of the novel and what the rest of the world thought. Mikhail Sholokhov (1905–84) depicted, with no evident propagandist slanting, the Revolution and civil war in *Quiet Flows the Don,* and Fyodor Gladkov (1883–1958) was one of the few novelists readable outside the ranks of the Soviet devout in the new category of economic or industrial fiction. The Russian novel of the age following World War II, however, underwent a dramatic schism, in which writers like Aleksandr Solzhenitsyn and Boris Pasternak (1890–1960) could receive the Nobel Prize but be officially condemned in the Soviet Union, while the fictional darlings of the regime were recognized, in the non-Communist world, as possessing little or no aesthetic merit.

German. Goethe (1749–1832), who practiced so many arts with such notable brilliance, may be regarded as the first major novelist of Germany. His life covers the whole period of the Enlightenment, with its insistence on a national literary spirit, the *Sturm und Drang* movement, and that phase of *Weltschmerz* which *The Sorrows of Young Werther* fostered. It was *Werther* more than any other work that carried German literature into the world arena; it remained influential in Europe when German Romanticism had already burned itself out. The German reaction against Romanticism was expressed in the regionalism of Theodor Storm (1817–88) and Fritz Reuter (1810–74), who sought to render with objective fidelity the life of their native provinces (northwestern and northeastern Germany, respectively). Swiss writers like Gottfried Keller (1819–90) belonged to the movement of mainstream German regional realism, featuring the picturesque solidities of Switzerland. But the post-Goethean major achievements in the novel had to wait for the Impressionist movement, which produced the works of Thomas Mann (1875–1955) and Hermann Hesse (1877–1962)—fiction concerned less with a roughly hacked slice of life than with form and aesthetic delicacy. World War I brought Expressionism—the nightmares of the German-Czech Franz Kafka (1883–1924) and the psychoanalytical novels of Jakob Wassermann (1873–1934), with their pleas for humanity and justice.

Suppression of the novel by the Nazis

When the true historical nightmare of the Nazi regime followed—predicted, in a sense, by Kafka and Mann—liberal German fiction was suppressed, and liberal German novelists like Mann and Erich Maria Remarque (1898–1970), author of *All Quiet on the Western Front,* went into exile. The brutal, philistine, and nationalistic novels of the true Nazi novelists exist only as curious and frightening relics of an era of infamy. The task of postwar novelists like Günter Grass—author of *The Tin Drum* and *Dog Years*—and Uwe Johnson has been to diagnose the long sickness and force German fiction into new directions—often with the help of surrealism, irony, and verbal experiment.

French. Although the mid-16th-century satirical piece *Gargantua and Pantagruel* of François Rabelais has had, and is still having, a profound influence on the world novel, it would be wrong to place it in the line of true French fiction, which has always manifested a preoccupation with form, order, and economy—qualities totally un-Rabelaisian. The first notable French novel—*The Princess of Clèves* by Madame de La Fayette (1634–93)—shows none of the vices of the English novels of a century later; it is firmly constructed and takes character seriously, as does *Manon Lescaut* by l'Abbé Prévost (1697–1763). With such works the psychological novel was established in Europe. A keen hold on reality and a concern with the problems of man as a social being animates even the fiction of the Romantic school—works like *Indiana* and *Lélia* by George Sand (1804–76) and the heavyweight romances of Victor Hugo (1802–85). But the true glories of French fiction come with the reaction to romanticism and sentimentality, as exemplified in the novels of Jean-Jacques Rousseau (1712–78). The great fathers of realism are Stendhal (1783–1842), Balzac (1799–1850), and Flaubert (1821–80), and their influence is still active. Émile Zola (1840–1902) moved away from the artistic detachment that Flaubert preached and practiced, but, in his *Chronicles of the Rougon Macquart Family,* he tried to emulate the encyclopaedic approach to the novel of Balzac, whose *Human Comedy* is meant to be a history of society in a hundred episodes. The leader of the Naturalist school, Zola saw human character as a product of heredity and environment.

It was left to the 20th-century French novel to cast doubt on a mechanistic or deterministic view of man, to affirm the irrational element in his makeup, and to emphasize the primacy of the will. The temporal treadmill of Balzac and Zola has no place in the masterpiece of Marcel Proust (1871–1922); *Remembrance of Things Past,* if it has a philosophy, says more about the creative élan vital of Bergson, the human essences that underlie the shifting phenomena of time and space, than the social jungle the realists had taken for reality. André Gide (1869–1951) seems to make a plea for human aloofness from environment so that the essentially human capacity for change and growth may operate. André Malraux (1901–76), the forerunner of the Existentialist novelists, demonstrated, in *Man's Fate,* the necessity for human involvement in action as the only answer to the absurdity of his position in a huge and indifferent or malevolent universe. Jean-Paul Sartre (1905–80) and Albert Camus (1913–60) similarly emphasized man's freedom to choose, to say no to evil, to define himself through action.

Other French novelists have been more concerned with recording the minutiae of human life as a predominantly sensuous and emotional experience, like Colette (1873–1954), or with taking the religious sensibility as a fictional theme, like François Mauriac (1885–1970). The practitioners of the *anti-roman*—Butor, Robbe-Grillet, Nathalie Sarraute—pursue their attempts at liquidating human character in the traditional novelistic sense. Samuel Beckett, an Irishman who has turned himself into a major French stylist, goes his own way, presenting—in works like *Molly, Malone Dies, Watt,* and *The Unnamable*—mankind reduced to degradation and absurdity but somehow admirable because it survives.

French-Canadian novels

French-Canadian fiction inevitably suffers from comparison with the glories of the mother country. Before 1900 there is little of value to record—except perhaps the historical romance of Philippe de Gaspé (1786–1871), *Les Anciens Canadiens*—but Louis Hémon (1880–1913) produced a genuine classic in *Maria Chapdelaine,* a story of Canadian pioneer life, original, moving, and sensitive. The somewhat provincial character of French-Canadian life, dominated by the Church and by outmoded notions of morality, has not been conducive either to fictional candour or to formal experiment, and metropolitan France is unimpressed, for the most part, by the literature of the separated brethren. But there is time for an avant-garde to develop and great masters to appear.

The Golden Age in Spain

Spanish. The great age known as "El Siglo de Oro," or the Golden Age, produced what is conceivably (it must contest this claim with *War and Peace*) the most magnificent of all novels—the *Don Quixote* of Miguel de Cervantes Saavedra (1547–1616). A satire on chivalry that ends as a humane affirmation of the chivalric principle, it encloses—in tender or comic distortion—other fictional forms that flourished in the Spanish Golden Age. The *novela picaresca* fathered a whole European movement, and its best monuments are perhaps the anonymous *Lazarillo de Tormes* (1554), *Guzmán de Alfarache* by Mateo Alemán (1547–*c.* 1614), and *El diablo cojuelo* (*The Limping Devil*) by Luis Vélez de Guevera (1579–1644). The pastoral novel, another popular but highly stylized form, was less true fiction than a sort of prose poem, in which lovers in shepherd's disguise bewailed an unattainable or treacherous mistress. But here, since the fictional lovers were often real-life personages in the cloak of a rustic name, the germs of the *roman à clef* are seen stirring. The *novela morisca* was an inimitable Spanish form, a kind of fictional documentary about the wars between Christians and Muslims, as in *Guerras civiles de Granada* (*Civil Wars of Granada*) by Ginés Pérez de Hita (*c.* 1544–*c.* 1619).

The decline of Spain as a European power is associated, in literature, with feeble nostalgia for the Golden Age or feebler imitations of French classicism. The Spanish novel

began to reemerge only in the early 19th century, when a journalism celebrating regional customs encouraged the development of the realistic regional novel, with Fernán Caballero (1796–1877), Armando Palacio Valdés (1853–1938), and the important Vicente Blasco Ibáñez (1867–1928), whose *Sangre y arena* (*Blood and Sand*), *Mare nostrum*, and *Los cuatro jinetes del Apocalipsis* (*The Four Horsemen of the Apocalypse*) achieved universal fame and were adapted for the screen in the 1920s.

Generation of '98

The fiction of the Generation of '98—which took its name from the year of the Spanish-American War, a cataclysmic event for Spain that bereaved it of the last parts of a once great empire—wasted no time on national nostalgia or self-pity but concentrated on winning a new empire of style. Ramón María del Valle-Inclan (1866–1936) and Ramón Pérez de Ayala (1880–1962) brought a highly original lyricism to the novel, while Pío Baroja (1872–1956) concentrated on representing a world of discrete events, unbound by a unifying philosophy. The fiction that came out of the Civil War of 1936–39 returned to a kind of didactic realism, as with the novels of José Mariá Gironella, who depicted a ravaged and suffering Spain. Camilo José Cela, perhaps the most important modern Spanish novelist, combines realism with a highly original style. His *Familia de Pascual Duarte*—harrowing, compassionate, brilliantly economical—is a novel of towering merit.

Italian. Though Italy originated the novella, it was slow in coming to the full-length novel. There is little to record before *I promessi sposi* (*The Betrothed*) by Alessandro Manzoni (1785–1873), a romantic and patriotic novel that describes life in Italy under Spanish domination in the 17th century. That combination of regionalism and realism already noted in the fiction of Germany and Spain did not appear in Italy until after the unification in 1870, when Giovanni Verga (1840–1922) celebrated his native Sicily in *I malavoglia* (*The House by the Medlar Tree*) and Antonio Fogazzaro (1842–1911) showed life in northern Italy during the struggle for unification in *Picolo mondo antico* (*The Little World of the Past*). Gabriele D'Annunzio (1863–1938) and Luigi Pirandello (1867–1936) were too original for easy classification, and both worked in all the literary media. Pirandello, especially, helped to bring Italian literature into the modern world through such philosophical novels as *Il fu Mattia Pascal* (*The Late Matthew Pascal*), which raises profound questions about the nature of human identity and yet contrives to be witty, sunny, and essentially Italianate. The importance of Italo Svevo (1861–1928) was obscured for some time because of the difficulty of Italian literati in accepting his relatively unadorned style, but works like *La coscienza di Zeno* (1923; *Confessions of Zeno*) and *Senilitá* (a title that James Joyce, Svevo's friend and English teacher, translated *As a Man Grows Older*) are generally recognized as major contributions to the international novel.

Pirandello

The significant fiction of the Mussolini regime was produced by anti-Fascist exiles like Giuseppe Borgese (1882–1952) and Ignazio Silone (1900–78), whose *Pane e vino* (*Bread and Wine*) is accepted as a 20th-century classic. Alberto Moravia, with *La romana* (*The Woman of Rome*) and *La noia* (*The Empty Canvas*), is perhaps the most popular Italian novelist outside Italy, but he is probably less important than Giuseppe Berto, Cesare Pavese (1908–50), and Elio Vittorini (1908–66). Giuseppe di Lampedusa (1896–1957) created a solitary masterpiece in *Il gattopardo* (*The Leopard*). The experimental writing of Italo Calvino and Carlo Emilio Gadda has become better known outside Italy, but the Italian novel remains linguistically conservative and needs the impact of some powerfully iconoclastic literary figure like James Joyce.

Scandinavian languages. Norway is better known for Ibsen's contribution to the drama and Grieg's to music than for fiction of the first quality. Nevertheless, the novels of Knut Hamsun (1859–1952) earned him the Nobel Prize in 1920, and Sigrid Undset (1882–1949) received the same honour in 1928, though the work of both has failed to engage the lasting attention of world readers of fiction. In Denmark, Johannes Vilhelm Jensen (1873–1950), another Nobel Prize winner, Isak Dinesen (the pen name of Baroness Karen Blixen, 1885–1962), and Martin Nexö (1869–1954) have contributed to their country's fictional literature but made little mark beyond. Except for the Nobel Prize winners Eyvind Johnson (1900–76) and Harry Martinson (1904–78), the achievement of Sweden's novelists is inconsiderable. The novels of Halldór Laxness have restored to Iceland some of the literary fame it once earned for its sagas.

Slavic and East European languages. The greatest novelist of Czech origin, Franz Kafka, wrote in German, but writers in the vernacular include world-famous names such as Jarsoslav Hašek (1883–1923), whose *The Good Soldier Schweik* is acknowledged to be a comic masterpiece, and Karel Čapek (1890–1938), best known for the plays *R.U.R.* (which gave "robot" to the world's vocabulary) and *The Life of the Insects* but also notable for the novels *The Absolute at Large*, *Krakatit*, and *The War with the Newts*. The Czech fictional genius tends to the satrical and the fantastic. Serbian fiction gained international recognition in 1961 when Ivo Andrić won the Nobel Prize for his novels, notably those dealing with the history of Bosnia, which he had written during the second World War. Poland can claim two Nobel prizewinning novelists in Henryk Sienkiewicz (1846–1916), the author of *Quo Vadis?*, and Władysław S. Reymont (1868–1925), whose novel *The Peasants* is an aromatic piece of bucolic realism. Witold Gombrowicz (1904–69) wrote a novel, *Ferdydurke*, that was subjected to two separate modes of suppression—first Fascist, later Communist. A remarkable surrealist essay on "anal tyranny" and a depersonalization, it still awaits the acclaim that is due. Romania, which produced outstanding novelists in Eugen Lovinescu and Titu Maiorescu, suffered, like other Balkan countries, from the totalitarian suppression of the free creative spirit; but Dumitru Radu Popescu, author of *The Blue Lion*, was bold enough in the 1960s to question Communist orthodoxy through the medium of fiction. The work of the Hungarian Gusztáv Rab (1901–66) awaits recognition. His brilliant *Sabaria* develops very courageously the theme of the conflict between Communism and Christianity and reaches conclusions favourable to neither. It is a disturbing and beautifully composed book.

Czech fiction

Modern Greece, perhaps more famous for its poets George Seferis and Constantine Cavafy, has produced at least one major novelist in Níkos Kazantzákis (1885–1957), whose *Zorba the Greek* became famous through its film adaptation. *The Last Temptation of Christ*, which presents the life of Jesus as a struggle to overcome "the dark immemorial forces of the Evil One, human and prehuman," glows with the writer's personality and bristles with the dialectic that was one of the first Greek gifts to Western civilization.

Kazantzákis

The Jewish novel. The literature of the Diaspora—the dispersion of the Jews after their exile from ancient Babylonia—records many large achievements in the languages of exile and that dialect of Low German—Yiddish—which the Ashkenazi Jews have taken around the world. Perhaps the most interesting of modern Jewish novelists in Yiddish is Isaac Bashevis Singer, a naturalized American who refuses to be absorbed linguistically into America, unlike Bellow and Malamud, who have brought to the Anglo-American language typical tones and rhythms of the ghetto.

Israel, which is producing its own rich crop of national writers, began with an existing corpus of literature in modern Hebrew, a language promoted and nurtured by such scholars as Eliezer ben Yehuda (1858–1923) and the members of the neologizing Hebrew Academy of Israel. Among the early Hebrew novelists is Abraham Mapu (1808–67); among the later ones is the brilliant Moshe Shamir. The first Nobel Prize for Literature ever awarded to a Hebrew novelist went, justly, to Shmuel Yosef Agnon (1888–1970). The contemporary Hebrew novel is notable for a fusion of international sophistication and earthy homegrown realism.

ASIA, AFRICA, LATIN AMERICA

China. The tradition of storytelling is an ancient one in China, and the full-length novel can be found as far back as the late 16th century. The fiction of the 18th century

shows a variety of themes and techniques not dissimilar to those of Europe, with social satire, chivalric romance, and adventure stories. Ts'ao Chan (1715?–63) wrote a novel called *Hung lou meng* (translated as *Dream of the Red Chamber* in 1892), which has features not unlike those of Galsworthy's *The Forsyte Saga* and Mann's *Buddenbrooks*—a story of a great aristocratic family in decline, garnished with love interest and shot through with pathos. The early days of the 20th century saw the foundation of the Chinese republic and the development of popular fiction written in the vernacular style of Chinese called *pai-hua*.

From 1917 until the Sino-Japanese War (1937–45), a period of social and intellectual ferment, there was a great influx of Western novels, and, under their influence, movements like those devoted to realism and naturalism in Europe produced a great number of didactic novels. Novels like Lao She's *Rickshaw Boy* and Pa Chin's *Chinese Earth* appeared in the postwar period, but the Communist regime has quelled all but propagandist fiction. Such novels as Liu Ching's *Wall of Bronze,* Chao Shu-li's *Changes in Li Village,* and Ting Ling's *Sun Shines over the Sangkan River* are typical glorifications of the Maoist philosophy and the socialist achievements of the people.

Japan. A literature that admires economy, like the Japanese, is bound to favour, in fictional art, the short story above the full-length novel. Nevertheless, some of the ancient pillow-books, with their diary jottings and anecdotes, have the ring of autobiographical novels; while Murasaki Shikibu's *Tale of Genji,* produced nearly a thousand years ago, is a great and sophisticated work of fictional history. The 20th-century Japanese novel has been developed chiefly under Western influence, like the work of Akutagawa Ryūnosuke (1892–1927), whose short stories "Rashōmon" and "Yabu no naka" became the highly applauded film *Rashomon.* Tanizaki Jun-ichirō (1886–1965) is well known in America and Europe for *The Key, The Makioka Sisters,* and *Diary of a Mad Old Man.* His novels, all set in a modern, Westernized Japan, are assured of universal popularity because of their frank and lavish sexual content. Mishima Yukio (1925–70), who committed ceremonial suicide at the height of his reputation, was perhaps the most successful, and certainly the most prolific, of all modern Japanese novelists. Ten of his fictions had been filmed; he had won all the major Japanese literary awards and appeared to be destined for the Nobel Prize. His works are characterized by ruthless violence and a perversity that, however much it seems to derive from the pornographic excesses of Western fiction, is certainly in the Japanese tradition. His work is hard to judge, but he was the most considerable literary figure of the East.

Western influences

India and East Asia. The Indian novel is a branch of British Commonwealth literature. That is to say, it is practiced by writers who have received a British literary education and, for the most part, publish their books in London. There is no evidence of any great development of fiction in any of the native Indian tongues: a taste for reading novels, as opposed to seeing films or reading short stories in the Hindi or Punjabi press, is acquired in India along with an education in English, which is still the unifying tongue of the subcontinent. In Malaysia, where the same tradition holds, short stories are being written in Malay, Chinese, and Tamil, but the full-length novel is almost exclusively written in English. It is as much a matter of literary markets as of literary education. No novel in any of the tongues of the peninsula is likely to be a remunerative publishing proposition, as Han Suyin—a best-selling Chinese woman doctor from Johore, who found large fame with *A Many-Splendoured Thing*—would be the first to admit, for all her dislike of the British colonial tradition. Indonesia's abandonment of all vestiges of its Dutch colonial past is associated with the encouragement of a literature in Bahasa Indonesia, a variety of Malay, and there are a number of Indonesian novelists still looking for a large educated audience—inevitably in translation, in the West. Among these Mochtar Lubis is notable; his *Twilight in Djakarta* is a bitter indictment of the Sukarno regime, which promptly sent him to prison. This was not the kind of fiction that the new Indonesia had in mind.

Africa. What applies to India and the East Indies applies also to Africa: there is still an insufficiently large audience for fiction written in any of the major African languages, and African novelists brought up on English are only too happy to continue working in it. Other European languages—chiefly Afrikaans (a South African variety of Dutch) and French—are employed as a fictional medium. Arthur Fula, who wrote *Janie Giet die Beeld* (*Janie Casts the Image*), is an Afrikaans novelist whose reputation has not, as yet, stretched to Europe or America, but the novelists of the former French possessions are gaining a name among serious students of the African novel. Mongo Beti, from Cameroon, is known for his *Pauvre Christ de Bomba* and *Le Roi miraculé;* the Ivory Coast has Aké Loba, and Hamidou Kane represents Senegal. This new African French deserves to be regarded as a distinct literary language, unrelated to that of Paris or Quebec, but the critical and linguistic tools for appraising the fiction of French-speaking Africans are not yet available.

Latin America. One of the greatest contemporary writers of fiction, Jorge Luis Borges, is an Argentinian, but his *ficciones* are very short short stories and must, with regrets, be excluded from any survey of the novel. It is significant, however, that the circumstances for the creation of a great fictional literature are in existence in Latin America, signifying (unlike the case in many former British dependencies) a shedding of the old colonial provincialism, which relied on the opinion of Madrid or, in Brazil, of Lisbon. The first Latin American novel was probably *El periquillo sarniento* (1816; *The Itching Parrot*), by the Mexican José Joaquín Fernández de Lizardi (1776–1827), a picaresque work satirizing colonial conditions. In Argentina, José Mármol (1817–1871) published the first major novel of the continent—*Amalia* (1851–55), a powerful study of the fear and degradation that were rife in Buenos Aires during the dictatorship of the corrupt and tyrannical Juan Manuel de Rosas. The Romantic period in Europe had its counterpart in the sentimental wave that overtook such novelists as the Colombian Jorge Isaacs (1837–95), while the new humanitarianism found a voice in *Birds Without a Nest,* a protest-novel on the conditions forced on the Indians of Peru, written by Clorinda Matto de Turner (1854–1901). Juan León Mera followed the same trend in *Cumandá,* a novel about the oppression of the Ecuadorian Indians. As Latin America moved toward the modern age, the inevitable novels of urban social protest made their appearance. Alberto Blest Gana (1830–1920) of Chile, Carlos Reyles (1868–1938) of Uruguay, and Gustavo Martínez Zuviría of Argentina are names of some historical significance; and Reyles's naturalistic novel *La Raza de Caín* (*Cain's Race*) is original in that it finds a parallel between the breeding of stock and the building of a human society.

A 20th-century reaction against the bourgeois novel led to the movement known as nativism, with its concentration on the land itself, the lot of the indigenous peoples, the need for an anti-racist revolution with the aim of true egalitarianism. *Los de Abajo* (1915; *The Underdogs*), by the Mexican Mariano Azuela (1873–1952), and *El Señor Presidente* (1946), by Miguel Angel Asturias of Guatemala, typify the new revolutionary novel. Much of the didactic energy that went to the making of such work resulted in a lack of balance between subject matter and style: the literature of revolt tends to be shrill and crude. The inevitable reaction to a more sophisticated kind of literature, in which the individual became more important than society and the unconscious more interesting than the operation of reason, led to the highly refined experimentation that is the mark of Borges, the Brazilian Érico Veríssimo, and Eduardo Barrios of Chile.

Rise of nativism

The fiction of Brazil is in many ways more interesting than the fiction of the mother country, which has produced only one major novelist in the realist José Maria de Eça de Queirós (1845–1900). Gregório de Matos Guerra, as early as the 17th century, wrote bitterly of colonial administration and painted a realistic picture of Brazilian life. Irony and keen observation have been characteristic of the Brazilian novel ever since—as in the *Memórias Póstumas de Brás Cubas* (1881) and *Dom Casmurro* of

Joaquim Maria Machado de Assis (1839–1908); the *Canaã* (1902; *Canaan*) of José Pereira da Graça Aranha (1868–1931), a remarkable study of the disillusion of German settlers in a new land; and the *Os Sertões* (*Rebellion in the Backlands*) of Euclides da Cunha (1866–1909), an account of a revolt against the newly formed Brazilian republic. The social consciousness of Brazilian novelists is remarkable, especially when it is associated with a strong concern for stylistic economy and grace. Monteiro Lobato (1882–1948), with his rustic hero Jeca Tatú; José Lins do Rêgo (1901–1957), chronicler of the decay of the old plantation life; Jorge Amado, a socialist novelist much concerned with slum life in Bahia; Érico Veríssimo, an experimental writer grounded in the traditional virtues of credible plot and strong characterization—these attest a vigour hardly to be found in the fiction published in Lisbon.

SOCIAL AND ECONOMIC ASPECTS

Though publishers of fiction recognize certain obligations to art, even when these are unprofitable (as they usually are), they are impelled for the most part to regard the novel as a commercial property and to be better pleased with large sales of indifferent work than with the mere unremunerative acclaim of the intelligentsia for books of rare merit. For this reason, any novelist who seeks to practice his craft professionally must consult the claims of the market and effect a compromise between what he wishes to write and what the public will buy. Many worthy experimental novels, or novels more earnest than entertaining, gather dust in manuscript or are circulated privately in photocopies. Indeed, the difficulty that some unestablished novelists find in gaining a readership (which means the attention of a commercial publisher) has led them to take the copying machine as seriously as the printing press and to make the compostion, mimeographing, binding, and distribution of a novel into a single cottage industry. For the majority of novelists the financial rewards of their art are nugatory, and only a strong devotion to the form for its own sake can drive them to the building of an oeuvre. The subsidies provided by university sinecures sustain a fair number of major American novelists; others, in most countries, support their art by practicing various kinds of subliterature—journalism, film scripts, textbooks, even pseudonymous pornography. Few novelists write novels and novels only.

Awards, patronage, and ancillary activities

There are certain marginal windfalls, and the hope of gaining one of these tempers the average novelist's chronic desperation. America has its National Book Award as well as its book club choices; France has a great variety of prizes; there are also international bestowals; above all there glows the rarest and richest of all accolades—the Nobel Prize for Literature. Quite often the Nobel Prize winner needs the money as much as the fame, and his election to the honour is not necessarily a reflection of a universal esteem which, even for geniuses like Samuel Beckett, means large sales and rich royalties. When Sinclair Lewis received the award in 1930, wealth and fame were added to wealth and fame already sufficiently large; when William Faulkner was chosen in 1949, most of his novels had been long out of print in America.

Prizes come so rarely, and often seem to be bestowed so capriciously, that few novelists build major hopes on them. They build even fewer hopes on patronage: Harriet Shaw Weaver, James Joyce's patroness, was probably the last of a breed that, from Maecenas on, once intermittently flourished; state patronage—as represented, for instance, by the annual awards of the Arts Council of Great Britain—can provide little more than a temporary palliative for the novelist's indigence. Novelists have more reasonable hopes from the world of the film or the stage, where adaptations can be profitable and even salvatory. The long struggles of the British novelist T.H. White came to an end when his Arthurian sequence *The Once and Future King* (1958) was translated into a stage musical called *Camelot*, though, by treating the lump sum paid to him as a single year's income instead of a reward for decades of struggle, nearly all the windfall would have gone for taxes if White had not taken his money into low-tax exile. Such writers as Graham Greene, nearly all of whose novels have been filmed, must be tempted to regard mere book sales as an inconsiderable aspect of the rewards of creative writing. There are few novelists who have not received welcome and unexpected advances on film options, and sometimes the hope of film adaptation has influenced the novelist's style. In certain countries, such as Great Britain but not the United States, television adaptation of published fiction is common, though it pays the author less well than commercial cinema.

When a novelist becomes involved in film-script writing—either the adaptation of his own work or that of others—the tendency is for him to become subtly corrupted by what seems to him an easier as well as more lucrative technique than that of the novel. Most novelists write dialogue with ease, and their contribution to a film is mostly dialogue: the real problem in novel writing lies in the management of the *récit*. A number of potentially fine novelists, like Terry Southern and Frederick Raphael, have virtually abandoned the literary craft because of their continued success with script writing. In 70-odd years the British novelist Richard Hughes produced only three novels, the excellence of which has been universally recognized; fiction lovers have been deprived of more because of the claims of the film world on Hughes's talent. This kind of situation finds no counterpart in any other period of literary history, except perhaps in the Elizabethan, when the commercial lure of the drama made some good poets write poor plays.

The majority of professional novelists must look primarily to book sales for their income, and they must look decreasingly to hardcover sales. The novel in its traditional format, firmly stitched and sturdily clothbound, is bought either by libraries or by readers who take fiction seriously enough to wish to acquire a novel as soon as it appears: if they wait 12 months or so, they can buy the novel in paper covers for less than its original price. This edition of a novel has become, for the vast majority of fiction readers, the form in which they first meet it, and the novelist who does not achieve paperback publication is missing a vast potential audience. He may not repine at this, since the quantitative approach to literary communication may safely be disregarded: the legend on a paperback cover—FIVE MILLION COPIES SOLD—says nothing about the worth of the book within. Nevertheless, the advance he will receive from his hardcover publisher is geared to eventual paperback expectations, and the "package deal" has become the rule in negotiations between publisher and author's agent. The agent, incidentally, has become important to both publisher and author to an extent that writers like Daniel Defoe and Samuel Richardson would, if resurrected, find hard to understand.

The importance of the paperback

The novelist may reasonably expect to augment his income through the sale of foreign rights in his work, though the rewards accruing from translation are always uncertain. The translator himself is usually a professional and demands a reasonable reward for his labours, more indeed than the original author may expect: the reputations of some translators are higher than those of some authors, and even the translators' names may be better known. Moreover, the author who earns most from publication in his own language will usually earn most in translation, since it is the high initial home sales that attract foreign publishers to a book. The more "literary" a novel is, the more it exploits the resources of the author's own language, the less likely is it to achieve either popularity at home or publication abroad. Best-selling novels like Mario Puzo's *Godfather* (1969) or Arthur Hailey's *Airport* (1968) are easy to read and easy to translate, so they win all around. It occasionally happens that an author is more popular abroad than he is at home: the best-selling novels of the Scottish physician-novelist A.J. Cronin are no longer highly regarded in England and America, as they were in the 1930s and '40s, but they continued to sell by the million in the U.S.S.R. several decades later. However, a novelist is wisest to expect most from his own country and to regard foreign popularity as an inexplicable bonus.

Problems of obscenity and libel

As though his financial problems were not enough, the novelist frequently has to encounter those dragons unleashed by public morality or by the law. The struggles

of Flaubert, Zola, and Joyce, denounced for attempting to advance the frontiers of literary candour, are well known and still vicariously painful, but lesser novelists, working in a more permissive age, can record cognate agonies. Generally speaking, any novelist writing after the publication in the 1960s of Hubert Selby's *Last Exit to Brooklyn* or Gore Vidal's *Myra Breckenridge* can expect little objection, on the part of either publisher or police, to language or subject matter totally unacceptable, under the obscenity laws then operating, in 1922, when *Ulysses* was first published. This is certainly true of America, if not of Ireland or Malta. But many serious novelists fear an eventual reaction against literary permissiveness as a result of the exploitation by cynical obscenity mongers or hard-core pornographers of the existing liberal situation.

In some countries, particularly Great Britain, the law of libel presents insuperable problems to novelists who, innocent of libellous intent, are nevertheless sometimes charged with defamation by persons who claim to be the models for characters in works of fiction. Disclaimers to the effect that "resemblances to real-life people are wholly coincidental" have no validity in law, which upholds the right of a plaintiff to base his charge on the corroboration of "reasonable people." Many such libel cases are settled before they come to trial, and publishers will, for the sake of peace and in the interests of economy, make a cash payment to the plaintiff without considering the author's side. They will also, and herein lies the serious blow to the author, withdraw copies of the allegedly offensive book and pulp the balance of a whole edition. Novelists are seriously hampered in their endeavours to show, in a traditional spirit of artistic honesty, corruption in public life; they have to tread carefully even in depicting purely imaginary characters and situations, since the chance collocation of a name, a profession, and a locality may produce a libellous situation.

EVALUATION AND STUDY

It has been only in comparatively recent times that the novel has been taken sufficiently seriously by critics for the generation of aesthetic appraisal and the formulation of fictional theories. The first critics of the novel developed their craft not in full-length books but in reviews published in periodicals: much of this writing—in the late 18th and early 19th centuries—was of an occasional nature, and not a little of it casual and desultory; nor, at first, did critics of fiction find it easy to separate a kind of moral judgment of the subject matter from an aesthetic judgement of the style. Such fragmentary observations on the novel as those made by Dr. Johnson in conversation or by Jane Austen in her letters, or, in France, by Gustave Flaubert during the actual process of artistic gestation, have the charm and freshness of insight rather than the weight of true aesthetic judgment. It is perhaps not until the beginning of the 20th century, when Henry James wrote his authoritative prefaces to his own collected novels, that a true criteriology of fiction can be said to have come into existence. The academic study of the novel presupposes some general body of theory, like that provided by Percy Lubbock's *Craft of Fiction* (1921) or E.M. Forster's *Aspects of the Novel* (1927) or the subsequent writings of the critics Edmund Wilson and F.R. Leavis. Since World War II it may be said that university courses in the evaluation of fiction have attained the dignity traditionally monopolized by poetry and the drama.

The distinction between reviewing and criticism

A clear line should be drawn between the craft of fiction criticism and the journeyman work of fiction reviewing. Reviews are mainly intended to provide immediate information about new novels: they are done quickly and are subject to the limitations of space; they not infrequently make hasty judgments that are later regretted. The qualifications sought in a reviewer are not formidable: smartness, panache, waspishness—qualities that often draw the attention of the reader to the personality of the reviewer rather than the work under review—will always be more attractive to circulation-hunting editors than a less spectacular concern with balanced judgment. A thoughtful editor will sometimes put the reviewing of novels into the hands of a practicing novelist, who—knowing the labour that goes into even the meanest book—will be inclined to sympathy more than to flamboyant condemnation. The best critics of fiction are probably novelists *manqués*, men who have attempted the art and, if not exactly failed, not succeeded as well as they could have wished. Novelists who achieve very large success are possibly not to be trusted as critics: obsessed by their own individual aims and attainments, shorn of self-doubt by the literary world's acclaim or their royalty statements, they bring to other men's novels a kind of magisterial blindness.

Novelists can be elated by good reviews and depressed by bad ones, but it is rare that a novelist's practice is much affected by what he reads about himself in the literary columns. Genuine criticism is a very different matter, and a writer's approach to his art can be radically modified by the arguments and summations of a critic he respects or fears. As the hen is unable to judge of the quality of the egg it lays, so the novelist is rarely able to explain or evaluate his work. He relies on the professional critic for the elucidation of the patterns in his novels, for an account of their subliminal symbolism, for a reasoned exposition of their stylistic faults. As for the novel reader, he will often learn enthusiasm for particular novelists through the writings of critics rather than from direct confrontation with the novels themselves. The essays in Edmund Wilson's *Axel's Castle* (1931) aroused an interest in the Symbolist movement which the movement was not easily able to arouse by itself; the essay on *Finnegans Wake*, collected in Wilson's *Wound and the Bow* (1941), eased the way into a very difficult book in a manner that no grim work of solid exegesis could have achieved. The essence of the finest criticism derives from wisdom and humanity more than from mere expert knowledge. Great literature and great criticism possess in common a sort of penumbra of wide but unsystematic learning, a devotion to civilized values, an awareness of tradition, and a willingness to rely occasionally on the irrational and intuitive.

All this probably means that the criticism of fiction can never, despite the efforts of aestheticians schooled in modern linguistics, become an exact science. A novel must be evaluated in terms of a firmly held literary philosophy, but such a philosophy is, in the final analysis, based on the irrational and subjective. If the major premises on which F.R. Leavis bases his judgments of George Eliot, Mark Twain, and D.H. Lawrence are accepted, then an acceptance of the judgments themselves is inescapable. But many students of fiction who are skeptical of Leavis will read him in order that judgments of their own may emerge out of a purely negative rejection of his. In reading criticism a kind of dialectic is involved, but no synthesis is ever final. The process of revaluation goes on for ever. One of the sure tests of a novel's worth is its capacity for engendering critical dialectic: no novel is beyond criticism, but many are beneath it.

THE FUTURE OF THE NOVEL

It is apparent that neither law nor public morality nor the public's neglect nor the critic's scorn has ever seriously deflected the dedicated novelist from his self-imposed task of interpreting the real world or inventing alternative worlds. Statistics since World War II have shown a steady increase in the number of novels published annually, and beneath the iceberg tip of published fiction lies a submarine Everest of unpublished work. It has been said that every person has at least one novel in him, and the near-universal literacy of the West has produced dreams of authorship in social ranks traditionally deprived of literature. Some of these dreams come true, and taxi drivers, pugilists, criminals, and film stars have competed, often successfully, in a field that once belonged to professional writers alone. It is significant that the amateur who dreams of literary success almost invariably chooses the novel, not the poem, essay, or autobiography. Fiction requires no special training and can be readable, even absorbing, when it breaks the most elementary rules of style. It tolerates a literary incompetence unthinkable in the poem. If all professional novelists withdrew, the form would not languish: amateurs would fill the market with first and only novels, all of which would find readership.

Amateur novelists

But the future of any art lies with its professionals. Here a distinction has to be made between the Joyces, Henry Jameses, and Conrads on the one hand, and the more ephemeral Mickey Spillanes, Harold Robbinses, and Irving Wallaces on the other. Of the skill of the latter class of novelists there can be no doubt, but it is a skill employed for limited ends, chiefly the making of money, and through it the novel can never advance as art. The literary professionals, however, are dedicated to the discovery of new means of expressing, through the experiential immediacies that are the very stuff of fiction, the nature of man and society. In the symbiosis of publishing, the best-seller will probably continue to finance genuine fictional art. Despite the competition from other art media, and the agonies and the indigence, there are indications that the serious novel will flourish in the future.

It will flourish because it is the one literary form capable of absorbing all the others. The technique of the stage drama or the film can be employed in the novel (as in *Ulysses* and *Giles Goat-Boy*), as can the devices of poetry (as in Philip Toynbee's *Pantaloon* and the novels of Wilson Harris and Janet Frame). In France, as Michel Butor has pointed out, the new novel is increasingly performing some of the tasks of the old essay; in America, as Capote's *In Cold Blood* and Mailer's *Armies of the Night* have shown, the documentary report can gain strength from its presentation as fictional narrative. There are few limits on what the novel can do, there are many experimental paths still to be trod, and there is never any shortage of subject matter.

For all this, periods of decline and inanition may be expected, though not everywhere at once. The strength of the American novel in the period after World War II had something to do with the national atmosphere of breakdown and change: political and social urgencies promoted a quality of urgency in the works of such writers as Mailer, Bellow, Ellison, Heller, and Philip Roth. In the same period, Britain, having shed its empire and erected a welfare state, robbed its novelists of anything larger to write about than temporary indentations in the class system, suburban adultery, and manners. An achieved or static society does not easily produce great art. France, which has known much social and ideological turmoil, has generated a new aesthetic of the novel as well as a philosophy that, as Sartre and Camus have shown, is very suitable for fictional expression. A state on which intellectual quietism or a political philosophy of art is imposed by the ruling party can, as the Soviet Union and China show, succeed only in thwarting literary greatness, but the examples of Pasternak and Solzhenitsyn are reminders that repression can, with rare artistic spirits, act as an agonizing stimulus.

Every art in every country is subject to a cyclical process: during a period of decline it is necessary to keep the communication lines open, producing minor art so that it may some day, unexpectedly, turn into major art. Wherever the novel seems to be dying it is probably settling into sleep; elsewhere it will be alive and vigorous enough. It is important to believe that the novel has a future, though not everywhere at once. (An.B.)

Short story

The short story is a kind of prose fiction, usually more compact and intense than the novel and the short novel (novelette). Prior to the 19th century it was not generally regarded as a distinct literary form. But although in this sense it may seem to be a uniquely modern genre, the fact is that short prose fiction is nearly as old as language itself. Throughout history man has enjoyed various types of brief narratives: jests, anecdotes, studied digressions, short allegorical romances, moralizing fairy tales, short myths, and abbreviated historical legends. None of these constitutes a short story as the 19th and 20th centuries have defined the term, but they do make up a large part of the milieu from which the modern short story emerged.

Many of the elements of storytelling common to the short story and the novel are discussed at greater length in the preceding section on the novel. The short stories of particular literary cultures, along with other genres, are discussed in articles such as LITERATURE, THE HISTORY OF WESTERN; and in articles on the arts of various peoples—*e.g.*, SOUTH ASIAN ARTS.

ANALYSIS OF THE GENRE

As a genre, the short story has received relatively little critical attention, and the most valuable studies of the form that exist are often limited by region or era (*e.g.*, Ray B. West's *The Short Story in America*, 1900–50). One recent attempt to account for the genre has been offered by the Irish short story writer Frank O'Connor, who suggests that stories are a means for "submerged population groups" to address a dominating community. Most other theoretical discussions, however, are predicated in one way or another on Edgar Allan Poe's thesis that stories must have a compact, unified effect.

By far the majority of criticism on the short story focusses on techniques of writing. Many, and often the best of the technical works, advise the young reader—alerting him to the variety of devices and tactics employed by the skilled writer. On the other hand, many of these works are no more than treatises on "how to write stories" for the young writer, and not serious critical material.

The prevalence in the 19th century of two words, "sketch" and "tale," affords one way of looking at the genre. In the United States alone there were virtually hundreds of books claiming to be collections of sketches (Washington Irving's *Sketch Book*, William Dean Howells' *Suburban Sketches*) or collections of tales (Poe's *Tales of the Grotesque and Arabesque*, Herman Melville's *Piazza Tales*). These two terms establish the polarities of the milieu out of which the modern short story grew.

The sketch and the tale

The tale is much older than the sketch. Basically, the tale is a manifestation of a culture's unaging desire to name and conceptualize its place in the cosmos. It provides a culture's narrative framework for such things as its vision of itself and its homeland or for expressing its conception of its ancestors and its gods. Usually filled with cryptic and uniquely deployed motifs, personages, and symbols, tales are frequently fully understood only by members of the particular culture to which they belong. Simply, tales are intracultural. Seldom created to address an outside culture, a tale is a medium through which a culture speaks to itself and thus perpetuates its own values and stabilizes its own identity. The old speak to the young through tales.

The sketch, by contrast, is intercultural, depicting some phenomenon of one culture for the benefit or pleasure of a second culture. Factual and journalistic, in essence the sketch is generally more analytic or descriptive and less narrative or dramatic than the tale. Moreover, the sketch by nature is *suggestive*, incomplete; the tale is often *hyperbolic*, overstated.

The primary mode of the sketch is written: that of the tale, spoken. This difference alone accounts for their strikingly different effects. The sketch writer can have, or pretend to have, his eye on his subject. The tale, recounted at court or campfire—or at some place similarly removed in time from the event—is nearly always a recreation of the past. The tale-teller is an agent of *time*, bringing together a culture's past and its present. The sketch writer is more an agent of *space*, bringing an aspect of one culture to the attention of a second.

It is only a slight oversimplification to suggest that the tale was the only kind of short fiction until the 16th century, when a rising middle class interest in social realism on the one hand and in exotic lands on the other put a premium on sketches of subcultures and foreign regions. In the 19th century certain writers—those one might call the "fathers" of the modern story: Nikolay Gogol, Hawthorne, E.T.A. Hoffmann, Heinrich von Kleist, Prosper Mérimée, Poe—combined elements of the tale with elements of the sketch. Each writer worked in his own way, but the general effect was to mitigate some of the fantasy and stultifying conventionality of the tale and, at the same time, to liberate the sketch from its bondage to strict factuality. The modern short story, then, ranges between the highly imaginative tale and the photographic sketch and in some ways draws on both.

Modern fusions

The short stories of Ernest Hemingway, for example,

may often gain their force from an exploitation of traditional mythic symbols (water, fish, groin wounds), but they are more closely related to the sketch than to the tale. Indeed, Hemingway was able at times to submit his apparently factual stories as newspaper copy. In contrast, the stories of Hemingway's contemporary William Faulkner more closely resemble the tale. Faulkner seldom seems to understate, and his stories carry a heavy flavour of the past. Both his language and his subject matter are rich in traditional material. A Southerner might well suspect that only a reader steeped in sympathetic knowledge of the traditional South could fully understand Faulkner. Faulkner may seem, at times, to be a Southerner speaking to and for Southerners. But, as, by virtue of their imaginative and symbolic qualities, Hemingway's narratives are more than journalistic sketches, so, by virtue of their explorative and analytic qualities, Faulkner's narratives are more than Southern tales.

Whether or not one sees the modern short story as a fusion of sketch and tale, it is hardly disputable that today the short story is a distinct and autonomous, though still developing, genre.

HISTORY

Origins. The evolution of the short story first began before man could write. To aid himself in constructing and memorizing tales, the early storyteller often relied on stock phrases, fixed rhythms, and rhyme. Consequently, many of the oldest narratives in the world, such as the famous Babylonian tale the *Epic of Gilgamesh* (*c.* 2000 BC), are in verse. Indeed, most major stories from the ancient Middle East were in verse: "The War of the Gods," "The Story of Adapa" (both Babylonian), "The Heavenly Bow," and "The King Who Forgot" (both Canaanite). These tales were inscribed in cuneiform on clay during the 2nd millennium BC.

The earliest tales extant

The earliest tales extant from Egypt were composed on papyrus at a comparable date. The ancient Egyptians seem to have written their narratives largely in prose, apparently reserving verse for their religious hymns and working songs. One of the earliest surviving Egyptian tales, "The Shipwrecked Sailor" (*c.* 2000 BC), is clearly intended to be a consoling and inspiring story to reassure its aristocratic audience that apparent misfortune can in the end become good fortune. Also recorded during the 12th dynasty were the success story of the exile Sinuhe and the moralizing tale called "King Cheops [Khufu] and the Magicians." The provocative and profusely detailed story "The Tale of Two Brothers" (or "Anpu and Bata") was written down during the New Kingdom, probably around 1250 BC. Of all the early Egyptian tales, most of which are baldly didactic, this story is perhaps the richest in folk motifs and the most intricate in plot.

The earliest tales from India are not as old as those from Egypt and the Middle East. The *Brāhmaṇas* (*c.* 700 BC) function mostly as theological appendixes to the Four Vedas, but a few are composed as short, instructional parables. Perhaps more interesting as stories are the later tales in the Pāli language, *The Jātaka*. Although these tales have a religious frame that attempts to recast them as Buddhist ethical teachings, their actual concern is generally with secular behaviour and practical wisdom. Another, nearly contemporaneous collection of Indian tales, *The Pañca-tantra* (*c.* AD 500), has been one of the world's most popular books. This anthology of amusing and moralistic animal tales, akin to those of "Aesop" in Greece, was translated into Middle Persian in the 6th century; into Arabic in the 8th century; and into Hebrew, Greek, and Latin soon thereafter. Sir Thomas North's English translation appeared in 1570. Another noteworthy collection is *Kathā-saritsāqara* ("Ocean of Rivers of Stories), a series of tales assembled and recounted in narrative verse in the 11th century by the Sanskrit writer Samadeva. Most of these tales come from much older material, and they vary from the fantastic story of a transformed swan to a more probable tale of a loyal but misunderstood servant.

During the 2nd, 3rd, and 4th centuries BC, the Hebrews first wrote down some of their rather sophisticated narratives, which are now a part of the Old Testament and the Apocrypha. The book of Tobit displays an unprecedented sense of ironic humour; Judith creates an unrelenting and suspenseful tension as it builds to its bloody climax; the story of Susanna, the most compact and least fantastic in the Apocrypha, develops a three-sided conflict involving the innocent beauty of Susanna, the lechery of the elders, and the triumphant wisdom of Daniel. The Old Testament books of Ruth, Esther, and Jonah hardly need mentioning: they may well be the most famous stories in the world.

The didacticism of early tales

Nearly all of the ancient tales, whether from Israel, India, Egypt, or the Middle East, were fundamentally didactic. Some of these ancient stories preached by presenting an ideal for readers to imitate. Others tagged with a "moral" were more direct. Most stories, however, preached by illustrating the success and joy that was available to the "good" man and by conveying a sense of the terror and misery that was in store for the wayward.

The early Greeks contributed greatly to the scope and art of short fiction. As in India, the moralizing animal fable was a common form; many of these tales were collected as "Aesop's fables" in the 6th century BC. Brief mythological stories of the gods' adventures in love and war were also popular in the pre-Attic age. Apollodorus of Athens compiled a handbook of epitomes, or abstracts, of these tales around the 2nd century BC, but the tales themselves are no longer extant in their original form. They appear, though somewhat transformed, in the longer poetical works of Hesiod, Homer, and the tragedians. Short tales found their way into long prose forms as well, as in Hellanicus' *Persika* (5th century BC, extant only in fragments).

Herodotus, the "father of history," saw himself as a maker and reciter of *logoi* (things for telling, tales). His long *History* is interspersed with such fictionalized digressions as the stories of Polycrates and his emerald ring, of Candaules' attractive wife, and of Rhampsinitus' stolen treasure. Xenophon's philosophical history, the *Cyropaedia* (4th century BC), contains the famous story of the soldier Abradates and his lovely and loyal wife Panthea, perhaps the first Western love story. The *Cyropaedia* also contains other narrative interpolations: the story of Pheraules, who freely gave away his wealth; the tale of Gobryas' murdered son; and various anecdotes describing the life of the Persian soldier.

Beginnings of the romance

Moreover, the Greeks are usually credited with originating the romance, a long form of prose fiction with stylized plots of love, catastrophe, and reunion. The early Greek romances frequently took shape as a series of short tales. The *Love Romances* of Parthenius of Nicaea, who wrote during the reign of Augustus Caesar, is a collection of 36 prose stories of unhappy lovers. *The Milesian Tales* (no longer extant) was an extremely popular collection of erotic and ribald stories composed by Aristides of Miletus in the 2nd century BC and translated almost immediately into Latin. As the variety of these short narratives suggests, the Greeks were less insistent than earlier cultures that short fiction be predominantly didactic.

By comparison the contribution of the Romans to short narrative was small. Ovid's long poem, *Metamorphoses,* is basically a reshaping of over 100 short, popular tales into a thematic pattern. The other major fictional narratives to come out of Rome are novel-length works by Petronius (*Satyricon,* 1st century AD) and Apuleius (*The Golden Ass,* 2nd century AD). Like Ovid these men used potential short-story material as episodes within a larger whole. The Roman love of rhetoric, it seems, encouraged the development of longer and more comprehensive forms of expression. Regardless, the trend away from didacticism inaugurated by the Greeks was not reversed.

Middle Ages, Renaissance, and after. *Proliferation of forms.* The Middle Ages was a time of the proliferation, though not necessarily the refinement, of short narratives. The short tale became an important means of diversion and amusement. From the Dark Ages to the Renaissance, various cultures adopted short fiction for their own purposes. Even the aggressive, grim spirit of the invading Germanic barbarians was amenable to expression in short prose. The myths and sagas extant in Scandinavia and Iceland indicate the kinds of bleak and violent tales the invaders took with them into southern Europe.

In contrast, the romantic imagination and high spirits of the Celts remained manifest in their tales. Wherever they appeared—in Ireland, Wales, or Brittany—stories steeped in magic and splendour also appeared. This spirit, easily recognized in such Irish mythological tales as *Longes mac n-Uislenn* (probably 9th-century), infused the chivalric romances that developed somewhat later on the Continent. The romances usually addressed one of three "Matters": the "Matter of Britain" (stories of King Arthur and his knights), the "Matter of France" (the Charlemagne cycle), or the "Matter of Rome" (stories out of antiquity, such as "Pyramus and Thisbe," "Paris and Helen"). Many, but not all, of the romances are too long to be considered short stories. Two of the most influential contributors of short material to the "Matter of Britain" in the 12th century were Chrétien de Troyes and Marie de France. The latter was gifted as a creator of the short narrative poems known as the Breton lays. Only occasionally did a popular short romance like *Aucassin and Nicolette* (13th century) fail to address any of the three Matters.

Exempla and fabliaux

Also widely respected was the exemplum, a short didactic tale usually intended to dramatize or otherwise inspire model behaviour. Of all the exempla, the best known in the 11th and 12th centuries were the lives of the saints, some 200 of which are extant. The *Gesta Romanorum* ("Deeds of the Romans") offered skeletal plots of exempla that preachers could expand into moralistic stories for use in their sermons.

Among the common people of the late Middle Ages there appeared a literary movement counter to that of the romance and exemplum. Displaying a preference for common sense, secular humour, and sensuality, this movement accounted in a large way for the practical-minded animals in beast fables, the coarse and "merry" jestbooks, and the ribald fabliaux. All were important as short narratives, but perhaps the most intriguing of the three are the fabliaux. First appearing around the middle of the 12th century, fabliaux remained popular for 200 years, attracting the attention of Boccaccio and Chaucer. Some 160 fabliaux are extant, all in verse.

The framing circumstance

Often, the medieval storyteller—regardless of the kind of tale he preferred—relied on a framing circumstance that made possible the juxtaposition of several stories, each of them relatively autonomous. Since there was little emphasis on organic unity, most storytellers preferred a flexible format, one that allowed tales to be added or removed at random with little change in effect. Such a format is found in *The Seven Sages of Rome*, a collection of stories so popular that nearly every European country had its own translation. The framing circumstance in *The Seven Sages* involves a prince condemned to death; his advocates (the seven sages) relate a new story each day, thereby delaying the execution until his innocence is made known. This technique is clearly similar to that of *The Arabian Nights*, another collection to come out of the Middle Ages. The majority of the stories in *The Arabian Nights* are framed by the story of Scheherazade in "A Thousand and One Nights." Records indicate that the basis of this framing story was a medieval Persian collection, *Hezar Efsan* ("Thousand Romances," no longer extant). In both the Persian and Arabian versions of the frame, the clever Scheherazade avoids death by telling her king-husband a thousand stories. Though the framing device is identical in both versions, the original Persian stories within the frame were replaced or drastically altered as the collection was adapted by the Arabs during the Muslim Manlūk period (AD 1250–1517).

Boccaccio and Chaucer

Refinement. Short narrative received its most refined treatment in the Middle Ages from Chaucer and Boccaccio. Chaucer's versatility reflects the versatility of the age. In "The Miller's Tale" he artistically combines two fabliaux; in "The Nun's Priest's Tale" he draws upon material common to beast fables; in "The Pardoner's Tale" he creates a brilliantly revealing sermon, complete with a narrative exemplum. This short list hardly exhausts the catalogue of forms Chaucer experimented with. By relating tale to teller and by exploiting relationships among the various tellers, Chaucer endowed *The Canterbury Tales* with a unique, dramatic vitality.

Boccaccio's genius, geared more toward *narrative* than *drama*, is of a different sort. Where Chaucer reveals a character through actions and assertions, Boccaccio seems more interested in stories as pieces of action. With Boccaccio, the characters telling the stories, and usually the characters within, are of subordinate interest. Like Chaucer, Boccaccio frames his well-wrought tales in a metaphoric context. The trip to the shrine at Canterbury provides a meaningful backdrop against which Chaucer juxtaposes his earthy and pious characters. The frame of the *Decameron* (from the Greek *deka*, 10, and *hēmera*, day) has relevance as well: during the height of the Black Plague in Florence, Italy, 10 people meet and agree to amuse and divert each other by telling 10 stories each. Behind every story, in effect, is the inescapable presence of the Black Death. The *Decameron* is fashioned out of a variety of sources, including fabliaux, exempla, and short romances.

Spreading popularity. Immediately popular, the *Decameron* produced imitations nearly everywhere. In Italy alone, there appeared at least 50 writers of *novelle* (as short narratives were called) after Boccaccio.

Italian short narratives

Learning from the success and artistry of Boccaccio and, to a lesser degree, his contemporary Franco Sacchetti, Italian writers for three centuries kept the Western world supplied with short narratives. Sacchetti was no mere imitator of Boccaccio. More of a frank and unadorned realist, he wrote—or planned to write—300 stories (200 of the *Trecentonovelle* ["300 Short Stories"] are extant) dealing in a rather anecdotal way with ordinary Florentine life. Two other well-known narrative writers of the 14th century, Giovanni Fiorentino and Giovanni Sercambi, freely acknowledged their imitation of Boccaccio. In the 15th century Masuccio Salernitano's collection of 50 stories, *Il novellino* (1475), attracted much attention. Though verbosity often substitutes for eloquence in Masuccio's stories, they are witty and lively tales of lovers and clerics.

With Masuccio the popularity of short stories was just beginning to spread. Almost every Italian in the 16th century, it has been suggested, tried his hand at *novelle*. Matteo Bandello, the most influential and prolific writer, attempted nearly everything from brief histories and anecdotes to short romances, but he was most interested in tales of deception. Various other kinds of stories appeared. Agnolo Firenzuolo's popular *Ragionamenti diamore* ("The Reasoning of Love") is characterized by a graceful style unique in tales of ribaldry; Anton Francesco Doni included several tales of surprise and irony in his miscellany, *I marmi* ("The Marbles"); and Gianfrancesco Straparola experimented with common folktales and with dialects in his collection, *Le piacevoli notti* ("The Pleasant Nights"). In the early 17th century, Giambattista Basile attempted to infuse stock situations (often of the fairy-tale type, such as "Puss and Boots") with realistic details. The result was often remarkable—a tale of hags or princes with very real motives and feelings. Perhaps it is the amusing and diverting nature of Basile's collection of 50 stories that has reminded readers of Boccaccio. Or, it may be his use of a frame similar to that in the *Decameron*. Whatever the reason, Basile's *Cunto de li cunti* (1634; *The Story of Stories*) is traditionally linked with Boccaccio and referred to as *The Pentamerone* ("The Five Days"). Basile's similarities to Boccaccio suggest that in the 300 years between them the short story may have gained repute and circulation, but its basic shape and effect hardly changed.

This pattern was repeated in France, though the impetus provided by Boccaccio was not felt until the 15th century. A collection of 100 racy anecdotes, *Les Cent Nouvelles Nouvelles*, "The Hundred New Short Stories" (*c.* 1460), outwardly resembles the *Decameron*. Margaret of Angoulême's *Heptaméron* (1558–59; "The Seven Days"), an unfinished collection of 72 amorous tales, admits a similar indebtedness.

In the early 17th century Béroalde de Verville placed his own Rabelaisian tales within a banquet frame in a collection called *Le Moyen de parvenir*, "The Way of Succeeding" (*c.* 1610). Showing great narrative skill, Béroalde's stories are still very much in the tradition of Boccaccio; as a collection of framed stories, their main intent is to amuse and divert the reader.

As the most influential nation in Europe in the 15th and 16th centuries, Spain contributed to the proliferation of short prose fiction. Especially noteworthy are: Don Juan Manuel's collection of lively exempla *Libro de los enxiemplos del conde Lucanor et de Patronio* (1328–35), which antedates the *Decameron;* the anonymous story "The Abencerraje," which was interpolated into a pastoral novel of 1559; and, most importantly, Miguel de Cervantes' experimental *Novelas ejemplares* (1613; "Exemplary Novels"). Cervantes' short fictions vary in style and seriousness, but their single concern is clear: to explore the nature of man's secular existence. This focus was somewhat new for short fiction, heretofore either didactic or escapist.

A new concern

Despite the presence of these and other popular collections, short narrative in Spain was eventually overshadowed by a new form that began to emerge in the 16th century—the novel. Like the earlier Romans, the Spanish writers of the early Renaissance often incorporated short story material as episodes in a larger whole.

Decline of short fiction. The 17th and 18th centuries mark the temporary decline of short fiction. The causes of this phenomenon are many: the emergence of the novel; the failure of the Boccaccio tradition to produce in three centuries much more than variations or imitations of older, well-worn material; and a renaissant fascination with drama and poetry, the superior forms of classical antiquity. Another cause for the disappearance of major works of short fiction is suggested by the growing preference for journalistic sketches. The increasing awareness of other lands and the growing interest in social conditions (accommodated by a publication boom) produced a plethora of descriptive and biographical sketches. Although these journalistic elements later were incorporated in the fictional short story, for the time being fact held sway over the imagination. Travel books, criminal biographies, social description, sermons, and essays occupied the market. Only occasionally did a serious story find its way into print, and then it was usually a production of an established writer like Voltaire or Addison.

Perhaps the decline is clearest in England, where the short story had its least secure foothold. It took little to obscure the faint tradition established in the 16th and 17th centuries by the popular jestbooks, by the *Palace of Pleasure* (an anthology of stories, mostly European), and by the few rough stories written by Englishmen (*e.g.,* Barnabe Rich's *Farewell to Military Profession,* 1581).

During the Middle Ages short fiction had become primarily an amusing and diverting medium. The Renaissance and Enlightenment, however, made different demands of the form. The awakening concern with secular issues called for a new attention to actual conditions. Simply, the diverting stories were no longer relevant or viable. At first only the journalists and pamphleteers responded to the new demand. Short fiction disappeared, in effect, because it did not respond. When it did shake off its escapist trappings in the 19th century, it reappeared as the "modern short story." This was a new stage in the evolution of short fiction, one in which the short form undertook a new seriousness and gained a new vitality and respect.

Emergence of the modern short story. *The 19th century.* The modern short story emerged almost simultaneously in Germany, the United States, France, and Russia. In Germany there had been relatively little difference between the stories of the late 18th century and those in the older tradition of Boccaccio. In 1795 Goethe contributed a set of stories to Schiller's journal, *Die Horen,* that were obviously created with the *Decameron* in mind. Significantly, Goethe did not call them "short stories" (*Novellen*) although the term was available to him. Rather, he thought of them as "entertainments" for German travellers (*Unterhaltungen deutscher Ausgewanderten*). Friedrich Schlegel's early discussion of the short narrative form, appearing soon after Goethe's "entertainments," also focussed on Boccaccio (*Nachrichten von den poetischen Werken des G. Boccaccio,* 1801).

A new type of short fiction

But a new type of short fiction was near at hand—a type that accepted some of the realistic properties of popular journalism. In 1827, 32 years after publishing his own "entertainments," Goethe commented on the difference between the newly emergent story and the older kind. "What is a short story," he asked, "but an event which, though unheard of, has occurred? Many a work which passes in Germany under the title 'short story' is not a short story at all, but merely a tale or what else you would like to call it." Two influential critics, Christoph Wieland and Friedrich Schleiermacher, also argued that a short story properly concerned itself with events that actually happened or could happen. A short story, for them, had to be realistic.

Perhaps sensitive to this qualification, Heinrich von Kleist and E.T.A. Hoffmann called their short works on fabulous themes "tales" (*Erzählungen*). Somewhat like Poe, Kleist created an expression of human problems, partly metaphysical and partly psychological, by dramatizing man's confrontations with a fantastic, chaotic world. Hoffmann's intriguing tales of exotic places and of supernatural phenomena were very likely his most influential. Another important writer, Ludwig Tieck, explicitly rejected realism as the definitive element in a short story. As he noted in his preface to the 1829 collection of his works and as he demonstrated in his stories, Tieck envisioned the short story as primarily a matter of intensity and ironic inversion. A story did not have to be realistic in any outward sense, he claimed, so long as the chain of consequences was "entirely in keeping with character and circumstances." By allowing the writer to pursue an inner, and perhaps bizarre, reality and order, Tieck and the others kept the modern story open to nonjournalistic techniques.

In the United States, the short story, as in Germany, evolved in two strains. On the one hand there appeared the realistic story that sought objectively to deal with seemingly real places, events, or persons. The regionalist stories of the second half of the 19th century (including those by G.W. Cable, Bret Harte, Sarah Orne Jewett) are of this kind. On the other hand, there developed the impressionist story, a tale shaped and given meaning by the consciousness and psychological attitudes of the narrator. Predicated upon this element of subjectivity, these stories seem less objective and are less realistic in the outward sense. Of this sort are Poe's tales in which the hallucinations of a central character or narrator provide the details and facts of the story. Like the narrators in "The Tell-Tale Heart" (1843) and "The Imp of the Perverse" (1845), the narrator of "The Fall of the House of Usher" (1839) so distorts and transforms what he sees that the reader cannot hope to look objectively at the scene. Looking through an intermediary's eyes, the reader can see only the narrator's impressions of the scene.

Evolving in two strains

Some writers contributed to the development of both types of story. Washington Irving wrote several realistic sketches (*The Sketch-Book,* 1819–20; *The Alhambra,* 1832) in which he carefully recorded appearances and actions. Irving also wrote stories in which the details were taken not from ostensible reality but from within a character's mind. Much of the substance of "The Stout Gentleman" (1821), for example, is reshaped and recharged by the narrator's fertile imagination; "Rip Van Winkle" (1819) draws upon the symbolic surreality of Rip's dreams.

The short prose of Nathaniel Hawthorne illustrates that neither type of modern story, however, has exclusive rights to the use of symbol. On a few occasions, as in "My Kinsman, Major Molineux" (1832), Hawthorne's stories are about symbolic events as they are viewed subjectively by the central character. Hawthorne's greater gift, however, was for creating scenes, persons, and events that strike the reader as being actual historical facts and also as being rich in symbolic import. "Endicott and the Red Cross" (1837) may seem little more than a photographic sketch of a tableau out of history (the 17th-century Puritan leader cuts the red cross of St. George out of the colonial flag, the first act of rebellion against England), but the details are symbols of an underground of conflicting values and ideologies.

Several American writers, from Poe to James, were interested in the "impressionist" story that focusses on the impressions registered by events on the characters' minds,

The "impressionist" story

rather than the objective reality of the events themselves. In Herman Melville's "Bartleby the Scrivener" (1856) the narrator is a man who unintentionally reveals his own moral weaknesses through his telling of the story of Bartleby. Mark Twain's tales of animals ("The Celebrated Jumping Frog," 1865; "The Story of Old Ram," 1872; "Baker's Blue Jay Yarn," 1879), all impressionist stories, distort ostensible reality in a way that reflects on the men who are speaking. Ambrose Bierce's famous "An Occurrence at Owl Creek Bridge" (1891) is another example of this type of story in which the reader sees a mind at work—distorting, fabricating, and fantasizing—rather than an objective picture of actuality. In contrast, William Dean Howells usually sought an objectifying aesthetic distance. Though Howells was as interested in human psychology and behaviour as any of the impressionist writers, he did not want his details filtered through a biassed, and thus distorting, narrator. Impressionism, he felt, gave license for falsifications; in the hands of many writers of his day, it did in fact result in sentimental romanticizing.

But in other hands the impressionist technique could subtly delineate human responses. Henry James was such a writer. Throughout his prefaces to the New York edition of his works, the use of an interpreting "central intelligence" is constantly emphasized. "Again and again, on review," James observes, "the shorter things in especial that I have gathered into [the Edition] have ranged themselves not as my own impersonal account of the affair in hand, but as my account of somebody's impression of it." This use of a central intelligence, who is the "impersonal author's concrete deputy or delegate" in the story, allows James all the advantages of impressionism and, simultaneously, the freedom and mobility common to stories narrated by a disembodied voice.

In at least one way, 19th-century America resembled 16th-century Italy: there was an abundance of second- and third-rate short stories. And, yet, respect for the form grew substantially, and most of the great artists of the century were actively participating in its development. The seriousness with which many writers and readers regarded the short story is perhaps most clearly evident in the amount and kind of critical attention it received. James, Howells, Harte, Twain, Melville, and Hawthorne all discussed it as an art form, usually offering valuable insights, though sometimes shedding more light on their own work than on the art as a whole.

But the foremost American critic of the short story was Edgar Allan Poe. Himself a creator of influential impressionist techniques, Poe believed that the definitive characteristic of the short story was its unity of effect. "A skillful literary artist has constructed a tale," Poe wrote in his review of Hawthorne's *Twice-Told Tales* in 1842.

Poe's notion of the unity of effect

> If wise, he has not fashioned his thoughts to accommodate his incidents; but having conceived, with deliberate care, a certain unique or single *effect* to be wrought out, he then invents such incidents—he then combines such events as may best aid him in establishing this preconceived effect. If his very initial sentence tend not to the out-bringing of this effect, then he has failed in his first step. In the whole composition there should be no word written of which the tendency, direct or indirect, is not to the one pre-established design.

Poe's polemic primarily concerns craftsmanship and artistic integrity; it hardly prescribes limits on subject matter or dictates technique. As such, Poe's thesis leaves the story form open to experimentation and to growth while it demands that the form show evidence of artistic diligence and seriousness.

The new respect for the short story was also evident in France, as Henry James observed, when in 1844 Prosper "Mérimée with his handful of little stories was appointed to the French Academy." As illustrated by "Columbia" (1841) or "Carmen" (1845), which gained additional fame as an opera, Mérimée's stories are masterpieces of detached and dry observation, though the subject matter itself is often emotionally charged. Nineteenth-century France produced short stories as various as 19th-century America—although the impressionist tale was generally less common in France. (It is as if, not having an outstanding impressionist storyteller themselves, the French adopted Poe, who was being ignored by the critics in his own country.) The two major French impressionist writers were Charles Nodier, who experimented with symbolic fantasies, and Gérard de Nerval, whose collection *Les Filles du feu* (1854; "Daughters of Fire") grew out of recollections of his childhood. Artists primarily known for their work in other forms also attempted the short story—novelists like Honoré de Balzac and Gustave Flaubert and poets like Alfred de Vigny and Théophile Gautier.

French short stories

One of the most interesting writers of 19th-century France is Alphonse Daudet, whose stories reflect the spectrum of interest and techniques of the entire century. His earliest and most popular stories (*Lettres de mon moulin*, 1866; "Letters from My Mill") create a romantic, picturesque fantasy; his stories of the Franco-Prussian War (*Contes du Lundi*, 1873; "Monday's Tales") are more objectively realistic, and the sociological concern of his last works betrays his increasing interest in naturalistic determinism.

The greatest French storywriter, by far, is Guy de Maupassant, a master of the objective short story. Basically, Maupassant's stories are anecdotes that capture a revealing moment in the lives of middle class citizens. This crucial moment is typically recounted in a well-plotted design, though perhaps in some stories like "Boule de suif" (1880; "Ball of Tallow") and "The Necklace" (1881) the plot is too contrived, the reversing irony too neat, and the artifice too apparent. In other stories, like "The House of Madame Tellier" (1881), Maupassant's easy and fluid prose captures the innocence and the corruption of human behaviour.

A master of the objective story

During the first two decades of the 19th century in Russia, fable writing became a fad. By all accounts the most widely read fabulist was Ivan Krylov whose stories borrowed heavily from Aesop, La Fontaine, and various Germanic sources. If Krylov's tales made short prose popular in Russia, the stories of the revered poet Aleksandr Pushkin gained serious attention for the form. Somewhat like Mérimée in France (who was one of the first to translate Pushkin, Gogol, and Turgenev into French), Pushkin cultivated a detached, rather classical style for his stories of emotional conflicts (*The Queen of Spades*, 1834). Also very popular and respected was Mikhail Lermontov's "novel," *A Hero of Our Time* (1840), which actually consists of five stories that are more or less related.

Russian writers

But it is Nikolay Gogol who stands at the headwaters of the Russian short story; Dostoyevsky noted that all Russian short story writers "emerged from Gogol's overcoat," a punning allusion to the master's best known story. In a manner all his own, Gogol was developing impressionist techniques in Russia simultaneously with Poe in America. Gogol published his *Arabesques* (1835) five years before Poe collected some of his tales under a similar title. Like those of Poe, Gogol's tales of hallucination, confusing reality and dream, are among his best stories ("Nevsky Prospect" and "Diary of a Madman," both 1835). The single most influential story in the first half of the 19th century in Russia was undoubtedly Gogol's "Overcoat" (1842). Blending elements of realism (natural details from the characters' daily lives) with elements of fantasy (the central character returns as a ghost), Gogol's story seems to anticipate both the impressionism of Dostoyevsky's "Underground Man" and the realism of Tolstoy's "Ivan Ilich."

Ivan Turgenev appears, at first glance, antithetical to Gogol. In *A Sportsman's Notebook* (1852) Turgenev's simple use of language, his calm pace, and his restraint clearly differentiate him from Gogol. But like Gogol, Turgenev was more interested in capturing qualities of people and places than in building elaborate plots. A remaining difference between the two Russians, however, tends to make Turgenev more acceptable to 20th-century readers: Turgenev studiously avoided anything artificial. Though he may have brought into his realistic scenes a tale of a ghost ("Bezhin Meadow," 1852), he did not attempt to bring in a ghost (as Gogol had done in "The Overcoat"). In effect, Turgenev's allegiance was wholly to detached observation.

Developing some of the interests of Gogol, Fyodor Dostoyevsky experimented with the impressionist story. The early story "White Nights" (1848), for example, is a "Tale

of Love from the Reminiscence of a Dreamer" as the subtitle states; the title of one of his last stories, "The Dream of the Ridiculous Man" (1877), also echoes Poe and Gogol. Though sharing Dostoyevsky's interest in human motives, Leo Tolstoy used vastly different techniques. He usually sought psychological veracity through a more detached and, presumably, objective narrator ("The Death of Ivan Ilich," 1886; "The Kreutzer Sonata," 1891). Perhaps somewhat perplexed by Tolstoy's nonimpressionist means of capturing and delineating psychological impressions, Henry James pronounced Tolstoy the masterhand of the disconnection of method from matter.

The Russian master of the objective story was Anton Chekhov. No other storywriter so consistently as Chekhov turned out first-rate works. Though often compared to Maupassant, Chekhov is much less interested in constructing a well-plotted story; nothing much actually happens in Chekhov's stories, though much is revealed about his characters and the quality of their lives. While Maupassant focusses on event, Chekhov keeps his eye on character. Stories like "The Grasshopper" (1892), "The Darling" (1898), and "In the Ravine" (1900)—to name only three—all reveal Chekhov's perception, his compassion, and his subtle humour and irony. One critic says of Chekhov that he is no moralist—he simply says "you live badly, ladies and gentlemen," but his smile has the indulgence of a very wise man.

THE 20TH CENTURY

In the first half of the 20th century the appeal of the short story continued to grow. Literally hundreds of writers—including, as it seems, nearly every major dramatist, poet, and novelist—published thousands of excellent stories. William Faulkner suggested that writers often try their hand at poetry, find it too difficult, go on to the next most demanding form, the short story, fail at that, and only then settle for the novel. In the 20th century Germany, France, Russia, and the U.S. lost what had once appeared to be their exclusive domination of the form. Innovative and commanding writers emerged in countries that had previously exerted little influence on the genre: Sicily, for example, produced Luigi Pirandello; Czechoslovakia, Franz Kafka; Japan, Akutagawa Ryūnosuke; Argentina, Jorge Luis Borges. Literary journals with international circulation, such as Ford Madox Ford's *Transatlantic Review, Scribner's Magazine,* and Harriet Weaver's *Egoist,* provided a steady and prime exposure for young writers.

Increasing complexity of the short story

As the familiarity with it increased, the short story form itself became more varied and complex. The fundamental means of structuring a story underwent a significant change. The overwhelming or unique event that usually informed the 19th-century story fell out of favour with the storywriter of the early 20th century. He grew more interested in subtle actions and unspectacular events. Sherwood Anderson, one of the most influential U.S. writers of the early 20th century, observed that the common belief in his day was that stories had to be built around a plot, a notion that, in Anderson's opinion, appeared to poison all storytelling. His own aim was to achieve form, not plot, although form was more elusive and difficult. The record of the short story in the 20th century is dominated by this increased sensitivity to—and experimentation with—form. Although the popular writers of the century (like O. Henry in the U.S. and Paul Morand in France) may have continued to structure stories according to plot, the greater artists turned elsewhere for structure, frequently eliciting the response from cursory readers that "nothing *happens* in these stories." Narratives like Ernest Hemingway's "A Clean Well-Lighted Place" may seem to have no structure at all, so little physical action develops; but stories of this kind are actually structured around a psychological, rather than physical, conflict. In several of Hemingway's stories (as in many by D.H. Lawrence, Katherine Mansfield, and others), physical action and event are unimportant except insofar as the actions reveal the psychological underpinnings of the story. Stories came to be structured, also, in accordance with an underlying archetypal model: the specific plot and characters are important insofar as they allude to a traditional plot or figure, or to patterns that have recurred with wide implications in the history of mankind. Katherine Anne Porter's "Flowering Judas," for example, echoes and ironically inverts the traditional Christian legend. Still other stories are formed by means of motif, usually a thematic repetition of an image or detail that represents the dominant idea of the story. "The Dead," the final story in James Joyce's *Dubliners,* builds from a casual mention of death and snow early in the story to a culminating paragraph that links them in a profound vision. Seldom, of course, is the specific structure of one story appropriate for a different story. Faulkner, for example, used the traditional pattern of the knightly quest (in an ironic way) for his story "Was," but for "Barn Burning" he relied on a psychologically organic form to reveal the story of young Sarty Snopes.

The decline of the plot

No single form provided the 20th-century writer with the answer to structural problems. As the primary structuring agent, spectacular and suspenseful action was rather universally rejected around midcentury since motion pictures and television could present it much more vividly. As the periodicals that had supplied escapist stories to mass audiences declined, the short story became the favoured form of a smaller but intellectually more demanding readership. The Argentine Borges, for example, attracted an international following with his *Ficciones,* stories that involved the reader in dazzling displays of erudition and imagination, unlike anything previously encountered in the genre. Similarly, the American Donald Barthelme's composition consisted of bits and pieces of, *e.g.,* television commercials, political speeches, literary allusions, eavesdropped conversations, graphic symbols, dialogue from Hollywood movies—all interspersed with his own original prose in a manner that defied easy comprehension and yet compelled the full attention of the reader. The short story also lent itself to the rhetoric of student protest in the 1960s and was found in a bewildering variety of mixed-media forms in the "underground" press that publicized this life style throughout the world. In his deep concern with such a fundamental matter as form, the 20th-century writer unwittingly affirmed the maturation and popularity of the genre; only a secure and valued (not to mention flexible) genre could withstand and, moreover, encourage such experimentation. (A.J.H.)

DRAMA

Dramatic literature

The term dramatic literature implies a contradiction in that "literature" originally meant something written and "drama" meant something performed. Most of the problems, and much of the interest, in the study of dramatic literature stem from this contradiction. Even though a play may be appreciated solely for its qualities as writing, greater rewards probably accrue to those who remain alert to the volatility of the play as a whole.

In order to appreciate this complexity in drama, however, each of its elements—acting, directing, staging, etc.—should be studied, so that its relationship to all the others can be fully understood. It is the purpose of this section to study drama with particular attention to what the playwright sets down. A similar approach is taken in the following sections on the two main types of dramatic literature, *Tragedy,* and *Comedy.* The history of dramatic literature is discussed in such articles as THEATRE, THE HISTORY OF WESTERN; and EAST ASIAN ARTS; as well as in articles on the history of literature such as LITERATURE, THE HISTORY OF WESTERN. Regional studies of both the theatre and literature will be found in articles such as SOUTH ASIAN ARTS; and AFRICAN ARTS.

GENERAL CHARACTERISTICS

Essential elements of a play

From the inception of a play in the mind of its author to the image of it that an audience takes away from the theatre, many hands and many physical elements help to bring it to life. Questions therefore arise as to what is and what is not essential to it. Is a play what its author thought he was writing, or the words he wrote? Is a play the way in which those words are intended to be embodied, or their actual interpretation by a director and his actors on a particular stage? Is a play in part the expectation an audience brings to the theatre, or is it the real response to what is seen and heard? Since drama is such a complex process of communication, its study and evaluation is as uncertain as it is mercurial.

All plays depend upon a general agreement by all participants—author, actors, and audience—to accept the operation of theatre and the conventions associated with it, just as players and spectators accept the rules of a game. Drama is a decidedly unreal activity, which can be indulged only if everyone involved admits it. Here lies some of the fascination of its study. For one test of great drama is how far it can take the spectator beyond his own immediate reality and to what use this imaginative release can be put. But the student of drama must know the rules with which the players began the game before he can make this kind of judgment. These rules may be conventions of writing, acting, or audience expectation. Only when all conventions are working together smoothly in synthesis, and the make-believe of the experience is enjoyed passionately with mind and emotion, can great drama be seen for what it is: the combined work of a good playwright, good players, and a good audience who have come together in the best possible physical circumstances.

The late arrival of words in drama

Drama in some form is found in almost every society, primitive and civilized, and has served a wide variety of functions in the community. There are, for example, records of a sacred drama in Egypt 2,000 years before Christ, and Thespis in the 6th century BC in ancient Greece is accorded the distinction of being the first known playwright. Elements of drama such as mime and dance, costume and decor long preceded the introduction of words and the literary sophistication now associated with a play. Moreover, such basic elements were not superseded by words, merely enhanced by them. Nevertheless, it is only when a playscript assumes a disciplinary control over the dramatic experience that the student of drama gains measurable evidence of what was intended to constitute the play. Only then can dramatic literature be discussed as such.

The texts of plays indicate the different functions they served at different times. Some plays embraced nearly the whole community in a specifically religious celebration, as when all the male citizens of a Greek city-state came together to honour their gods; or when the annual Feast of Corpus Christi was celebrated with the great medieval Christian mystery cycles. On the other hand, the ceremonious temple ritual of the early Nō drama of Japan was performed at religious festivals only for the feudal aristocracy. But the drama may also serve a more directly didactic purpose, as did the morality plays of the later Middle Ages, some 19th-century melodramas, and the 20th-century discussion plays of George Bernard Shaw and Bertolt Brecht. Plays can satirize society, or they can gently illuminate human weakness; they can divine the greatness and the limitations of man in tragedy, or, in modern naturalistic playwriting, probe his mind. Drama is the most wide-ranging of all the arts: it not only represents life but also is a way of seeing it. And it repeatedly proves Dr. Samuel Johnson's contention that there can be no certain limit to the modes of composition open to the dramatist.

Common elements of drama. Despite the immense diversity of drama as a cultural activity, all plays have certain elements in common. For one thing, drama can never become a "private" statement—in the way a novel or a poem may be—without ceasing to be meaningful theatre. The characters may be superhuman and godlike in appearance, speech, and deed or grotesque and ridiculous, perhaps even puppets, but as long as they behave in even vaguely recognizable human ways the spectator can understand them. Only if they are too abstract do they cease to communicate as theatre. Thus, the figure of Death in medieval drama reasons like a human being, and a god in Greek tragedy or in Shakespeare talks like any mortal. A play, therefore, tells its tale by the imitation of human behaviour. The remoteness or nearness of that behaviour to the real life of the audience can importantly affect the response of that audience: it may be in awe of what it sees, or it may laugh with detached superiority at clownish antics, or it may feel sympathy. These differences of alienation or empathy are important, because it is by opening or closing this aesthetic gap between the stage and the audience that a dramatist is able to control the spectator's experience of the play and give it purpose.

The second essential is implicit in the first. Although static figures may be as meaningfully symbolic on a stage as in a painting, the deeper revelation of character, as well as the all-important control of the audience's responses, depends upon a dynamic presentation of the figures in action. A situation must be represented on the stage, one recognizable and believable to a degree, which will animate the figures as it would in life. Some argue that action is the primary factor in drama, and that character cannot emerge without it. Since no play exists without a situation, it appears impossible to detach the idea of a character from the situation in which he is placed, though it may seem possible after the experience of the whole play. Whether the playwright conceives character before situation, or vice versa, is arbitrary. More relevant are the scope and scale of the character-in-situation—whether, for example, it is man confronting God or man confronting his wife—for that comes closer to the kind of experience the play is offering its audience. Even here one must beware of passing hasty judgment, for it may be that the grandest design for heroic tragedy may be less affecting than the teasing vision of human madness portrayed in a good farce.

The role of style

A third factor is style. Every play prescribes its own style, though it will be influenced by the traditions of its theatre and the physical conditions of performance. Style is not something imposed by actors upon the text after it is written, nor is it superficial to the business of the play. Rather, it is self-evident that a play will not communicate without it. Indeed, many a successful play has style and little else. By "style," therefore, is implied the whole mood and spirit of the play, its degree of fantasy or realism, its quality of ritualism or illusion, and the way in which these qualities are signalled by the directions, explicit or implicit, in the text of the play. In its finer detail, a play's style controls the kind of gesture and movement of the actor, as well as his tone of speech, its pace and inflexion. In this way the attitude of the audience is prepared also: nothing is more disconcerting than to be misled into expecting either a comedy or a tragedy and to find the opposite, although some great plays deliberately introduce elements of both. By means of signals of style, the audience may be led to expect that the play will follow known paths, and the pattern of the play will regularly echo the rhythm of response in the auditorium. Drama is a conventional game, and spectators cannot participate if the rules are constantly broken.

By presenting animate characters in a situation with a certain style and according to a given pattern, a playwright will endeavour to communicate his thoughts and feelings and have his audience consider his ideas or reproduce the emotion that drove him to write as he did. In theatrical communication, however, audiences remain living and independent participants. In the process of performance, an actor has the duty of interpreting his author for the people watching him, and will expect to receive "feedback" in turn. The author must reckon with this in his writing. Ideas will not be accepted, perhaps, if they are offered forthrightly; and great dramatists who are intent on furthering social or political ideas, such as Henrik Ibsen, George Bernard Shaw, and Bertolt Brecht, quickly learned methods of having the spectator reason the ideas for himself as part of his response to the play. Nor will passions necessarily be aroused if overstatement of feeling

("sentimentality") is used without a due balance of thinking and even the detachment of laughter: Shakespeare and Chekhov are two outstanding examples in Western drama of writers who achieved an exquisite balance of pathos with comedy in order to ensure the affective function of their plays.

Dramatic expression. The language of drama can range between great extremes: on the one hand, an intensely theatrical and ritualistic manner; and on the other, an almost exact reproduction of real life of the kind commonly associated with motion picture and television drama. In the ritualistic drama of ancient Greece, the playwrights wrote in verse, and it may be assumed that their actors rendered this in an incantatory speech halfway between speech and song. Both the popular and the coterie drama of the Chinese and Japanese theatre were also essentially operatic, with a lyrical dialogue accompanied by music and chanted rhythmically. The effect of such rhythmical delivery of the words was to lift the mood of the whole theatre onto the level of religious worship. Verse is employed in other drama that is conventionally elevated, like the Christian drama of the Middle Ages, the tragedy of the English Renaissance, the heroic Neoclassical tragedies of 17th-century France by Pierre Corneille and Jean Racine, the Romantic lyricism of Goethe and Schiller, and modern attempts at a revival of a religious theatre like those of T.S. Eliot. Indeed, plays written in prose dialogue were at one time comparatively rare, and then associated essentially with the comic stage. Only at the end of the 19th century, when naturalistic realism became the mode, were characters in dramas expected to speak as well as behave as in real life.

The role of verse

Elevation is not the whole rationale behind the use of verse in drama. Some critics maintain that a playwright can exercise better control both over the speech and movement of his actors and over the responses of his audience by using the more subtle tones and rhythms of good poetry. The loose, idiomatic rhythms of ordinary conversation, it is argued, give both actor and spectator too much freedom of interpretation and response. Certainly, the aural, kinetic, and emotive directives in verse are more direct than prose, though, in the hands of a master of prose dialogue like Shaw or Chekhov, prose can also share these qualities. Even more certain, the "aesthetic distance" of the stage, or the degree of unreality and make-believe required to release the imagination, is considerably assisted if the play uses elements of verse, like rhythm and rhyme, not found in ordinary speech. Thus, verse drama may embrace a wide variety of nonrealistic aural and visual devices: Greek tragic choric speech provided a philosophical commentary upon the action, which at the same time drew the audience lyrically into the mood of the play. In the drama of India, a verse accompaniment made the actors' highly stylized system of symbolic gestures of head and eyes, arms and fingers a harmonious whole. The tragic soliloquy in Shakespeare permitted the hero, alone on the stage with his audience, to review his thoughts aloud in the persuasive terms of poetry; thus, the soliloquy was not a stopping place in the action but rather an engrossing moment of drama when the spectator's mind could leap forward.

Dramatic structure. The elements of a play do not combine naturally to create a dramatic experience but, rather, are made to work together through the structure of a play, a major factor in the total impact of the experience. A playwright will determine the shape of a play in part according to the conditions in which it will be performed: how long should it take to engage an audience's interest and sustain it? How long can an audience remain in their seats? Is the audience sitting in one place for the duration of performance, or is it moving from one pageant stage to the next, as in some medieval festivals? Structure is also dictated by the particular demands of the material to be dramatized: a revue sketch that turns on a single joke will differ in shape from a religious cycle, which may portray the whole history of mankind from the Creation to the Last Judgment. A realistic drama may require a good deal of exposition of the backgrounds and memories of the characters, while in a chronicle play the playwright may tell the whole story episodically from its beginning to the end. There is one general rule, as Aristotle originally suggested in his *Poetics:* a play must be long enough to supply the information an audience needs to be interested and to generate the experience of tragedy, or comedy, on the senses and imagination.

In the majority of plays it is necessary to establish a conventional code of place and time. In a play in which the stage must closely approximate reality, the location of the action will be precisely identified, and the scenic representation on stage must confirm the illusion. In such a play, stage time will follow chronological time almost exactly; and if the drama is broken into three, four, or five acts, the spectator will expect each change of scene to adjust the clock or the calendar. But the theatre has rarely expected realism, and by its nature it allows an extraordinary freedom to the playwright in symbolizing location and duration: as Dr. Samuel Johnson observed in his discussion of this freedom in Shakespeare, the spectators always allow the play to manipulate the imagination. It is sufficient for the witches in *Macbeth* to remark their "heath" with its "fog and filthy air" for their location to be accepted on a stage without scenery; and when Lady Macbeth later is seen alone reading a letter, she is without hesitation understood to be in surroundings appropriate to the wife of a Scottish nobleman. Simple stage symbolism may assist the imagination, whether the altar of the gods situated in the centre of the Greek *orchēstra,* a strip of red cloth to represent the Red Sea in a medieval miracle play, or a chair on which the Tibetan performer stands to represent a mountain. With this degree of fantasy, it is no wonder that the theatre can manipulate time as freely, passing from the past to the future, from this world to the next, and from reality to dream.

Conventions of time and place

It is questionable, therefore, whether the notion of "action" in a play describes what happens on the stage or what is recreated in the mind of the audience. Certainly it has little to do with merely physical activity by the players. Rather, anything that urges forward the audience's image of the play and encourages the growth of its imagination is a valid part of the play's action. Thus, it was sufficient for the ancient Greek dramatist Aeschylus to have only two speaking male actors who wore various masks, typed for sex, age, class, and facial expression. In the Italian 16th- and 17th-century commedia dell'arte, the standard characters Pantalone and Arlecchino, each wearing his traditional costume and mask, appeared in play after play and were immediately recognized, so that an audience could anticipate the behaviour of the grasping old merchant and his rascally servant. On a less obvious level, a speech that in reading seems to contribute nothing to the action of the play can provide in performance a striking stimulus to the audience's sense of the action, its direction and meaning. Thus, both the Greek chorus and the Elizabethan actor in soliloquy might be seen to "do" nothing, but their intimate speeches of evaluation and reassessment teach the spectator how to think and feel about the action of the main stage and lend great weight to the events of the play. For drama is a reactive art, moving constantly in time, and any convention that promotes a deep response while conserving precious time is of immeasurable value.

Conventions of action

DRAMA AS AN EXPRESSION OF A CULTURE

In spite of the wide divergencies in purpose and convention of plays as diverse as the popular kabuki of Japan and the coterie comedies of the Restoration in England, a Javanese puppet play and a modern social drama by the contemporary American dramatist Arthur Miller, all forms of dramatic literature have some points in common. Differences between plays arise from differences in conditions of performance, in local conventions, in the purpose of theatre within the community, and in cultural history. Of these, the cultural background is the most important, if the most elusive. It is cultural difference that makes the drama of the East immediately distinguishable from that of the West.

East–West differences. Oriental drama consists chiefly of the classical theatre of Hindu India and its derivatives in Malaya and of Burma, Thailand, China, Japan, Java,

and Bali. It was at its peak during the period known in the West as the Middle Ages and the Renaissance. Stable and conservative, perpetuating its customs with reverence, Oriental culture showed little of the interest in chronology and advancement shown by the West and placed little emphasis on authors and their individual achievements. Thus the origins of the drama of the Orient are lost in time, although its themes and characteristic styles probably remain much the same as before records were kept. The slow-paced, self-contained civilizations of the East have only recently been affected by Western theatre, just as the West has only recently become conscious of the theatrical wealth of the East and what it could do to fertilize the modern theatre (as in the 20th-century experimental drama of William Butler Yeats and Thornton Wilder in English, of Paul Claudel and Antonin Artaud in French, and of Bertolt Brecht in German).

Stylization of Oriental theatre

In its representation of life, classical Oriental drama is the most conventional and nonrealistic in world theatre. Performed over the centuries by actors devoted selflessly to the profession of a traditional art, conventions of performance became highly stylized, and traditions of characterization and play structure became formalized to a point of exceptional finesse, subtlety, and sophistication. In Oriental drama all the elements of the performing arts are made by usage to combine to perfection: dance and mime, speech and song, narrative and poetry. The display and studied gestures of the actors, their refined dance patterns, and the all-pervasive instrumental accompaniment to the voices of the players and the action of the play, suggest to Western eyes an exquisite combination of ballet with opera, in which the written text assumes a subordinate role. In this drama, place could be shifted with a license that would have astonished the most romantic of Elizabethan dramatists, the action could leap back in time in a way reminiscent of the "flashback" of the modern cinema, and events could be telescoped with the abandon of modern expressionism. This extreme theatricality lent an imaginative freedom to its artists and audiences upon which great theatre could thrive. Significantly, most Oriental cultures also nourished a puppet theatre, in which stylization of character, action, and staging were particularly suitable to marionettes. In the classical puppet theatre of Japan, the *bunraku*, the elocutionary art of a chanted narration and the manipulative skill with the dolls diminished the emphasis on the script except in the work of the 17th-century master Chikamatsu, who enjoyed a creative freedom in writing for puppets rather than for the actors of the Kabuki. By contrast, Western drama during and after the Renaissance has offered increasing realism, not only in decor and costume but also in the treatment of character and situation.

It is generally thought that Oriental drama, like that of the West, had its beginnings in religious festivals. Dramatists retained the moral tone of religious drama while using popular legendary stories to imbue their plays with a romantic and sometimes sensational quality. This was never the sensationalism of novelty that Western dramatists sometimes used: Eastern invention is merely a variation on what is already familiar, so that the slightest changes of emphasis could give pleasure to the cognoscenti. This kind of subtlety is not unlike that found in the repeatedly depicted myths of Greek tragedy. What is always missing in Oriental drama is that restlessness for change characteristic of modern Western drama. In the West, religious questioning, spiritual disunity, and a belief in the individual vision combined finally with commercial pressures to produce comparatively rapid changes. None of the moral probing of Greek tragedy, the character psychology of Shakespeare and Racine, the social and spiritual criticism of Ibsen and Strindberg, nor the contemporary drama of shock and argument, is imaginable in the classical drama of the East.

Drama in Western cultures. The form and style of ancient Greek tragedy, which flowered in the 5th century BC in Athens, was dictated by its ritual origins and by its performance in the great dramatic competitions of the spring and winter festivals of Dionysus. Participation in ritual requires that the audience largely knows what to expect. Ritual dramas were written on the same legendary stories of Greek heroes in festival after festival. Each new drama provided the spectators with a reassessment of the meaning of the legend along with a corporate religious exercise. Thus, the chorus of Greek tragedy played an important part in conveying the dramatist's intention. The chorus not only provided a commentary on the action but also guided the moral and religious thought and emotion of the audience throughout the play: for Aeschylus (*c.* 525–456 BC) and Sophocles (*c.* 496–406 BC) it might be said that the chorus *was* the play, and even for Euripides (*c.* 480–406 BC) it remained lyrically powerful. Other elements of performance also controlled the dramatist in the form and style he could use in these plays: in particular, the great size of the Greek arena demanded that the players make grand but simple gestures and intone a poetry that could never approach modern conversational dialogue. Today, the superhuman characters of these plays, Agamemnon and Clytemnestra, Orestes and Electra, Oedipus and Antigone, seem unreal, for they display little "characterization" in the modern sense and their fates are sealed. Nevertheless, these great operatic tableaux, built, as one critic has said, for weight and not speed, were evidently able to carry their huge audiences to a catharsis of feeling. It is a mark of the piety of those audiences that the same reverent festivals supported a leavening of satyr-plays and comedies, bawdy and irreverent comments on the themes of the tragedies, culminating in the wildly inventive satires of Aristophanes (*c.* 445–*c.* 385 BC.)

Use of familiar legends

The study of Greek drama demonstrates how the ritual function of theatre shapes both play and performance. This ritual aspect was lost when the Romans assimilated Greek tragedy and comedy. The Roman comedies of Plautus (*c.* 254–184 BC) and Terence (*c.* 186/185–159 BC) were brilliant but inoffensive entertainments, while the oratorical tragedies of Seneca (*c.* 4 BC–AD 65) on themes from the Greek were written probably only to be read by the ruling caste. Nevertheless, some of the dramatic techniques of these playwrights influenced the shape and content of plays of later times. The bold prototype characters of Plautus (the boasting soldier, the old miser, the rascally parasite), with the intricacies of his farcical plotting, and the sensational content and stoical attitudes of Seneca's drama reappeared centuries later when classical literature was rediscovered.

Establishment of prototypes of characters

Western drama had a new beginning in the medieval church, and, again, the texts reflect the ritual function of the theatre in society. The Easter liturgy, the climax of the Christian calendar, explains much of the form of medieval drama as it developed into the giant mystery cycles. From at least the 10th century the clerics of the church enacted the simple Latin liturgy of the *Quem quaeritis?* (literally "Whom do you seek?"), the account of the visit to Jesus Christ's tomb by the three Marys, who are asked this question by an angel. The liturgical form of Lent and the Passion, indeed, embodies the drama of the Resurrection to be shared mutually by actor-priest and audience-congregation. When the Feast of Corpus Christi was instituted in 1246, the great lay cycles of Biblical plays (the mystery or miracle cycles) developed rapidly, eventually treating the whole story of man from the Creation to the Last Judgment, with the Crucifixion still the climax of the experience. The other influence controlling their form and style was their manner of performance. The vast quantity of material that made up the story was broken into many short plays, and each was played on its own stage in the vernacular by members of the craft guilds. Thus, the authors of these dramas gave their audience not a mass communal experience, as the Greek dramatists had done, but rather many small and intimate dramatizations of the Bible story. In stylized and alliterative poetry, they mixed awesome events with moments of extraordinary simplicity, embodying local details, familiar touches of behaviour, and the comedy and the cruelty of medieval life. Their drama consists of strong and broad contrasts, huge in perspective but meaningful in human terms, religious and appropriately didactic in content and yet popular in its manner of reaching its simple audiences.

In an account of dramatic literature, the ebullient but

unscripted farces and romances of the commedia dell'arte properly have no place, but much in it became the basis of succeeding comedy. Two elements are worth noting.

The influence of improvisation

First, the improvisational spirit of the commedia troupes, in which the actor would invent words and comic business (*lazzi*) to meet the occasion of the play and the audience he faced, encouraged a spontaneity in the action that has affected the writing and playing of Western comedy ever since. Second, basic types of comic character derived from the central characters, who reappeared in the same masks in play after play. As these characters became well known everywhere, dramatists could rely on their audience to respond to them in predictable fashion. Their masks stylized the whole play and allowed the spectator freedom to laugh at the unreality of the action. An understanding of the commedia illuminates a great deal in the written comedies of Shakespeare in England, of Molière and Marivaux in France, and of Goldoni and Gozzi in Italy.

In the 16th century, England and Spain provided all the conditions necessary for a drama that could rival ancient Greek drama in scope and subtlety. In both nations, there were public as well as private playhouses, audiences of avid imagination, a developing language that invited its poetic expansion, a rapid growth of professional acting companies, and a simple but flexible stage. All these factors combined to provide the dramatist with an opportunity to create a varied and exploratory new drama of outstanding interest. In Elizabethan London, dramatists wrote in an extraordinary range of dramatic genres, from native comedy and farce to Senecan tragedy, from didactic morality plays to popular chronicle plays and tragicomedies, all before the advent of Shakespeare (1564–1616). Although Shakespeare developed certain genres, such as the chronicle play and the tragedy, to a high degree, Elizabethan dramatists characteristically used a medley of styles. With the exception of Ben Jonson (1572/73–1637) and a few others, playwrights mixed their ingredients without regard for classical rule. The result was a rich body of drama, exciting and experimental in character. A host of new devices were tested, mixing laughter and passion; shifting focus and perspective by slipping from verse to prose and back again; extending the use of the popular clown; exploiting the double values implicit in boy actors playing the parts of girls; exploring the role of the actor in and out of character; but, above all, developing an extraordinarily flexible dramatic poetry. These dramatists produced a visually and aurally exciting hybrid drama that could stress every subtlety of thought and feeling. It is not surprising that they selected their themes from every Renaissance problem of order and authority, of passion and reason, of good and evil and explored every comic attitude to people and society with unsurpassed vigour and vision.

Quite independently in Spain, dramatists embarked upon a parallel development of genres ranging from popular farce to chivalric tragedy. The hundreds of plays of Spain's greatest playwright, Lope de Vega (1562–1635), cover every subject from social satire to religion with equal exuberance.

French drama in the 17th century

The drama of Paris of the 17th century, however, was determined by two extremes of dramatic influence. On the one hand, some playwrights developed a tragedy rigidly based in form upon Neoclassical notions of Aristotelian unity, controlled by verse that is more regular than that of the Spanish or English dramatists. On the other hand, the French theatre developed a comedy strongly reflecting the work of the itinerant troupes of the commedia dell'arte. The Aristotelian influence resulted in the plays of Pierre Corneille (1606–84) and Jean Racine (1639–99), tragedies of honour using classical themes, highly sophisticated theatrical instruments capable of searching deeply into character and motive, and capable of creating the powerful tension of a tightly controlled plot. The other influence produced the brilliant plays of Molière (1622–73), whose training as an actor in the masked and balletic commedia tradition supplied him with a perfect mode for a more sophisticated comedy. Molière's work established the norm of French comedy, bold in plotting, exquisite in style, irresistible in comic suggestion. Soon after, upon the return of Charles II to the throne of England in 1660, a revival of theatre started the English drama on a new course. Wits such as William Wycherley (1640–1716) and William Congreve (1670–1729) wrote for the intimate playhouses of the Restoration and an unusually homogeneous coterie audience of the court circle. They developed a "comedy of manners," replete with social jokes that the actor, author, and spectator could share—a unique phase in the history of drama. These plays started a characteristic style of English domestic comedy still recognizable in London comedy today.

German dramatists of the later part of the 18th century achieved stature through a quite different type of play: Johann Wolfgang von Goethe (1749–1832), Johann Christoph Friedrich von Schiller (1759–1805), and others of the passionate, poetic Sturm und Drang ("storm and stress") movement tried to echo the more romantic tendencies in Shakespeare's plays. Dramatists of the 19th century, however, lacking the discipline of classical form, wrote derivative melodramas that varied widely in quality, often degenerating into mere sensationalism. Melodrama rapidly became the staple of the theatre across Europe and America. Bold in plotting and characterization, simple in its evangelical belief that virtue will triumph and providence always intervene, it pleased vast popular audiences and was arguably the most prolific and successful drama in the history of the theatre. Certainly, melodrama's elements of essential theatre should not be ignored by those interested in drama as a social phenomenon. At least melodramas encouraged an expansion of theatre audiences ready for the most recent phase in dramatic history.

Melodrama

The time grew ripe for a new and more adult drama at the end of the 19th century. As novelists developed greater naturalism in both content and style, dramatists too looked to new and more realistic departures: the dialectical comedies of ideas of George Bernard Shaw (1856–1950); the problem plays associated with Henrik Ibsen (1828–1906); the more lyrical social portraits of Anton Chekhov (1860–1904); the fiercely personal, social, and spiritual visions of August Strindberg (1849–1912). These dramatists began by staging the speech and behaviour of real life, in devoted detail, but became more interested in the symbolic and poetic revelation of the human condition. Where Ibsen began by modelling his tightly structured dramas of man in society upon the formula for the "well made" play, which carefully controlled the audience's interest to the final curtain, Strindberg, a generation later, developed a free psychological and religious dream play that bordered on Expressionism. As sophisticated audiences grew interested more in causes rather than in effects, the great European playwrights of the turn of the century mixed their realism increasingly with symbolism. Thus the Naturalistic movement in drama, though still not dead, had a short but vigorous life. Its leaders freed the drama of the 20th century to pursue every kind of style, and subsequent dramatists have been wildly experimental. The playwright today can adopt any dramatic mode, mixing his effects to shock the spectator into an awareness of himself, his beliefs, and his environment.

Drama in Eastern cultures. Because of its inborn conservatism, the dramatic literature of the East does not show such diversity, despite its variety of cultures and subcultures. The major features of Oriental drama may be seen in the three great classical sources of India, China, and Japan. The simplicity of the Indian stage, a platform erected for the occasion in a palace or a courtyard, like the simplicity of the Elizabethan stage, lent great freedom to the imagination of the playwright. In the plays of India's greatest playwright, Kālidāsa (probably 4th century AD), there is an exquisite refinement of detail in presentation. His delicate romantic tales leap time and place by simple suggestion and mingle courtly humour and light-hearted wit with charming sentiment and religious piety. Quite untrammelled by realism, lyrical in tone and refined in feeling, his fanciful love and adventure stories completely justify their function as pure entertainment. His plots are without the pain of reality, and his characters never descend from the ideal: such poetic drama is entirely appropriate to the Hindu aesthetic of blissful idealism in art.

Indian theatre

Some contrast may be felt between the idealistic style of the Sanskrit drama and the broader, less courtly man-

ner of the Chinese and its derivatives in Southeast Asia. These plays cover a large variety of subjects and styles, but all combine music, speech, song, and dance, as does all Oriental drama. Heroic legends, pathetic moral stories, and brilliant farces all blended spectacle and lyricism and were as acceptable to a sophisticated court audience as to a popular street audience. The most important Chinese plays stem from the Yüan dynasty (1206–1368), in which an episodic narrative is carefully structured and unified. Each scene introduces a song whose lines have a single rhyme, usually performed by one singer, with a code of symbolic gestures and intonations that has been refined to an extreme. The plays have strongly typed heroes and villains, simple plots, scenes of bold emotion, and moments of pure mime. Chinese drama avoided both the crudity of European melodrama and the esotericism of Western coterie drama.

Nō and Kabuki

The drama of Japan may be said to embrace both. There, the exquisite artistry of gesture and mime, and the symbolism of setting and costume, took two major directions. The Nō drama, emerging from religious ritual, maintained a special refinement appropriate to its origins and its aristocratic audiences; the Kabuki (its name suggesting its composition: *ka,* "singing"; *bu,* "dancing"; *ki,* "acting") in the 17th century became Japan's popular drama. Nō theatre is reminiscent of the religious tragedy of the Greeks in the remoteness of its legendary content, in its masked heroic characters, in its limit of two actors and a chorus, and in the static, oratorical majesty of its style. The Kabuki, on the other hand, finds its material in domestic stories and in popular history, and the actors, without masks, move and speak more freely, without seeming to be realistic. The Kabuki plays are less rarefied and are often fiercely energetic and wildly emotional as befitting their presentation before a broader audience. The written text of the Nō play is highly poetic and pious in tone, compressed in its imaginative ideas, fastidious and restrained in verbal expression, and formal in its sparse plotting; the text of a Kabuki play lends plentiful opportunities for spectacle, sensation, and melodrama. In the Kabuki there can be moments of realism, but also whole episodes of mime and acrobatics; there can be moments of slapstick, but also moments of violent passion. In all, the words are subordinate to performance in the Kabuki.

Drama and communal belief. The drama that is most meaningful and pertinent to its society is that which arises from it and is not imposed upon it. The religious drama of ancient Greece, the temple drama of early India and Japan, the mystery cycles of medieval Europe, all have in common more than their religious content: when the theatre is a place of worship, its drama goes to the roots of belief in a particular community. The dramatic experience becomes a natural extension of man's life both as an individual and as a social being. The content of the mystery cycles speaks formally for the orthodox dogma of the church, thus seeming to place the plays at the centre of medieval life, like the church itself. Within such a comprehensive scheme, particular needs could be satisfied by comic or pathetic demonstration; for example, such a crucial belief as that of the Virgin Birth of Jesus was presented in the York (England) cycle of mystery plays, of the 14th–16th centuries, with a nicely balanced didacticism when Joseph wonders how a man of his age could have got Mary with child and an Angel explains what has happened; the humour reflects the simplicity of the audience and at the same time indicates the perfect faith that permitted the near-blasphemy of the joke. In the tragedies Shakespeare wrote for the Elizabethan theatre, he had the same gift of satisfying deep communal needs while meeting a whole range of individual interests present in his audience.

Didactic drama

When the whole community shares a common heritage, patriotic drama and drama commemorating national heroes, as are seen almost universally in the Orient, is of this kind. Modern Western attempts at a religious didactic drama, or indeed at any drama of "ideas," have had to reckon with the disparate nature of the audience. Thus the impact of Ibsen's social drama both encouraged and divided the development of the theatre in the last years of the 19th century. Plays like *A Doll's House* (1879) and *Ghosts* (published 1881), which challenged the sanctity of marriage and questioned the loyalty a wife owed to her husband, took their audiences by storm: some violently rejected the criticism of their cherished social beliefs, and thus such plays may be said to have failed to persuade general audiences to examine their moral position; on the other hand, there were sufficient numbers of enthusiasts (so-called Ibsenites) to stimulate a new drama of ideas. "Problem" plays appeared all over Europe and undoubtedly rejuvenated the theatre for the 20th century. Shaw's early Ibsenite plays in London, attacking a negative drawing-room comedy with themes of slum landlordism (*Widowers' Houses,* 1892) and prostitution (*Mrs. Warren's Profession,* 1902) resulted only in failure, but Shaw quickly found a comic style that was more disarming. In his attack on false patriotism (*Arms and the Man,* 1894) and the motives for middle class marriage (*Candida,* 1897), he does not affront his audiences before leading them by gentle laughter and surprise to review their own positions.

INFLUENCES ON THE DRAMATIST

The author of a play is affected, consciously or unconsciously, by the conditions under which he conceives and writes, by his social and economic status as a playwright, by his personal background, by his religious or political position, by his purpose in writing. The literary form of the play and its stylistic elements will be influenced by tradition, a received body of theory and dramatic criticism, as well as by the author's innovative energy. Auxiliary theatre arts such as music and design also have their own controlling traditions and conventions, which the playwright must respect. The size and shape of the playhouse, the nature of its stage and equipment, and the actor–audience relationship it encourages also determine the character of the writing. Not least, the audience's cultural assumptions, holy or profane, local or international, social or political, may override all else in deciding the form and content of the drama. These are large considerations that can take the student of drama into areas of sociology, politics, social history, religion, literary criticism, philosophy and aesthetics, and beyond.

The role of theory. It is difficult to assess the influence of theory since theory usually is based on existing drama, rather than drama on theory. Philosophers, critics, and dramatists have attempted both to describe what happens and to prescribe what should happen in drama, but all their theories are affected by what they have seen and read.

Western theory. In Europe, the earliest extant work of dramatic theory, the fragmentary *Poetics* of Aristotle (384–322 BC), chiefly reflecting his views on Greek tragedy and his favorite dramatist, Sophocles, is still relevant to an understanding of the elements of drama. Aristotle's elliptical way of writing, however, encouraged different ages to place their own interpretation upon his statements and to take as prescriptive what many believe to have been meant only to be descriptive. There has been endless discussion of his concepts *mimēsis* ("imitation"), the impulse behind all the arts, and *katharsis* ("purgation," "purification of emotion"), the proper end of tragedy, though these notions were conceived, in part, in answer to Plato's attack on *poiēsis* (making) as an appeal to the irrational. That "character" is second in importance to "plot" is another of Aristotle's concepts that may be understood with reference to the practice of the Greeks, but not more realistic drama, in which character psychology has a dominant importance. The concept in the *Poetics* that has most affected the composition of plays in later ages has been that of the so-called unities—that is, of time, place, and action. Aristotle was evidently describing what he observed—that a typical Greek tragedy had a single plot and action that lasts one day; he made no mention at all of unity of place. Neoclassical critics of the 17th century, however, codified these discussions into rules.

"Rules" of drama

Considering the inconvenience of such rules and their final unimportance, one wonders at the extent of their influence. The Renaissance desire to follow the ancients and its enthusiasm for decorum and classification may explain it in part. Happily, the other classical work recognized at this time was Horace's *Art of Poetry* (c. 24 BC), with its

basic precept that poetry should offer pleasure and profit and teach by pleasing, a notion that has general validity to this day. Happily, too, the popular drama, which followed the tastes of its patrons, also exerted a liberating influence. Nevertheless, discussion about the supposed need for the unities continued throughout the 17th century (culminating in the French critic Nicolas Boileau's *Art of Poetry,* originally published in 1674), particularly in France, where a master like Racine could translate the rules into a taut, intense theatrical experience. Only in Spain, where Lope de Vega published his *New Art of Writing Plays* (1609), written out of his experience with popular audiences, was a commonsense voice raised against the classical rules, particularly on behalf of the importance of comedy and its natural mixture with tragedy. In England both Sir Philip Sidney in his *Apologie for Poetry* (1595) and Ben Jonson in *Timber* (1640) merely attacked contemporary stage practice. Jonson, in certain prefaces, however, also developed a tested theory of comic characterization (the "humours") that was to affect English comedy for a hundred years. The best of Neoclassical criticism in English is John Dryden's *Of Dramatick Poesie, an Essay* (1668). Dryden approached the rules with a refreshing honesty and argued all sides of the question; thus he questioned the function of the unities and accepted Shakespeare's practice of mixing comedy and tragedy.

The lively imitation of nature came to be acknowledged as the primary business of the playwright and was confirmed by the authoritative voices of Dr. Samuel Johnson, who said in his *Preface to Shakespeare* (1765) "there is always an appeal open from criticism to nature," and the German dramatist and critic Gotthold Ephraim Lessing, who in his *Hamburgische Dramaturgie* (or *Hamburg Dramaturgy;* 1767–69) sought to accommodate Shakespeare to a new view of Aristotle. With the classical straitjacket removed, there was a release of dramatic energies in new directions. There were still local critical skirmishes, such as Jeremy Collier's attack on the "immorality and profaneness of the English stage" in 1698; Goldoni's attacks upon the already dying Italian commedia on behalf of greater realism; and Voltaire's reactionary wish to return to the unities and to rhymed verse in French tragedy, which was challenged in turn by Diderot's call for a return to nature. But the way was open for the development of the middle class *drame* and the excursions of romanticism. Victor Hugo, in his Preface to his play *Cromwell* (1827), capitalized on the new psychological romanticism of Goethe and Schiller as well as the popularity of the sentimental *drame* in France and the growing admiration for Shakespeare; Hugo advocated truth to nature and a dramatic diversity that could yoke together the sublime and the grotesque. This view of what drama should be received support from Émile Zola in the preface to his play *Thérèse Raquin* (1873), in which he argued a theory of naturalism that called for the accurate observation of people controlled by their heredity and environment. From such sources came the subsequent intellectual approach of Ibsen and Chekhov and a new freedom for such seminal innovators of the 20th century as Luigi Pirandello, with his teasing mixtures of absurdist laughter and psychological shock; Bertolt Brecht (1898–1956), deliberately breaking the illusion of the stage; and Antonin Artaud (1896–1948), advocating a theatre that should be "cruel" to its audience, employing all and any devices that lie to hand. The modern dramatist may be grateful that he is no longer hidebound by theory and yet also regret, paradoxically, that the theatre of his time lacks those artificial limits within which an artifact of more certain efficiency can be wrought.

Twentieth-century views

Eastern theory. The Oriental theatre has always had such limits, but with neither the body of theory nor the pattern of rebellion and reaction found in the West. The Sanskrit drama of India, however, throughout its recorded existence has had the supreme authority of the *Nāṭya-śāstra,* ascribed to Bharata (*c.* 1st century AD), an exhaustive compendium of rules for all the performing arts, but particularly for the sacred art of drama with its auxiliary arts of dance and music. Not only does the *Nāṭya-śāstra* identify many varieties of gesture and movement but it also describes the multiple patterns that drama can assume, similar to a modern treatise on musical form. Every conceivable aspect of a play is treated, from the choice of metre in poetry to the range of moods a play can achieve; but perhaps its primary importance lies in its justification of the aesthetic of Indian drama as a vehicle of religious enlightenment.

In Japan, the most celebrated of early Nō writers, Zeami Motokiyo (1363–1443), left an influential collection of essays and notes to his son about his practice, and his deep knowledge of Zen Buddhism infused the Nō drama with ideals for the art that have persisted. Religious serenity of mind (*yūgen*), conveyed through an exquisite elegance in a performance of high seriousness, is at the heart of Zeami's theory of dramatic art. Three centuries later, the outstanding dramatist Chikamatsu (1653–1725) built equally substantial foundations for the Japanese puppet theatre, later known as the *bunraku.* His heroic plays for this theatre established an unassailable dramatic tradition of depicting an idealized life inspired by a rigid code of honour and expressed with extravagant ceremony and fervent lyricism. At the same time, in another vein, his pathetic "domestic" plays of middle class life and the suicides of lovers established a comparatively realistic mode for Japanese drama, which strikingly extended the range of both the *bunraku* and the Kabuki. Today, these forms, together with the more aristocratic and intellectual Nō, constitute a classical theatre based on practice rather than on theory. They may be superseded as a result of the recent invasion of Western drama, but in their perfection they are unlikely to change. The Yüan drama of China was similarly based upon a slowly evolved body of laws and conventions derived from practice, for, like the Kabuki of Japan, this too was essentially an actors' theatre, and practice rather than theory accounts for its development.

The role of music and dance. The Sanskrit treatise *Nāṭya-śāstra* suggests that drama had its origin in the art of dance, and any survey of Western theatre, too, must recognize a comparable debt to music in the classical Greek drama, which is believed to have sprung from celebratory singing to Dionysus. Similarly, the drama of the medieval church began with the chanted liturgies of the Roman mass. In the professional playhouses of the Renaissance and after, only rarely is music absent: Shakespeare's plays, particularly the comedies, are rich with song, and the skill with which he pursues dramatic ends with musical help is a study in itself. Molière conceived most of his plays as comedy-ballets, and much of his verbal style derives directly from the balletic qualities of the commedia. The popularity of opera in the 18th century led variously to John Gay's prototype for satirical ballad-opera, *The Beggar's Opera* (1728), the opera buffa in Italy, and the opéra comique in France. The development of these forms, however, resulted in the belittling of the written drama, with the notable exception of the parodistic wit of W.S. Gilbert (1836–1911). It is worth noting, however, that the most successful modern "musicals" lean heavily on their literary sources. Today, two of the strongest influences on contemporary theatre are those of Bertolt Brecht, who believed that a dialectical theatre should employ music not merely as a background embellishment but as an equal voice with the actor's, and of Antonin Artaud, who argued that the theatre experience should subordinate the literary text to mime, music, and spectacle. Since it is evident that drama often involves a balance of the arts, an understanding of their interrelationships is proper to a study of dramatic literature.

The influence of theatre design. Though apparently an elementary matter, the shape of the stage and auditorium probably offers the greatest single control over the text of the play that can be measured and tested. Moreover, it is arguable that the playhouse architecture dictates more than any other single factor the style of a play, the conventions of its acting, and the quality of dramatic effect felt by its audience. The shape of the theatre is always changing, so that to investigate its function is both to understand the past and to anticipate the future. Today, Western theatre is in the process of breaking away from the dominance of the Victorian picture-frame theatre, and therefore from the kind of experience this produced.

The contemporary English critic John Wain has called the difference between Victorian and Elizabethan theatre a difference between "consumer" and "participation" art. The difference resulted from the physical relationship between the audience and the actor in the two periods, a relationship that determined the kind of communication open to the playwright and the role the drama could play in society. Three basic playhouse shapes have emerged in the history of the theatre: the arena stage, the open stage, and the picture-frame.

Three basic playhouse types

The arena stage. To the arena, or theatre-in-the-round, belongs the excitement of the circus, the bullring, and such sports as boxing and wrestling. Arena performance was the basis for all early forms of theatre—the Druid ceremonies at Stonehenge, the Tibetan harvest-festival drama, probably early Greek ritual dancing in the *orchēstra*, the medieval rounds in 14th-century England and France, the medieval street plays on pageant wagons, the early Nō drama of Japan, the royal theatre of Cambodia. Characteristic of all these theatres is the bringing together of whole communities for a ritual experience; therefore, a sense of ritualistic intimacy and involvement is common to the content of the drama, and only the size of the audience changes the scale of the sung or spoken poetry. Clearly, the idiom of realistic dialogue would have been inappropriate both to the occasion and the manner of such theatre.

The open stage. When more narrative forms of action appeared in drama and particular singers or speakers needed to control the attention of their audience by facing them, the open, "thrust," or platform stage, with the audience on three sides of the actor, quickly developed its versatility. Intimate and ritualistic qualities in the drama could be combined with a new focus on the players as individual characters. The open stage and its variants were used by the majority of great national theatres, particularly those of China and Japan, the booths of the Italian commedia, the Elizabethan public and private playhouses, and the Spanish *corrales* (*i.e.*, the areas between town houses) of the Renaissance. While open-stage performance discouraged scenic elaboration, it stressed the actor and his role, his playing to and away from the spectators, with the consequent subtleties of empathy and alienation. It permitted high style in speech and behaviour, yet it could also accommodate moments of the colloquial and the realistic. It encouraged a drama of range and versatility, with rapid changes of mood and great flexibility of tone. It is not surprising that in the 20th century the West has seen a return to the open stage and that recent plays of Brechtian theatre and the theatre of the absurd seem composed for open staging.

The proscenium stage. The third basic theatre form is that of the proscenium-arch or picture-frame stage, which reached its highest achievements in the late 19th century. Not until public theatres were roofed, the actors withdrawn into the scene, and the stage artificially illuminated were conditions ripe in Western theatre for a new development of spectacle and illusion. This development had a revolutionary effect upon the literary drama. In the 18th and 19th centuries, plays were shaped into a new structure of acts and scenes, with intermissions to permit scene changes. Only recently has the development of lighting techniques encouraged a return to a more flexible episodic drama. Of more importance, the actor increasingly withdrew into the created illusion of the play, and his character became part of it. In the mid-19th century, when it was possible to dim the house lights, the illusion could be made virtually complete. At its best, stage illusion could produce the delicate naturalism of a Chekhovian family scene, into which the spectator was drawn by understanding, sympathy, and recognition; at its worst, the magic of spectacle and the necessary projection of the speech and acting in the largest picture-frame theatres produced a crude drama of sensation in which literary values had no place.

Audience expectations. It may be that the primary influence upon the conception and creation of a play is that of the audience. An audience allows a play to have only the emotion and meaning it chooses, or else it defends itself either by protest or by a closed mind. From the time the spectator began paying for his playgoing, during the Renaissance, the audience more and more entered into the choice of the drama's subjects and their treatment. This is not to say that the audience was given no consideration earlier; even in medieval plays there were popular non-biblical roles such as Noah's wife, or Mak the sheepthief among the three shepherds, and the antic devils of the Harrowing of Hell in the English mystery cycles. Nor, in later times, did a good playwright always give the audience only what it expected—Shakespeare's *King Lear* (*c.* 1605), for example, in the view of many the world's greatest play, had its popular elements of folktale, intrigue, disguise, madness, clowning, blood, and horror; but each was turned by the playwright to the advantage of his theme.

Any examination of the society an audience represents must illuminate not only the cultural role of its theatre but also the content, genre, and style of its plays. The exceptionally aristocratic composition of the English Restoration audience, for example, illuminates the social game its comedy represented, and the middle class composition of the subsequent Georgian audience sheds light on the moralistic elements of its "sentimental" comedy. Not unrelated is the study of received ideas in the theatre. The widespread knowledge of simple Freudian psychology has undoubtedly granted a contemporary playwright like Tennessee Williams (1911–83) the license to invoke it for character motivation; and Brecht increasingly informed his comedies with Marxist thinking on the assumption that the audiences he wrote for would appreciate his dramatized argument. Things go wrong when the intellectual or religious background of the audience does not permit a shared experience, as when Jean-Paul Sartre (1905–80) could not persuade a predominantly Christian audience with an existentialist explanation for the action of his plays, or when T.S. Eliot (1888–1965) failed to persuade an audience accustomed to the conventions of drawing-room comedy that *The Cocktail Party* (1949) was a possible setting for Christian martyrdom. Good drama persuades before it preaches, but it can only begin where the audience begins.

Special audiences. A great variety of drama has been written for special audiences. Plays have been written for children, largely in the 20th century, though Nativity plays have always been associated with children both as performers and as spectators. These plays tend to be fanciful in conception, broad in characterization, and moralistic in intention. Nevertheless, the most famous of children's plays, James Barrie's *Peter Pan* (1904), implied that the young are no fools and celebrated children in their own right. Barrie submerged his point subtly beneath the fantasy, and his play is still regularly performed, while Maurice Maeterlinck's *Blue Bird* (1908) has disappeared from the repertory because of its weighty moral tone.

Children's drama

In the wider field of adult drama, the social class of the audience often accounts for a play's form and style. Court or aristocratic drama is readily distinguished from that of the popular theatre. The veneration in which the Nō drama was held in Japan derived in large part from the feudal ceremony of its presentation, and its courtly elements ensured its survival for an upper class and intellectual elite. Although much of it derived from the Nō, the flourishing of the Kabuki at the end of the 17th century is related to the rise of a new merchant and middle class audience, which encouraged the development of less esoteric drama. The popular plays of the Elizabethan public theatres, with their broader, more romantic subjects liberally spiced with comedy, are similarly to be contrasted with those of the private theatres. The boys' companies of the private theatres of Elizabethan London played for a better paying and more sophisticated audience, which favoured the satirical or philosophical plays of Thomas Middleton (1570?–1627), John Marston (1576–1634), and George Chapman (1559?–1634). Similarly today, in all Western dramatic media—stage, film, radio, and television—popular and "commercial" forms run alongside more "cultural" and avant-garde forms, so that the drama, which in its origins brought people together, now divides them. Whether the esoteric influences the popular theatre, or vice versa, is not clear, and research remains to be done on whether

this dichotomy is good or bad for dramatic literature or the people it is written for.

THE RANGE OF DRAMATIC FORMS AND STYLES

Dramatic literature has a remarkable facility in bringing together elements from other performing and nonperforming arts: design and mime, dance and music, poetry and narrative. It may be that the dramatic impulse itself, the desire to recreate a picture of life for others through impersonation, is at the root of all the arts. Certainly, the performing arts continually have need of dramatic literature to support them. A common way of describing an opera, for example, is to say that it is a play set to music. In Wagner the music is continuous; in Verdi the music is broken into songs; in Mozart the songs are separated by recitative, a mixture of speech and song; while operettas and musical comedy consist of speech that breaks into song from time to time. All forms of opera, however, essentially dramatize a plot, even if the plot must be simplified on the operatic stage. This is because, in opera, musical conventions dominate the dramatic conventions, and the spectator who finds that the music spoils the play, or who finds that the play spoils the music, is one who has not accepted the special conventions of opera. Music is drama's natural sister; proof may be seen in the early religious music-drama of the Dionysiac festivals of Greece and the *mystères* of 14th-century France, as well as in the remarkable development of opera in 17th-century Italy spreading to the rest of the world. The librettist who writes the text of an opera, however, must usually subserve the composer, unless he is able to embellish his play with popular lyrics, as John Gay did in *The Beggar's Opera* (1728), or to work in exceptionally close collaboration with the composer, as Brecht did with Kurt Weill for his *Die Dreigroschenoper* (*The Threepenny Opera,* 1928).

Opera

Dance, with its modern, sophisticated forms of ballet, has also been traditionally associated with dramatic representation and has similarly changed its purpose from religious to secular. In ballet, the music is usually central, and the performance is conceived visually and aurally; hence, the writer does not play a dominant role. The scenario is prepared for dance and mime by the choreographer. The contemporary Irish writer Samuel Beckett, trying to reduce his dramatic statement to the barest essentials, "composed" two mimes entitled *Act Without Words I* and *II* (1957 and 1966), but this is exceptional.

In motion pictures, the script writer has a more important but still not dominant role. He usually provides a loose outline of dialogue, business, and camera work on which the director, his cameramen, and the cutting editor build the finished product. The director is usually the final artistic authority and the central creative mind in the process, and words are usually subordinate to the dynamic visual imagery. (This subject is developed at length in the article MOTION PICTURES.)

The media of radio and television both depend upon words in their drama to an extent that is not characteristic of the motion picture. Though these mass media have been dominated by commercial interests and other economic factors, they also have developed dramatic forms from the special nature of their medium. The writer of a radio play must acknowledge that the listener cannot see the actors but hears them in conditions of great intimacy. A radio script that stresses the suggestive, imaginative, or poetic quality of words and permits a more than conventional freedom with time and place can produce a truly poetic drama, perhaps making unobtrusive use of earlier devices like the chorus, the narrator, and the soliloquy: the outstanding example of radio drama is *Under Milk Wood* (1953), by the Welsh poet Dylan Thomas.

A similar kind of dramatic writing is the so-called readers' theatre, in which actors read or recite without decor before an audience. (This is not to be confused with "closet drama," often a dramatic poem that assumes dialogue form; *e.g.,* Milton's *Samson Agonistes,* 1671, written without the intention of stage performance.) The essential discipline of the circuit of communication with an audience is what distinguishes drama as a genre, however many forms it has taken in its long history. (J.L.S.)

Comedy

The classic conception of comedy, which began with Aristotle in ancient Greece of the 4th century BC and persists through the present, holds that it is primarily concerned with man as a social being, rather than as a private person, and that its function is frankly corrective. The comic artist's purpose is to hold a mirror up to society to reflect its follies and vices, in the hope that they will, as a result, be mended. The 20th-century French philosopher Henri Bergson shared this view of the corrective purpose of laughter; specifically, he felt, laughter is intended to bring the comic character back into conformity with his society, whose logic and conventions he abandons when "he slackens in the attention that is due to life." Here comedy is considered primarily as a literary genre, but also is considered for its manifestations in the other arts. The wellsprings of comedy are dealt with in the article HUMOUR AND WIT. The comic impulse in the visual arts is discussed in CARICATURE, CARTOON, AND COMIC STRIP.

The corrective purpose of laughter

ORIGINS AND DEFINITIONS

The word comedy seems to be connected by derivation with the Greek verb meaning "to revel," and comedy arose out of the revels associated with the rites of Dionysus, a god of vegetation. The origins of comedy are thus bound up with vegetation ritual. Aristotle, in his *Poetics,* states that comedy originated in phallic songs and that, like tragedy, it began in improvisation. Though tragedy evolved by stages that can be traced, the progress of comedy passed unnoticed because it was not taken seriously. When tragedy and comedy arose, poets wrote one or the other, according to their natural bent. Those of the graver sort, who might previously have been inclined to celebrate the actions of the great in epic poetry, turned to tragedy; poets of a lower type, who had set forth the doings of the ignoble in invectives, turned to comedy. The distinction is basic to the Aristotelian differentiation between tragedy and comedy: tragedy imitates men who are better than the average, and comedy men who are worse.

For centuries, efforts at defining comedy were to be along the lines set down by Aristotle: the view that tragedy deals with personages of high estate, and comedy deals with lowly types; that tragedy treats of matters of great public import, while comedy is concerned with the private affairs of mundane life; and that the characters and events of tragedy are historic and so, in some sense, true, while the humbler materials of comedy are but feigned. Implicit, too, in Aristotle is the distinction in styles deemed appropriate to the treatment of tragic and comic story. As long as there was at least a theoretical separation of comic and tragic styles, either genre could, on occasion, appropriate the stylistic manner of the other to a striking effect, which was never possible after the crossing of stylistic lines became commonplace. The ancient Roman poet Horace, who wrote on such stylistic differences, noted the special effects that can be achieved when comedy lifts its voice in pseudotragic rant and when tragedy adopts the prosaic but affecting language of comedy. Consciously combined, the mixture of styles produces the burlesque, in which the grand manner (epic or tragic) is applied to a trivial subject, or the serious subject is subjected to a vulgar treatment, to ludicrous effect. The English novelist Henry Fielding, in the preface to *Joseph Andrews* (1742), was careful to distinguish between the comic and the burlesque; the latter centres on the monstrous and unnatural and gives pleasure through the surprising absurdity it exhibits in appropriating the manners of the highest to the lowest, or vice versa. Comedy, on the other hand, confines itself to the imitation of nature, and, according to Fielding, the comic artist is not to be excused for deviating from it. His subject is the ridiculous, not the monstrous, as with the writer of burlesque; and the nature he is to imitate is human nature, as viewed in the ordinary scenes of civilized society.

Distinction between the comic and the burlesque

The human contradiction. In dealing with man as a social being, all great comic artists have known that they are in the presence of a contradiction: that behind the social being lurks an animal being, whose behaviour of-

ten accords very ill with the canons dictated by society. Comedy, from its ritual beginnings, has celebrated creative energy. The primitive revels out of which comedy arose frankly acknowledged man's animal nature; the animal masquerades and the phallic processions are the obvious witnesses to it. Comedy testifies to man's physical vitality, his delight in life, his will to go on living. Comedy is at its merriest, its most festive, when this rhythm of life can be affirmed within the civilized context of human society. In the absence of this sort of harmony between creatural instincts and the dictates of civilization, sundry strains and discontents arise, all baring witness to the contradictory nature of man, which in the comic view is a radical dualism; his efforts to follow the way of rational sobriety are forever being interrupted by the infirmities of the flesh. The duality that tragedy views as a fatal contradiction in the nature of things comedy views as one more instance of the incongruous reality that every man must live with as best he can. "Wherever there is life, there is contradiction," says Søren Kierkegaard, the 19th-century Danish Existentialist, in the *Concluding Unscientific Postscript* (1846), "and wherever there is contradiction, the comical is present." He went on to say that the tragic and the comic are both based on contradiction; but "the tragic is the suffering contradiction, comical, painless contradiction." Comedy makes the contradiction manifest along with a way out, which is why the contradiction is painless. Tragedy, on the other hand, despairs of a way out of the contradiction.

The incongruous is "the essence of the laughable," said the English essayist William Hazlitt, who also declared, in his essay "On Wit and Humour" in *English Comic Writers* (1819), that "Man is the only animal that laughs and weeps; for he is the only animal that is struck with the difference between what things are, and what they ought to be."

The ironic view of man

Comedy, satire, and romance. Comedy's dualistic view of man as an incongruous mixture of bodily instinct and rational intellect is an essentially ironic view—implying the capacity to see things in a double aspect. The comic drama takes on the features of satire as it fixes on professions of virtue and the practices that contradict them. Satire assumes standards against which professions and practices are judged. To the extent that the professions prove hollow and the practices vicious, the ironic perception darkens and deepens. The element of the incongruous points in the direction of the grotesque, which implies an admixture of elements that do not match. The ironic gaze eventually penetrates to a vision of the grotesque quality of experience, marked by the discontinuity of word and deed and the total lack of coherence between appearance and reality. This suggests one of the extreme limits of comedy, the satiric extreme, in which the sense of the discrepancy between things as they are and things as they might be or ought to be has reached to the borders of tragedy. For the tragic apprehension, as Kierkegaard states, despairs of a way out of the contradictions that life presents.

As satire may be said to govern the movement of comedy in one direction, romance governs its movement in the other. Satiric comedy dramatizes the discrepancy between the ideal and the reality and condemns the pretensions that would mask reality's hollowness and viciousness. Romantic comedy also regularly presents the conflict between the ideal shape of things as hero or heroine could wish them to be and the hard realities with which they are confronted, but typically it ends by invoking the ideal, despite whatever difficulties reality has put in its way. This is never managed without a good deal of contrivance, and the plot of the typical romantic comedy is a medley of clever scheming, calculated coincidence, and wondrous discovery, all of which contribute ultimately to making the events answer precisely to the hero's or heroine's wishes. Plotting of this sort has had a long stage tradition and not exclusively in comedy. It is first encountered in the tragicomedies of the ancient Greek dramatist Euripides (*e.g., Alcestis, Iphigeneia in Tauris, Ion, Helen*). Shakespeare explored the full range of dramatic possibilities of the romantic mode of comedy. The means by which the happy ending is accomplished in romantic comedy—the document or the bodily mark that establishes identities to the satisfaction of all the characters of goodwill—are part of the stock-in-trade of all comic dramatists, even such 20th-century playwrights as Jean Anouilh (in *Le Voyageur sans bagage*) and T.S. Eliot (in *The Confidential Clerk*).

There is nothing necessarily inconsistent in the use of a calculatedly artificial dramatic design to convey a serious dramatic statement. The contrived artifice of Shakespeare's mature comic plots is the perfect foil against which the reality of the characters' feelings and attitudes assumes the greater naturalness. The strange coincidences, remarkable discoveries, and wonderful reunions are unimportant compared with the emotions of relief and awe that they inspire. Their function, as Shakespeare uses them, is precisely to give rise to such emotions, and the emotions, thanks to the plangent poetry in which they are expressed, end by transcending the circumstances that occasioned them. But when such artifices are employed simply for the purpose of eliminating the obstacles to a happy ending—as is the case in the sentimental comedy of the 18th and early 19th centuries—then they stand forth as imaginatively impoverished dramatic clichés. The dramatists of sentimental comedy were committed to writing exemplary plays, wherein virtue would be rewarded and vice frustrated. If hero and heroine were to be rescued from the distresses that had encompassed them, any measures were apparently acceptable; the important thing was that the play's action should reach an edifying end. It is but a short step from comedy of this sort to the melodrama that flourished in the 19th-century theatre. The distresses that the hero and heroine suffer are, in melodrama, raised to a more than comic urgency, but the means of deliverance have the familiar comic stamp: the secret at last made known, the long-lost child identified, the hard heart made suddenly capable of pity. Melodrama is a form of fantasy that proceeds according to its own childish and somewhat egoistic logic; hero and heroine are pure, anyone who opposes them is a villain, and the purity that has exposed them to risks must ensure their eventual safety and happiness. What melodrama is to tragedy farce is to comedy, and the element of fantasy is equally prominent in farce and in melodrama. If melodrama provides a fantasy in which the protagonist suffers for his virtues but is eventually rewarded for them, farce provides a fantasy in which the protagonist sets about satisfying his most roguish or wanton, mischievous or destructive, impulses and manages to do so with impunity.

19th-century melodrama

THEORIES

The treatise that Aristotle is presumed to have written on comedy is lost. There is, however, a fragmentary treatise on comedy that bears an obvious relation to Aristotle's treatise on tragedy, *Poetics*, and is generally taken to be either a version of a lost Aristotelian original or an expression of the philosophical tradition to which he belonged. This is the *Tractatus Coislinianus*, preserved in a 10th-century manuscript in the De Coislin Collection in Paris. The *Tractatus* divides the substance of comedy into the same six elements that are discussed in regard to tragedy in the *Poetics:* plot, character, thought, diction, melody, and spectacle. The characters of comedy, according to the *Tractatus*, are of three kinds: the impostors, the self-deprecators, and the buffoons. The Aristotelian tradition from which the *Tractatus* derives probably provided a fourth, the churl, or boor. The list of comic characters in the *Tractatus* is closely related to a passage in Aristotle's *Nicomachean Ethics*, in which the boaster (the person who says more than the truth) is compared with the mock-modest man (the person who says less), and the buffoon (who has too much wit) is contrasted with the boor (who has too little).

Comedy as a rite. The *Tractatus* was not printed until 1839, and its influence on comic theory is thus of relatively modern date. It is frequently cited in the studies that attempt to combine literary criticism and anthropology, in the manner in which Sir James George Frazer combined studies of primitive religion and culture in *The Golden Bough* (1890–1915). In such works, comedy and tragedy alike are traced to a prehistoric death-and-resurrection

ceremonial, a seasonal pantomime in which the old year, in the guise of an aged king (or hero or god), is killed, and the new spirit of fertility, the resurrection or initiation of the young king, is brought in. This rite typically featured a ritual combat, or agon, between the representatives of the old and the new seasons, a feast in which the sacrificial body of the slain king was devoured, a marriage between the victorious new king and his chosen bride, and a final triumphal procession in celebration of the reincarnation or resurrection of the slain god. Implicit in the whole ceremony is the ancient rite of purging the tribe through the expulsion of a scapegoat, who carries away the accumulated sins of the past year. Frazer, speaking of scapegoats in *The Golden Bough,* noted that this expulsion of devils was commonly preceded or followed by a period of general license, an abandonment of the ordinary restraints of society during which all offenses except the gravest go unpunished. This quality of Saturnalia is characteristic of comedy from ancient Greece through medieval Europe.

The role of the scapegoats

The seasonal rites that celebrate the yearly cycle of birth, death, and rebirth are seen by the contemporary Canadian critic Northrop Frye as the basis for the generic plots of comedy, romance, tragedy, and irony and satire. The four prefigure the fate of a hero and the society he brings into being. In comedy (representing the season of spring), the hero appears in a society controlled by obstructing characters and succeeds in wresting it from their grasp. The movement of comedy of this sort typically replaces falsehood with truth, illusion with reality. The hero, having come into possession of his new society, sets forth upon adventures, and these are the province of romance (summer). Tragedy (autumn) commemorates the hero's passion and death. Irony and satire (winter) depict a world from which the hero has disappeared, a vision of "unidealized existence." With spring, the hero is born anew.

The moral force of comedy. The characters of comedy specified in the *Tractatus* arrange themselves in a familiar pattern: a clever hero is surrounded by fools of sundry varieties (impostors, buffoons, boors). The hero is something of a trickster; he dissimulates his own powers, while exploiting the weaknesses of those around him. The comic pattern is a persistent one; it appears not only in ancient Greek comedy but also in the farces of ancient Italy, in the commedia dell'arte that came into being in 16th-century Italy, and even in the routines involving a comedian and his straight man in the nightclub acts and the television variety shows of the present time. Implicit here is the tendency to make folly ridiculous, to laugh it out of countenance, which has always been a prominent feature of comedy.

Renaissance critics, elaborating on the brief and cryptic account of comedy in Aristotle's *Poetics,* stressed the derisive force of comedy as an adjunct to morality. The Italian scholar Gian Giorgio Trissino's account of comedy in his *Poetica,* apparently written in the 1530s, is typical: as tragedy teaches by means of pity and fear, comedy teaches by deriding things that are vile. Attention is directed here, as in other critical treatises of this kind, to the source of laughter. According to Trissino, laughter is aroused by objects that are in some way ugly and especially by that from which better qualities were hoped. His statement suggests the relation of the comic to the incongruous. Trissino was as aware as the French poet Charles Baudelaire was three centuries later that laughter betokens the fallen nature of man (Baudelaire would term it man's Satanic nature). Man laughs, says Trissino (echoing Plato's dialogue *Philebus*), because he is envious and malicious and never delights in the good of others except when he hopes for some good from it for himself.

The most important English Renaissance statement concerning comedy is that of Sir Philip Sidney in *The Defence of Poesie* (1595):

Sir Philip Sidney's definition of comedy

> comedy is an imitation of the common errors of our life, which [the comic dramatist] representeth in the most ridiculous and scornful sort that may be, so as it is impossible that any beholder can be content to be such a one.

Like Trissino, Sidney notes that, while laughter comes from delight, not all objects of delight cause laughter, and he demonstrates the distinction as Trissino had done: "we are ravished with delight to see a fair woman, and yet are far from being moved to laughter. We laugh at deformed creatures, wherein certainly we cannot delight." The element of the incongruous is prominent in Sidney's account of scornful laughter. He cites the image of the hero of Greek legend Heracles, with his great beard and furious countenance, in woman's attire, spinning at the command of his beloved queen, Omphale, and declares that this arouses both delight and laughter.

Comedy and character. Another English poet, John Dryden, in *Of Dramatick Poesie, an Essay* (1668), makes the same point in describing the kind of laughter produced by the ancient Greek comedy *The Clouds,* by Aristophanes. In it, the character of Socrates is made ridiculous by acting very unlike the true Socrates; that is, by appearing childish and absurd rather than with the gravity of the true Socrates. Dryden was concerned with analyzing the laughable quality of comedy and with demonstrating the different forms it has taken in different periods of dramatic history. Aristophanic comedy sought its laughable quality not so much in the imitation of a man as in the representation of "some odd conceit which had commonly somewhat of unnatural or obscene in it." In the so-called New Comedy, introduced by Menander late in the 4th century BC, writers sought to express the ethos, or character, as in their tragedies they expressed the pathos, or suffering, of mankind. This distinction goes back to Aristotle, who, in the *Rhetoric,* distinguished between ethos, a man's natural bent, disposition, or moral character, and pathos, emotion displayed in a given situation. And the Latin rhetorician Quintilian, in the 1st century AD, noted that ethos is akin to comedy and pathos to tragedy. The distinction is important to Renaissance and Neoclassical assumptions concerning the respective subject of comic and tragic representation. In terms of emotion, ethos is viewed as a permanent condition characteristic of the average man and relatively mild in its nature; pathos, on the other hand, is a temporary emotional state, often violent. Comedy thus expresses the characters of men in the ordinary circumstances of everyday life; tragedy expresses the sufferings of a particular man in extraordinary periods of intense emotion.

In dealing with men engaged in normal affairs, the comic dramatists tended to depict the individual in terms of some single but overriding personal trait or habit. They adopted a method based on the physiological concept of the four humours, or bodily fluids (blood, phlegm, choler, melancholy), and the belief that an equal proportion of these constituted health, while an excess or deficiency of any one of them brought disease. Since the humours governed temperament, an irregular distribution of them was considered to result not only in bodily sickness but also in derangements of personality and behaviour, as well. The resultant comedy of humours is distinctly English, as Dryden notes, and particularly identified with the comedies of Ben Jonson.

English comedy of humours

The role of wit. Humour is native to man. Folly need only be observed and imitated by the comic dramatist to give rise to laughter. Observers as early as Quintilian, however, have pointed out that, though folly is laughable in itself, such jests may be improved if the writer adds something of his own; namely, wit. A form of repartee, wit implies both a mental agility and a linguistic grace that is very much a product of conscious art. Quintilian describes wit at some length in his *Institutio oratoria;* it partakes of urbanity, a certain tincture of learning, charm, saltiness, or sharpness, and polish and elegance. In the preface (1671) to *An Evening's Love,* Dryden distinguishes between the comic talents of Ben Jonson, on the one hand, and of Shakespeare and his contemporary John Fletcher, on the other, by virtue of their excelling, respectively, in humour and wit. Jonson's talent lay in his ability "to make men appear pleasantly ridiculous on the stage"; while Shakespeare and Fletcher excelled in wit, or "the sharpness of conceit," as seen in their repartee. The distinction is noted as well in *Of Dramatick Poesie, an Essay,* where a comparison is made between the character of Morose in Jonson's play *Epicœne,* who is characterized by his

humour (namely, his inability to abide any noise but the sound of his own voice), and Shakespeare's Falstaff, who, according to Dryden, represents a miscellany of humours and is singular in saying things that are unexpected by the audience.

The distinctions that Hazlitt arrives at, then, in his essay "On Wit and Humour" are very much in the classic tradition of comic criticism:

> Humour is the describing the ludicrous as it is in itself; wit is the exposing it, by comparing or contrasting it with something else. Humour is, as it were, the growth of nature and accident: wit is the product of art and fancy.

The distinctions persist into the most sophisticated treatments of the subject. Sigmund Freud, for example, in *Wit and its Relation to the Unconscious* (1905), said that wit is made, but humour is found. Laughter, according to Freud, is aroused at actions that appear immoderate and inappropriate, at excessive expenditures of energy: it expresses a pleasurable sense of the superiority felt on such occasions.

Baudelaire on the grotesque. The view that laughter comes from superiority is referred to as a commonplace by Baudelaire, who states it in his essay "On the Essence of Laughter" (1855). Laughter, says Baudelaire, is a consequence of man's notion of his own superiority. It is a token both of an infinite misery, in relation to the absolute being of whom man has an inkling, and of infinite grandeur, in relation to the beasts, and results from the perpetual collision of these two infinities. The crucial part of Baudelaire's essay, however, turns on his distinction between the comic and the grotesque. The comic, he says, is an imitation mixed with a certain creative faculty; the grotesque is a creation mixed with a certain imitative faculty—imitative of elements found in nature. Each gives rise to laughter expressive of an idea of superiority—in the comic, the superiority of man over man, and, in the grotesque, the superiority of man over nature. The laughter caused by the grotesque has about it something more profound and primitive, something much closer to the innocent life, than has the laughter caused by the comic in man's behaviour. In France, the great master of the grotesque was the 16th-century author François Rabelais, while some of the plays of Molière, in the next century, best expressed the comic.

Baudelaire's definition of laughter

Bergson's and Meredith's theories. The French philosopher Henri Bergson (1859–1941) analyzed the dialectic of comedy in his essay "Laughter," which deals directly with the spirit of contradiction that is basic both to comedy and to life. Bergson's central concern is with the opposition of the mechanical and the living; stated in its most general terms, his thesis holds that the comic consists of something mechanical encrusted on the living. Bergson traces the implications of this view in the sundry elements of comedy: situations, language, characters. Comedy expresses a lack of adaptability to society; any individual is comic who goes his own way without troubling to get into touch with his fellow beings. The purpose of laughter is to wake him from his dream. Three conditions are essential for the comic: the character must be unsociable, for that is enough to make him ludicrous; the spectator must be insensible to the character's condition, for laughter is incompatible with emotion; and the character must act automatically (Bergson cites the systematic absentmindedness of Don Quixote). The essential difference between comedy and tragedy, says Bergson, invoking a distinction that goes back to that maintained between ethos and pathos, is that tragedy is concerned with individuals and comedy with classes. And the reason that comedy deals with the general is bound up with the corrective aim of laughter: the correction must reach as great a number of persons as possible. To this end, comedy focusses on peculiarities that are not indissolubly bound up with the individuality of a single person.

It is the business of laughter to repress any tendency on the part of the individual to separate himself from society. The comic character would, if left to his own devices, break away from logic (and thus relieve himself from the strain of thinking); give over the effort to adapt and readapt himself to society (and thus slacken in the attention that is due to life); and abandon social convention (and thus relieve himself from the strain of living).

The essay "On the Idea of Comedy and the Uses of the Comic Spirit" (1877), by Bergson's English contemporary George Meredith, is a celebration of the civilizing power of the comic spirit. The mind, he affirms, directs the laughter of comedy, and civilization is founded in common sense, which equips one to hear the comic spirit when it laughs folly out of countenance and to participate in its fellowship.

Both Bergson's and Meredith's essays have been criticized for focussing so exclusively on comedy as a socially corrective force and for limiting the scope of laughter to its derisive power. The charge is more damaging to Meredith's essay than it is to Bergson's. Whatever the limitations of the latter, it nonetheless explores the implications of its own thesis with the utmost thoroughness, and the result is a rigorous analysis of comic causes and effects for which any student of the subject must be grateful. It is with farce that Bergson's remarks on comedy have the greatest connection and on which they seem chiefly to have been founded. It is no accident that most of his examples are drawn from Molière, in whose work the farcical element is strong, and from the farces of Bergson's own contemporary Eugène Labiche. The laughter of comedy is not always derisive, however, as some of Shakespeare's greatest comedies prove; and there are plays, such as Shakespeare's last ones, which are well within an established tradition of comedy but in which laughter hardly sounds at all. These suggest regions of comedy on which Bergson's analysis of the genre sheds hardly any light at all.

The laughter of comedy

The comic as a failure of self-knowledge. Aristotle said that comedy deals with the ridiculous, and Plato, in the *Philebus*, defined the ridiculous as a failure of self-knowledge: such a failure is there shown to be laughable in private individuals (the personages of comedy) but terrible in persons who wield power (the personages of tragedy). In comedy, the failure is often mirrored in a character's efforts to live up to an ideal of self that may be perfectly worthy but the wrong ideal for him. Shakespearean comedy is rich in examples: the King of Navarre and his courtiers, who must be made to realize that nature meant them to be lovers, not academicians, in *Love's Labour's Lost;* Beatrice and Benedick, who must be made to know that nature meant them for each other, not for the single life, in *Much Ado About Nothing;* the Duke Orsino in *Twelfth Night*, who is brought to see that it is not Lady Olivia whom he loves but the disguised Viola, and Lady Olivia herself, who, when the right man comes along, decides that she will not dedicate herself to seven years of mourning for a dead brother, after all; and Angelo in *Measure for Measure*, whose image of himself collapses when his lust for Isabella makes it clear that he is not the ascetic type. The movement of all these plays follows a familiar comic pattern, wherein characters are brought from a condition of affected folly amounting to self-delusion to a plain recognition of who they are and what they want. For the five years or so after he wrote *Measure for Measure*, in 1604, Shakespeare seems to have addressed himself exclusively to tragedy, and each play in the sequence of masterpieces he produced during this period—*Othello, King Lear, Macbeth, Antony and Cleopatra*, and *Coriolanus*—turns in some measure on a failure of self-knowledge. This is notably so in the case of *Lear*, which is the tragedy of a man who (in the words of one of his daughters) "hath ever but slenderly known himself," and whose fault (as the Fool suggests) is to have grown old before he grew wise.

The plots of Shakespeare's last plays (*Pericles, Cymbeline, The Winter's Tale, The Tempest*) all contain a potential tragedy but one that is resolved by nontragic means. They contain, as well, an element of romance of the kind purveyed from Greek New Comedy through the plays of the ancient Roman comic dramatists Plautus and Terence. Children lost at birth are miraculously restored, years later, to their parents, thereby providing occasion for a recognition scene that functions as the denouement of the plot. Characters find themselves—they come to know themselves—in all manner of ways by the ends of these

plays. Tragic errors have been made, tragic losses have been suffered, tragic passions—envy, jealousy, wrath—have seemed to rage unchecked, but the miracle that these plays celebrate lies in the discovery that the errors can be forgiven, the losses restored, and the passions mastered by man's godly spirit of reason. The near tragedies experienced by the characters result in the ultimate health and enlightenment of the soul. What is learned is of a profound simplicity: the need for patience under adversity, the need to repent of one's sins, the need to forgive the sins of others. In comedy of this high and sublime sort, patience, repentance, and forgiveness are opposed to the viciously circular pattern of crime, which begets vengeance, which begets more crime. Comedy of this sort deals in regeneration and rebirth. There is always about it something of the religious, as humankind is absolved of its guilt and reconciled one to another and to whatever powers that be.

Distinction between comedy and tragedy

Divine comedies in the West and East. The 4th-century Latin grammarian Donatus distinguished comedy from tragedy by the simplest terms: comedies begin in trouble and end in peace, while tragedies begin in calms and end in tempest. Such a differentiation of the two genres may be simplistic, but it provided sufficient grounds for Dante to call his great poem *La Commedia* (*The Comedy;* later called *The Divine Comedy*), since, as he says in his dedicatory letter, it begins amid the horrors of hell but ends amid the pleasures of heaven. This suggests the movement of Shakespeare's last plays, which begin amid the distresses of the world and end in a supernal peace. Comedy conceived in this sublime and serene mode is rare but recurrent in the history of the theatre. The Spanish dramatist Calderón's *Vida es sueño* (1635; "Life Is a Dream") is an example; so, on the operatic stage, is Mozart's *Magic Flute* (1791), in spirit and form so like Shakespeare's *Tempest,* to which it has often been compared. In later drama, Henrik Ibsen's *Little Eyolf* (1894) and August Strindberg's *To Damascus* (1898–1904)—both of which are among the late works of these Scandinavian dramatists—have affinities with this type, and this is the comic mode in which T.S. Eliot's last play, *The Elder Statesman* (1958), is conceived. It may represent the most universal mode of comedy. The American philosopher Susanne K. Langer writes:

> In Asia the designation "Divine Comedy" would fit numberless plays; especially in India triumphant gods, divine lovers united after various trials [as in the perennially popular romance of Rama and Sita], are the favourite themes of a theater that knows no "tragic rhythm." The classical Sanskrit drama was heroic comedy—high poetry, noble action, themes almost always taken from the myths—a serious, religiously conceived drama, yet in the "comic" pattern, which is not a complete organic development reaching a foregone, inevitable conclusion, but is episodic, restoring a lost balance, and implying a new future. The reason for this consistently "comic" image of life in India is obvious enough: both Hindu and Buddhist regard life as an episode in the much longer career of the soul which has to accomplish many incarnations before it reaches its goal, nirvana. Its struggles in the world do not exhaust it; in fact they are scarcely worth recording except in entertainment theater, "comedy" in our sense—satire, farce, and dialogue. The characters whose fortunes are seriously interesting are the eternal gods; and for them there is no death, no limit of potentialities, hence no fate to be fulfilled. There is only the balanced rhythm of sentience and emotion, upholding itself amid the changes of material nature. (From *Feeling and Form;* Charles Scribner's Sons, 1953.)

KINDS OF COMEDY IN DIVERSE HISTORICAL PERIODS

Old and New Comedy in ancient Greece. The 11 surviving plays of Aristophanes represent the earliest extant body of comic drama; what is known of Greek Old Comedy is derived from these plays, the earliest of which, *The Acharnians,* was produced in 425 BC. Aristophanic comedy has a distinct formal design but displays very little plot in any conventional sense. Rather, it presents a series of episodes aimed at illustrating, in humorous and often bawdy detail, the implications of a deadly serious political issue: it is a blend of invective, buffoonery, and song and dance. Old Comedy often used derision and scurrility, and this may have proved its undoing; though praised by all, the freedom it enjoyed degenerated into license and violence and had to be checked by law.

In New Comedy, which began to prevail around 336 BC, the Aristophanic depiction of public personages and events was replaced by a representation of the private affairs (usually amorous) of imaginary men and women. New Comedy is known only from the fragments that have survived of the plays of Menander (*c.* 342–*c.* 292 BC) and from plays written in imitation of the form by the Romans Plautus (*c.* 254–184 BC) and Terence (195 or 185–159 BC). A number of the stock comic characters survived from Old Comedy into New: an old man, a young man, an old woman, a young woman, a learned doctor or pedant, a cook, a parasite, a swaggering soldier, a comic slave. New Comedy, on the other hand, exhibits a degree of plot articulation never achieved in the Old. The action of New Comedy is usually about plotting; a clever servant, for example, devises ingenious intrigues in order that his young master may win the girl of his choice. There is satire in New Comedy: on a miser who loses his gold from being overcareful of it (the *Aulularia* of Plautus); on a father who tries so hard to win the girl from his son that he falls into a trap set for him by his wife (Plautus' *Casina*); and on an overstern father whose son turns out worse than the product of an indulgent parent (in the *Adelphi* of Terence). But the satiric quality of these plays is bland by comparison with the trenchant ridicule of Old Comedy. The emphasis in New Comic plotting is on the conduct of a love intrigue; the love element per se is often of the slightest, the girl whom the hero wishes to possess sometimes being no more than an offstage presence or, if onstage, a mute.

Development of stock characters

New Comedy provided the model for European comedy through the 18th century. During the Renaissance, the plays of Plautus and, especially, of Terence were studied for the moral instruction that young men could find in them: lessons on the need to avoid the snares of harlots and the company of braggarts, to govern the deceitful trickery of servants, to behave in a seemly and modest fashion to parents. Classical comedy was brought up to date in the plays of the "Christian Terence," imitations by schoolmasters of the comedies of the Roman dramatist. They added a contemporary flavour to the life portrayed and displayed a somewhat less indulgent attitude to youthful indiscretions than did the Roman comedy. New Comedy provided the basic conventions of plot and characterization for the *commedia erudita*—comedy performed from written texts—of 16th-century Italy, as in the plays of Machiavelli and Ariosto. Similarly, the stock characters that persisted from Old Comedy into New were taken over into the improvisational commedia dell'arte, becoming such standard masked characters as Pantalone, the Dottore, the vainglorious Capitano, the young lovers, and the servants, or *zanni.*

Rise of realistic comedy in 17th-century England. The early part of the 17th century in England saw the rise of a realistic mode of comedy based on a satiric observation of contemporary manners and mores. It was masterminded by Ben Jonson, and its purpose was didactic. Comedy, said Jonson in *Every Man Out of his Humour* (1599), quoting the definition that during the Renaissance was attributed to Cicero, is an imitation of life, a glass of custom, an image of truth. Comedy holds the mirror up to nature and reflects things as they are, to the end that society may recognize the extent of its shortcomings and the folly of its ways and set about its improvement. Jonson's greatest plays—*Volpone* (1606), *Epicœne* (1609), *The Alchemist* (1610), *Bartholomew Fair* (1614)—offer a richly detailed contemporary account of the follies and vices that are always with us. The setting (apart from *Volpone*) is Jonson's own London, and the characters are the ingenious or the devious or the grotesque products of the human wish to get ahead in the world. The conduct of a Jonsonian comic plot is in the hands of a clever manipulator who is out to make reality conform to his own desires. Sometimes he succeeds, as in the case of the clever young gentleman who gains his uncle's inheritance in *Epicœne* or the one who gains the rich Puritan widow for his wife in *Bartholomew Fair.* In *Volpone* and *The Alchemist,* the schemes eventually fail, but this is the fault of the manipulators, who will never stop when they are ahead, and not at all due to any

The rise of a realistic comedy

insight on the part of the victims. The victims are almost embarrassingly eager to be victimized. Each has his ruling passion—his humour—and it serves to set him more or less mechanically in the path that he will undeviatingly pursue, to his own discomfiture.

English comedy of the later 17th century is cast in the Jonsonian mold. Restoration comedy is always concerned with the same subject—the game of love—but the subject is treated as a critique of fashionable society. Its aim is distinctly satiric, and it is set forth in plots of Jonsonian complexity, where the principal intriguer is the rakish hero, bent on satisfying his sexual needs, outside the bonds of marriage, if possible. In the greatest of these comedies—Sir George Etherege's *Man of Mode* (1676), for example, or William Wycherley's *Country-Wife* (1675) or William Congreve's *Way of the World* (1700)—the premium is on the energy and the grace with which the game is played, and the highest dramatic approval is reserved for those who take the game seriously enough to play it with style but who have the good sense to know when it is played out. The satiric import of Restoration comedy resides in the dramatist's awareness of a familiar incongruity: that between the image of man in his primitive nature and the image of man amid the artificial restraints that society would impose upon him. The satirist in these plays is chiefly concerned with detailing the artful dodges that ladies and gentlemen employ to satisfy nature and to remain within the pale of social decorum. Inevitably, then, hypocrisy is the chief satiric target. The animal nature of man is taken for granted, and so is his social responsibility to keep up appearances; some hypocrisy must follow, and, within limits, society will wink at indiscretions so long as they are discreetly managed. The paradox is typical of those in which the Restoration comic dramatists delight; and the strongly rational and unidealistic ethos of this comedy has its affinities with the naturalistic and skeptical cast of late-17th-century philosophical thought.

Sentimental comedy of the 17th and 18th centuries. The Restoration comic style collapsed around the end of the 17th century, when the satiric vision gave place to a sentimental one. Jeremy Collier's *Short view of the Profaneness and Immorality of the English Stage,* published in 1698, signalled the public opposition to the real or fancied improprieties of plays staged during the previous three decades. "The business of plays is to recommend Vertue, and discountenance Vice": so runs the opening sentence of Collier's attack. No Restoration comic dramatist ever conceived of his function in quite these terms. "It is the business of a comic poet to paint the vices and follies of humankind," Congreve had written a few years earlier (in the dedication to *The Double-Dealer*). Though Congreve may be assumed to imply—in accordance with the time-honoured theory concerning the didactic end of comedy—that the comic dramatist paints the vices and follies of humankind for the purpose of correcting them through ridicule, he is, nonetheless, silent on this point. Collier's assumption that all plays must recommend virtue and discountenance vice has the effect of imposing on comedy the same sort of moral levy that critics such as Thomas Rymer were imposing on tragedy in their demand that it satisfy poetic justice.

The vogue of tragicomedy

At the beginning of the 18th century, there was a blending of the tragic and comic genres that, in one form or another, had been attempted throughout the preceding century. The vogue of tragicomedy may be said to have been launched in England with the publication of John Fletcher's *Faithfull Shepheardesse* (*c.* 1608), an imitation of the *Pastor fido,* by the Italian poet Battista Guarini. In his *Compendium of Tragicomic Poetry* (1601), Guarini had argued the distinct nature of the genre, maintaining it to be a third poetic kind, different from either the comic or the tragic. Tragicomedy, he wrote, takes from tragedy its great persons but not its great action, its movement of the feelings but not its disturbance of them, its pleasure but not its sadness, its danger but not its death; from comedy it takes laughter that is not excessive, modest amusement, feigned difficulty, and happy reversal. Fletcher adapted this statement in the address "To the Reader" that prefaces *The Faithfull Shepheardesse.*

The form quickly established itself on the English stage, and, through the force of such examples as Beaumont and Fletcher's *Phylaster* (1610) and *A King and No King* (1611) and a long sequence of Fletcher's unaided tragicomedies, it prevailed during the 20 years before the closing of the theatres in 1642. The taste for tragicomedy continued unabated at the Restoration, and its influence was so pervasive that during the closing decades of the century the form began to be seen in plays that were not, at least by authorial designation, tragicomedies. Its effect on tragedy can be seen not only in the tendency, always present on the English stage, to mix scenes of mirth with more solemn matters but also in the practice of providing tragedy with a double ending (a fortunate one for the virtuous, an unfortunate one for the vicious), as in Dryden's *Aureng-Zebe* (1675) or Congreve's *Mourning Bride* (1697). The general lines separating the tragic and comic genres began to break down, and that which is high, serious, and capable of arousing pathos could exist in the same play with what is low, ridiculous, and capable of arousing derision. The next step in the process came when Sir Richard Steele, bent on reforming comedy for didactic purposes, produced *The Conscious Lovers* (1722) and provided the English stage with an occasion when the audience at a comedy could derive its chief pleasure not from laughing but from weeping. It wept in the delight of seeing virtue rewarded and young love come to flower after parental opposition had been overcome. Comedy of the sort inaugurated by *The Conscious Lovers* continued to represent the affairs of private life, as comedy had always done, but with a seriousness hitherto unknown; and the traditionally low personages of comedy now had a capacity for feeling that bestowed on them a dignity previously reserved for the personages of tragedy.

The trend to egalitarianism

This trend in comedy was part of a wave of egalitarianism that swept through 18th-century political and social thought. It was matched by a corresponding trend in tragedy, which increasingly selected its subjects from the affairs of private men and women in ordinary life, rather than from the doings of the great. The German dramatist Gotthold Lessing wrote that the misfortunes of those whose circumstances most resemble those of the audience must naturally penetrate most deeply into its heart, and his own *Minna von Barnhelm* (1767) is an example of the new serious comedy. The capacity to feel, to sympathize with, and to be affected by the plight of a fellow human being without regard for his rank in the world's esteem became the measure of one's humanity. It was a bond that united the fraternity of mankind in an aesthetic revolution that preceded the political revolutions of the 18th century. In literature, this had the effect of hastening the movement toward a more realistic representation of reality, whereby the familiar events of common life are treated "seriously and problematically" (in the phrase of the critic Erich Auerbach, who traced the process in his book *Mimesis* [1946]). The results may be seen in novels such as Samuel Richardson's *Pamela* and *Clarissa* and in middle-class tragedies such as George Lillo's *The London Merchant* (1731) in England; in the *comédie larmoyante* ("tearful comedy") in France; in Carlo Goldoni's efforts to reform the commedia dell'arte and replace it with a more naturalistic comedy in the Italian theatre; and in the English sentimental comedy, exemplified in its full-blown state by plays such as Hugh Kelly's *False Delicacy* (1768) and Richard Cumberland's *West Indian* (1771). Concerning the sentimental comedy it must be noted that it is only in the matter of appropriating for the bourgeoisie a seriousness of tone and a dignity of representational style previously considered the exclusive property of the nobility that the form can be said to stand in any significant relationship to the development of a more realistic mimetic mode than the traditional tragic and comic ones. The plots of sentimental comedy are as contrived as anything in Plautus and Terence (which with their fondness for foundling heroes who turn out to be long-lost sons of rich merchants, they often resemble); and with their delicate feelings and genteel moral atmosphere, comedies of this sort seem as affected in matters of sentiment as Restoration comedy seems in matters of wit.

Goldsmith's views on sentimental comedy

Oliver Goldsmith, in his "A Comparison Between Laughing and Sentimental Comedy" (1773), noted the extent to which the comedy in the England of his day had departed from its traditional purpose, the excitation of laughter by exhibiting the follies of the lower part of mankind. He questioned whether an exhibition of its follies would not be preferable to a detail of its calamities. In sentimental comedy, Goldsmith continued, the virtues of private life were exhibited, rather than the vices exposed; and the distresses rather than the faults of mankind generated interest in the piece. Characters in these plays were almost always good; if they had faults, the spectator was expected not only to pardon but to applaud them, in consideration of the goodness of their hearts. Thus, according to Goldsmith, folly was commended instead of being ridiculed. Goldsmith concluded by labelling sentimental comedy a "species of bastard tragedy," "a kind of *mulish* production": a designation that ironically brings to mind Guarini's comparison of tragicomedy in its uniqueness (a product of comedy and tragedy but different from either) to the mule (the offspring of the horse and the ass but itself neither one nor the other). The production of Goldsmith's *She Stoops to Conquer* (1773) and of Richard Brinsley Sheridan's *Rivals* (1775) and *The School for Scandal* (1777) briefly reintroduced comic gaiety to the English stage; by the end of the decade, Sheridan's dramatic burlesque, *The Critic* (first performed 1779), had appeared, with its parody of contemporary dramatic fashions, the sentimental included. But this virtually concluded Sheridan's career as a dramatist; Goldsmith had died in 1774; and the sentimental play was to continue to govern the English comic stage for over a century to come.

The comic outside the theatre. The great comic voices of the 18th century in England were not those in the theatre. No dramatic satire of the period can exhibit anything comparable to the furious ridicule of man's triviality and viciousness that Jonathan Swift provided in *Gulliver's Travels* (1726). His *Modest Proposal* (1729) is a masterpiece of comic incongruity, with its suave blend of rational deliberation and savage conclusion. The comic artistry of Alexander Pope is equally impressive. Pope expressed his genius in the invective of his satiric portraits and in the range of moral and imaginative vision that was capable, at one end of his poetic scale, of conducting that most elegant of drawing-room epics, *The Rape of the Lock* (1712–14), to its sublimely inane conclusion and, at the other, of invoking from the scene that closes *The Dunciad* (1728) an apocalyptic judgment telling what will happen when the vulgarizers of the word have carried the day.

Censorship

When the voice of comedy did sound on the 18th-century English stage with anything approaching its full critical and satiric resonance, the officials soon silenced it. John Gay's *Beggar's Opera* (1728) combined hilarity with a satiric fierceness worthy of Swift (who may have suggested the original idea for it). The officials tolerated its spectacularly successful run, but no license from the lord chamberlain could be secured for Gay's sequel, *Polly*, which was not staged until 1777. The Licensing Act of 1737 ended the theatrical career of Henry Fielding, whose comedies had come under constant fire from the authorities for their satire on the government. Fielding's comic talents were perforce directed to the novel, the form in which he parodied the sentiment and the morality of Richardson's *Pamela*—in his *Shamela* and *Joseph Andrews* (1742)—as brilliantly as he had earlier burlesqued the rant of heroic tragedy in *Tom Thumb* (1730).

Comedy of the sort that ridicules the follies and vices of society to the end of laughing them out of countenance entered the English novel with Fielding. His statement in *Joseph Andrews* concerning the function of satire is squarely in the Neoclassic tradition of comedy as a corrective of manners and mores: the satirist holds

> the glass to thousands in their closets, that they may contemplate their deformity, and endeavour to reduce it, and thus by suffering private mortification may avoid public shame.

Fielding's scenes of contemporary life display the same power of social criticism as that which distinguishes the engravings of his great fellow artist William Hogarth, whose "Marriage à la Mode" (1745) depicts the vacuity and the casual wantonness of the fashionable world that Fielding treats of in the final books of *Tom Jones*. Hogarth's other series, such as "A Rake's Progress" (1735) or "A Harlot's Progress" (1732), also make a didactic point about the wages of sin, using realistic details heightened with grotesquerie to expose human frailty and its sinister consequences. The grotesque is a recurrent feature of the satiric tradition in England, where comedy serves social criticism. Artists such as Hogarth and Thomas Rowlandson worked in the tradition of Jonson and the Restoration dramatists in the preceding century.

The novel, with its larger scope for varied characters, scenes, and incidents, rather than the drama, afforded the 19th-century artist in comedy a literary form adequate to his role as social critic. The spectacle of man and his society is regularly presented by the 19th-century novelist in comedic terms, as in *Vanity Fair* (1848), by William Makepeace Thackeray or the *Comédie humaine* (1842–55) of Honoré de Balzac, and with the novels of Jane Austen, Anthony Trollope, Charles Dickens, and George Meredith.

20th-century tragicomedy. The best that the comic stage had to offer in the late 19th century lay in the domain of farce. The masters of this form were French, but it flourished in England as well; what the farces of Eugène Labiche and Georges Feydeau and the operettas of Jacques Offenbach were to the Parisian stage the farces of W.S. Gilbert and the young Arthur Wing Pinero and the operettas that Gilbert wrote in collaboration with Arthur Sullivan were to the London stage. As concerns comedy, the situation in England improved at the end of the century, when Oscar Wilde and George Bernard Shaw turned their talents to it. Wilde's *Importance of Being Earnest* (1895) is farce raised to the level of high comic burlesque. Shaw's choice of the comic form was inevitable, given his determination that the contemporary English stage should deal seriously and responsibly with the issues that were of crucial importance to contemporary English life. Serious subjects could not be resolved by means of the dramatic clichés of Victorian melodrama. Rather, the prevailing stereotypes concerning the nature of honour, courage, wisdom, and virtue were to be subjected to a hail of paradox, to the end of making evident their inner emptiness or the contradictions they concealed.

French farce

Shaw dealt with what, in the preface to *Major Barbara* (1905), he called "the tragi-comic irony of the conflict between real life and the romantic imagination," and his use of the word tragicomic is a sign of the times. The striking feature of modern art, according to the German novelist Thomas Mann, was that it had ceased to recognize the categories of tragic and comic or the dramatic classifications of tragedy and comedy but saw life as tragicomedy. The sense that tragicomedy is the only adequate dramatic form for projecting the unreconciled ironies of modern life mounted through the closing decades of the 19th century. Ibsen had termed *The Wild Duck* (published 1884) a tragicomedy; it was an appropriate designation for this bitter play about a young man blissfully ignorant of the lies on which he and his family have built their happy life until an outsider who is committed to an ideal of absolute truth exposes all their guilty secrets with disastrous results. The plays of the Russian writer Anton Chekhov, with their touching and often quite humorous figures leading lives of quiet desperation, reflect precisely that mixture of inarticulate joy and dull pain that is the essence of the tragicomic view of life.

A dramatist such as August Strindberg produces a kind of tragicomedy peculiarly his own, one that takes the form of bourgeois tragedy; it lacerates its principals until they become a parody of themselves. Strindberg's *Dance of Death* (1901), with its cruelty and pain dispensed with robust pleasure by a fiercely battling husband and wife, is a significant model of the grotesque in the modern theatre; it is reflected in such mid-20th-century examples of what came to be called black comedy as Eugène Ionesco's *Victims of Duty* (1953) and Edward Albee's *Who's Afraid of Virginia Woolf?* (1962). Almost equally influential as a turn-of-the-century master of the grotesque is Frank Wedekind, whose

Earth Spirit (1895) and its sequel, *Pandora's Box* (written 1892–1901), though both are termed tragedies by their author, are as much burlesques of tragedy as *The Dance of Death*. Their grotesquerie consists chiefly in their disturbing combination of innocence and depravity, of farce and horror, of passionate fervour issuing in ludicrous incident that turns deadly. Wedekind's celebration of primitive sexuality and the varied ways in which it manifests itself in an oversophisticated civilization distorts the tragic form to achieve its own grotesque beauty and power.

The great artist of the grotesque and of tragicomedy in the 20th century is the Italian Luigi Pirandello. His drama is explicitly addressed to the contradictoriness of experience: appearances collide and cancel out each other; the quest of the absolute issues in a mind-reeling relativism; infinite spiritual yearnings are brought up hard against finite physical limits; rational purpose is undermined by irrational impulse; and with the longing for permanence in the midst of change comes the ironic awareness that changelessness means death. Stated thus, Pirandello's themes sound almost forbiddingly intellectual, but one of his aims was to convert intellect into passion. Pirandello's characters suffer from intellectual dilemmas that give rise to mental and emotional distress of the most anguished kind, but their sufferings are placed in a satiric frame. The incongruities that the characters are furiously seeking to reconcile attest to the comic aspect of this drama, but there is nothing in it of the traditional movement of comedy, from a state of illusion into the full light of reality. Pirandello's characters dwell amid ambiguities and equivocations that those who are wise in the tragicomic nature of life will accept without close inquiry. The logic of comedy implies that illusions exist to be dispelled; once they are dispelled, everyone will be better off. The logic of Pirandello's tragicomedy demonstrates that illusions make life bearable; to destroy them is to destroy the basis for any possible happiness.

The role of illusions in Pirandello's tragicomedy

The absurd. In their highly individual ways, both Samuel Beckett and Ionesco have employed the forms of comedy—from tragicomedy to farce—to convey the vision of an exhausted civilization and a chaotic world. The very endurance of life amid the grotesque circumstances that obtain in Beckett's plays is at once a tribute to the human power of carrying on to the end and an ironic reflection on the absurdity of doing so. Beckett's plays close in an uneasy silence that is the more disquieting because of the uncertainty as to just what it conceals: whether it masks sinister forces ready to spring or is the expression of a universal indifference or issues out of nothing at all.

Silence seldom reigns in the theatre of Ionesco, which rings with voices raised in a usually mindless clamour. Some of Ionesco's most telling comic effects have come from his use of dialogue overflowing with clichés and non sequiturs, which make it clear that the characters do not have their minds on what they are saying and, indeed, do not have their minds on anything at all. What they say is often at grotesque variance with what they do. Beneath the moral platitudes lurks violence, which is never far from the surface in Ionesco's plays, and the violence tells what happens to societies in which words and deeds have become fatally disjunct. Ionesco's comic sense is evident as well in his depiction of human beings as automata, their movements decreed by forces they have never questioned or sought to understand. There is something undeniably farcical in Ionesco's spectacles of human regimentation, of men and women at the mercy of things (*e.g.*, the stage full of chairs in *The Chairs* or the growing corpse in *Amédée*); the comic quality here is one that Bergson would have appreciated. But the comic in Ionesco's most serious work, as in so much of the contemporary theatre, has ominous implications that give to it a distinctly grotesque aspect. In Ionesco's *Victims of Duty* and *The Killer* (1959), as in the works of his Swiss counterparts—*Der Besuch der alten Dame* (performed 1956; *The Visit*, 1958) and *The Physicists* (1962), by Friedrich Dürrenmatt, and *The Firebugs* (1958), by Max Frisch—the grotesquerie of the tragicomic vision delineates a world in which the humane virtues are dying, and casual violence is the order of the day.

Ionesco's comic sense

The radical reassessment of the human image that the 20th century has witnessed is reflected in the novel as well as in drama. Previous assumptions about the rational and divine aspects of man have been increasingly called into question by the evidences of man's irrationality, his sheer animality. These are qualities of human nature that writers of previous ages (Swift, for example) have always recognized, but hitherto they have been typically viewed as dark possibilities that could overtake humanity if the rule of reason did not prevail. It is only in the mid-20th century that the savage and the irrational have come to be viewed as part of the normative condition of humanity rather than as tragic aberrations from it. The savage and the irrational amount to grotesque parodies of human possibility, ideally conceived. Thus it is that 20th-century novelists as well as dramatists have recognized the tragicomic nature of the contemporary human image and predicament, and the principal mode of representing both is the grotesque. This may take various forms: the apocalyptic nightmare of tyranny and terror in Kafka's novels *The Trial* (1925) and *The Castle* (1926); the tragic farce in terms of which the Austrian novelist Robert Musil describes the slow collapse of a society into anarchy and chaos, in *The Man Without Qualities* (1930–43); the brilliant irony whereby Thomas Mann represents the hero as a confidence man in *The Confessions of Felix Krull* (1954); the grimly parodic account of Germany's descent into madness in Günter Grass's novel *The Tin Drum* (1959). The English novel contains a rich vein of the comic grotesque that extends at least back to Dickens and Thackeray and persisted in the 20th century in such varied novels as Evelyn Waugh's *Decline and Fall* (1928), Angus Wilson's *Anglo-Saxon Attitudes* (1956), and Kingsley Amis' *Lucky Jim* (1954). What novelists such as these have in common is the often disturbing combination of hilarity and desperation. It has its parallel in a number of American novels—John Barth's *Giles Goat-Boy* (1966), Kurt Vonnegut, Jr.'s *Slaughterhouse Five* (1969)—in which shrill farce is the medium for grim satire. And the grotesque is a prominent feature of modern poetry, as in some of the "Songs and Other Musical Pieces" of W.H. Auden.

THE COMIC IN OTHER ARTS

The visual arts. The increasing use of the affairs of common life as the subject matter of dramatic comedy through the Middle Ages and the Renaissance is also seen in painting of that time. Scenes from medieval mystery cycles, such as the comic episodes involving Noah's stubborn wife, have counterparts in medieval pictures in the glimpses of everyday realities that are caught through the windows or down the road from the sites where the great spiritual mysteries are in progress: the angel Gabriel may appear to the Virgin in the foreground, while a man is chopping wood in the yard outside. Medieval artists had never neglected the labours and the pleasures of the mundane world, but the treatment of them is often literally marginal, as in the depiction of men and women at work or play in the ornamental borders of an illuminated manuscript page. The seasonal round of life, with its cycle of plowing, sowing, mowing, and reaping interspersed with hawking, hunting, feasts, and weddings (the cycle of life, indeed, which comedy itself celebrates), is depicted in series after series of exquisite miniatures, such as those in the *Très Riches Heures du Duc de Berry*. By the mid-16th century, however, in Pieter Bruegel's famous painting "Landscape with the Fall of Icarus," mundane reality has taken over the foreground: the plowman tills the soil, and the shepherd attends his flock, while, unnoticed by both, the legs of Icarus disappear inconspicuously into the sea. Bruegel is not a comic artist, but his art bears witness to what all great comic art celebrates: the basic rhythm of life. "Peasant Wedding" and "Peasant Dance" endow their heavy men and women with an awkward grace and dignity that bear comparison with Shakespeare's treatment of his comic characters. Paintings like Bruegel's "Children's Games" and his "Fight Between Carnival and Lent" are joyous representations of human energy. The series of "The Labours of the Months"—"Hunters in the Snow" for January, "Haymaking" for July, "Harvesters" for August, "Return of the Herd" for November—give

Bruegel's mastery of the grotesque

pictorial treatment to a favourite subject of the medieval miniaturists. Finally, allusion must be made to Bruegel's mastery of the grotesque, notably in "The Triumph of Death" and in the "Dulle Griet," in which demons swarm over a devastated landscape.

It is through the art of caricature that the spirit of comedy enters most directly into painting. The style derives from the portraits with ludicrously exaggerated features made by the Carracci, an Italian family of artists, early in the 17th century (Italian *caricare*, "to overload"). In defiance of the theory of ideal beauty, these portraits emphasized the features that made one man different from another. This method of character portrayal—the singling out of one distinctive feature and emphasizing it over all others—is not unlike the practice of characterizing the personages of the comic stage by means of some predominant humour, which Ben Jonson was developing at about the same time in the London theatre. The use of exaggeration for comic effect was as evident to painters as it was to dramatists. Its usefulness as a means of social and political satire is fully recognized by Hogarth. Hogarth's counterpart in mid-19th-century Paris was Honoré Daumier. His caricatures portray a human comedy as richly detailed and as shrewdly observed as the one portrayed in fiction by his contemporary Balzac. But Daumier's sense of the comic goes beyond caricature; his numerous treatments of scenes from Molière's plays and, most notably, his drawings and canvases of Don Quixote and Sancho Panza attest to the pathos that can lie beneath the comic mask.

Modern art has abstracted elements of comedy to aid it in the representation of a reality in which the mechanical is threatening to win out over the human. Bergson's contention that the essence of comedy consists of something mechanical encrusted on the living may be said to have achieved a grotesque apotheosis in the French Dadaist Marcel Duchamp's painting "Bride" (1912), in which the female figure has been reduced to an elaborate piece of plumbing. The highly individual Swiss Expressionist Paul Klee's pen-and-ink drawing tinted with watercolour and titled "Twittering Machine" (1922) represents an ingenious device for imitating the sound of birds. The delicacy of the drawing contrasts with the sinister implications of the mechanism, which, innocent though it may appear at first glance, is almost certainly a trap.

The grotesque is a constant stylistic feature of the artist's representation of reality in its brutalized or mechanized aspects. The carnival masks worn by the figures in the painting "Intrigue" (1890), by the Belgian James Ensor, make manifest the depravity and the obscenity that lurk beneath the surface of conventional appearances; Ensor's paintings make much the same point about the persistence of the primitive and the savage into modern life as Wedekind's plays were to do a few years later. German artists after World War I invoked the grotesque with particular power, depicting the inhuman forces that bear upon the individual, as in George Grosz's savage cartoon titled "Germany, a Winter's Tale" (1918), in which the puppet-like average citizen sits at table surrounded by militarist, capitalist, fatuous clergyman and all the violent and dissolute forces of a decadent society. The mutilated humanity in Max Beckmann's "Dream" (1921) and "Departure" (1932–33) is a further testament to human viciousness, 20th-century variety.

Fantasy in modern paintings

Rather more explicitly comic is the element of fantasy in modern paintings, in which seemingly unrelated objects are brought together in a fine incongruity, as in the French primitive Henri Rousseau's famous "Dream" (1910), with its nude woman reclining on a red-velvet sofa amid the flora and fauna of a lush and exotic jungle. The disparate figures that float (in defiance of all the laws of gravity) through the paintings of the Russian Surrealist Marc Chagall are individually set forth in a nimbus of memory and in the landscape of dream. But fantasy can take on a grotesquerie of its own, as in some of Chagall's work, such as the painting "I and The Village" (1911).

The purest expression of the comic in modern painting must surely be Henri Matisse's "Joy of Life" (1905–06), a picture that might be taken as a visual expression of the precept that the rhythm of comedy is the basic rhythm of life. But Matisse's painting was not to be the last word on the subject: "Joy of Life" produced, as a counterstatement, Pablo Picasso's "Demoiselles d'Avignon" (1906–07), in which the daughters of joy, in their grim and aggressive physical tension, stand as a cruel parody of the delight in the senses that Matisse's picture celebrates. "Les Demoiselles d'Avignon" and such a later Picasso masterpiece as the "Three Dancers" (1925) suggest that, for the visual as well as the literary artist of the 20th century, the joy of life tends to issue in grotesque shapes.

Music. Given the wide range of imitative sounds of which musical instruments and the human voice are capable, comic effects are readily available to the composer who wants to use them. At the simplest level, these may amount to nothing more than humorous adjuncts to a larger composition, such as the loud noise with which the 18th-century Austrian composer Joseph Haydn surprises his listeners in *Symphony No. 94* or the sound of the ticking clock in *No. 101*. The scherzo, which Ludwig van Beethoven introduced into symphonic music in the early 19th century, may be said to have incorporated in it a musical joke but one of a highly abstract kind; its nervous jocularity provides a contrast and a commentary (both heavy with irony) on the surrounding splendour. A century after Beethoven, the jocularity grew more desperate and the irony more profound in the grim humour that rises out of the grotesque scherzos of Gustav Mahler. A more sustained and a more explicit musical exposition of comic themes and attitudes comes when a composer draws his inspiration directly from a work of comic literature, as Richard Strauss does in his orchestral variations based on *Don Quixote* and on the merry pranks of *Till Eulenspiegel*.

It is, however, opera that provides the fullest form for comedy to express itself in music, and some of the most notable achievements of comic art have been conceived for the operatic stage. High on any list of comic masterpieces must come the four principal operas of Mozart: *The Marriage of Figaro* (1786), *Don Giovanni* (1787), *Così fan tutte* (1790), and *The Magic Flute* (1791), and there are countless others worthy of mention. Operatic comedy has an advantage over comedy in the spoken theatre in its ability to impose a coherent form on the complexities of feeling and action that are often of the essence in comedy. The complex feeling experienced by different characters must be presented in spoken comedy seriatim; operatic comedy can present them simultaneously. When three or four characters talk simultaneously in the spoken theatre, the result is an incoherent babble. But the voices of three or four or even more characters can be blended together in an operatic ensemble, and, while most of the words may be lost, the vocal lines will serve to identify the individual characters and the general nature of the emotions they are expressing. The complexities of action in the spoken theatre are the chief source of the comic effect, which increases as the confusion mounts; such complexities of action operate to the same comic end in opera but here with the added ingredient of music, which provides an overarching design of great formal coherence. In the music, all is manifestly ordered and harmonious, while the events of the plot appear random and chaotic; the contrast between the movement of the plot and the musical progression provides a Mozart or a Rossini with some of his wittiest and most graceful comic effects. Finally, it should be noted that operatic comedy can probe psychological and emotional depths of character that spoken comedy would scarcely attempt. The Countess in Mozart's *Figaro* is a very much more moving figure than she is in Beaumarchais' play; the Elvira of *Don Giovanni* exhibits a fine extravagance that is little more than suggested in Molière's comedy.

The form imposed by music

Television and cinema. When comedy is dependent on the favour of a large part of the public, as reflected in box-office receipts or the purchase of a television sponsor's product, it seldom achieves a high level of art. There is nothing innocent about laughter at the whims and inconsistencies of humankind, and radio and television and film producers have always been wary of offending their audiences with it. On radio and television, the laughter is

usually self-directed (as in the performances of comedians such as Jack Benny or Red Skelton), or it is safely contained within the genial confines of a family situation (*e.g.*, the "Fibber McGee and Molly" radio show or "I Love Lucy" on television). Much the same attitude has obtained with regard to comedy in the theatre in the United States. Satire has seldom succeeded on Broadway, which instead has offered pleasant plays about the humorous behaviour of basically nice people, such as the eccentric family in George S. Kaufmann and Moss Hart's *You Can't Take It with You* (1936) or the lovable head of the household in Howard Lindsay and Russel Crouse's *Life with Father* (1939) or the indefatigable Dolly Levi in Thornton Wilder's *Matchmaker* (1954) and in her later reincarnation in the musical *Hello, Dolly!*

The American public and comedy

The American public has never been quite comfortable in the presence of comedy. The calculated ridicule and the relentless exposure often seem cruel or unfair to a democratic public. If all men are created equal, then it ill becomes anyone to laugh at the follies of his fellows, especially when they are follies that are likely to be shared, given the common background of social opportunity and experience of the general public. There is an insecurity in the mass audience that is not compatible with the high self-assurance of comedy as it judges between the wise and the foolish of the world. The critical spirit of comedy has never been welcome in American literature; in both fiction and drama, humour, not comedy, has raised the laughter. American literature can boast an honorable tradition of humorists, from Mark Twain to James Thurber, but has produced no genuinely comic writer. As American social and moral tenets were subjected to increasing critical scrutiny from the late 1950s onward, however, there were some striking achievements in comedy in various media: Edward Albee's *American Dream* (1961) and *Who's Afraid of Virginia Woolf?* (1962), on the stage; novels such as those of Saul Bellow and Joseph Heller's *Catch-22* (1961); and films such as *Dr. Strangelove* (1964).

This last example is remarkable, because comedy in the medium of film, in America, had been conceived as entertainment and not much more. This is not to say that American film comedies lacked style. The best of them always displayed verve and poise and a thoroughly professional knowledge of how to amuse the public without troubling it. Their shortcoming has always been that the amusement they provide lacks resonance.

If films have seldom explored comedy with great profundity, they have, nonetheless, produced it in great variety. There have been comedies of high sophistication, the work of directors such as Ernst Lubitsch, George Cukor, Frank Capra, Joseph L. Mankiewicz, and Billy Wilder and of actors and actresses such as Greta Garbo (in Lubitsch's *Ninotchka*, 1939), Katharine Hepburn and Cary Grant (in Cukor's *Philadelphia Story*, 1940), Bette Davis (in Mankiewicz' *All About Eve*, 1950), Clark Gable and Claudette Colbert (in Capra's *It Happened One Night*, 1934), Gary Cooper and Jean Arthur (in Capra's *Mr. Deeds Goes to Town*, 1936), and Marilyn Monroe and Jack Lemmon (in Billy Wilder's *Some Like It Hot*, 1959). There have been comedies with music, built around the talents of singers and dancers such as Ruby Keeler and Dick Powell and Ginger Rogers and Fred Astaire; there are the classic farces of Charlie Chaplin and Buster Keaton and, later, of W.C. Fields and the Marx Brothers and Laurel and Hardy; and there is a vast, undistinguished field of comedies dealing with the humours of domestic life. The varieties of comedy in Hollywood films have always been replicas of those on the New York stage; as often as not, they were products of the same talents: in the 1930s, of dramatists such as Philip Barry or S.N. Behrman and composers such as Cole Porter, Richard Rodgers, and Irving Berlin; in the 1960s, of the dramatist Neil Simon and the composer Burt Bacharach.

Comedies produced by European film makers

European film makers, with an older and more intellectual tradition of comedy available to them, produced comedies of more considerable stature. Among French directors, Jean Renoir, in his *The Rules of the Game* (1939), conveyed a moving human drama and a profoundly serious vision of French life on the eve of World War II in a form, deriving from the theatre, that blends the comic and the tragic. His disciple François Truffaut, in *Jules and Jim* (1961), directed a witty and tender but utterly clear-sighted account of how gaiety and love turn deadly. Though not generally regarded as a comic artist, the Swedish film maker Ingmar Bergman produced a masterpiece of film comedy in *Smiles of a Summer Night* (1955), a wise, wry account of the indignities that must sometimes be endured by those who have exaggerated notions of their wisdom or virtue. The films of the Italian director and writer Federico Fellini represent a comic vision worthy of Pirandello. *La strada* (1954), with its Chaplinesque waif (played by Fellini's wife, Giulietta Masina) as central figure, is a disturbing compound of pathos and brutality. Comedy's affirmation of the will to go on living has had no finer portrayal than in Giulietta Masina's performance in the closing scene of *Nights of Cabiria* (1956). *La dolce vita* (1960) is a luridly satiric vision of modern decadence, where ideals are travestied by reality, and everything is illusion and disillusionment; the vision is carried to even more bizarre lengths in Fellini's *Satyricon* (1969), in which the decadence of the modern world is grotesquely mirrored in the ancient one. $8^1/_2$ (1963) and *Juliet of the Spirits* (1965) are Fellini's most brilliantly inventive films, but their technical exuberance is controlled by a profoundly serious comic purpose. The principals in both films are seeking—through the phantasmagoria of their past and present, of their dreams and their delusions, all of which seem hopelessly mixed with their real aspirations—to know themselves. (C.H.Ho.)

Tragedy

Although the word tragedy is often used loosely to describe any sort of disaster or misfortune, it more precisely refers to a work of art, usually a play or novel, that probes with high seriousness questions concerning the role of man in the universe. The Greeks of Attica, the ancient state whose chief city was Athens, first used the word in the 5th century BC to describe a specific kind of play, which was presented at festivals in Greece. Sponsored by the local governments, these plays were attended by the entire community, a small admission fee being provided by the state for those who could not afford it themselves. The atmosphere surrounding the performances was more like that of a religious ceremony than entertainment. There were altars to the gods, with priests in attendance, and the subjects of the tragedies were the misfortunes of the heroes of legend, religious myth, and history. Most of the material was derived from the works of Homer and was common knowledge in the Greek communities. So powerful were the achievements of the three greatest Greek dramatists—Aeschylus (525–456 BC), Sophocles (*c.* 496–406 BC), and Euripides (*c.* 480–406 BC)—that the word they first used for their plays survived and came to describe a literary genre that, in spite of many transformations and lapses, has proved its viability through 25 centuries.

Four great periods of tragedy

Historically, tragedy of a high order has been created in only four periods and locales: Attica, in Greece, in the 5th century BC; England in the reigns of Elizabeth I and James I, from 1558 to 1625; 17th-century France; and Europe and America during the second half of the 19th century and the first half of the 20th. Each period saw the development of a special orientation and emphasis, a characteristic style of theatre. In the modern period, roughly from the middle of the 19th century, the idea of tragedy found embodiment in the collateral form of the novel.

This section focusses primarily on the development of tragedy as a literary genre. Further information on the relationship of tragedy to other types of drama will be found in the section above on *Dramatic literature*. The role of tragedy in the growth of theatre is discussed in THEATRE, THE HISTORY OF WESTERN.

DEVELOPMENT

Origins in Greece. The questions of how and why tragedy came into being and of the bearing of its origins on its development in subsequent ages and cultures have been

investigated by historians, philologists, archaeologists, and anthropologists with results that are suggestive but conjectural. Even the etymology of the world tragedy is far from established. The most generally accepted source is the Greek *tragōidia,* or "goat-song," from *tragos* ("goat") and *aeidein* ("to sing"). The word could have referred either to the prize, a goat, that was awarded to the dramatists whose plays won the earliest competitions or to the dress (goat skins) of the performers, or to the goat that was sacrificed in the primitive rituals from which tragedy developed.

In these communal celebrations, a choric dance may have been the first formal element and perhaps for centuries was the principal element. A speaker was later introduced into the ritual, in all likelihood as an extension of the role of the priest, and dialogue was established between him and the dancers, who became the chorus in the Athenian drama. Aeschylus is usually regarded as the one who, realizing the dramatic possibilities of the dialogue, first added a second speaker and thus invented the form of tragedy. That so sophisticated a form could have been fully developed by a single artist, however, is scarcely credible. Hundreds of early tragedies have been lost, including some by Aeschylus himself. Of some 90 plays attributed to him, only seven have survived.

Four Dionysia, or feasts of the Greek God Dionysus, were held annually in Athens. Since Dionysus once held place as the god of vegetation and the vine, and the goat was believed sacred to him, it has been conjectured that tragedy originated in fertility feasts to commemorate the harvest and the vintage and the associated ideas of the death and renewal of life. The purpose of such rituals is to exercise some influence over these vital forces. Whatever the original religious connections of tragedy may have been, two elements have never entirely been lost: (1) its high seriousness, befitting matters in which survival is at issue and (2) its involvement of the entire community in matters of ultimate and common concern. When either of these elements diminishes, when the form is overmixed with satiric, comic, or sentimental elements, or when the theatre of concern succumbs to the theatre of entertainment, then tragedy falls from its high estate and is on its way to becoming something else.

Two vital elements

As the Greeks developed it, the tragic form, more than any other, raised questions about man's existence. Why must man suffer? Why must man be forever torn between the seeming irreconcilables of good and evil, freedom and necessity, truth and deceit? Are the causes of his suffering outside himself, in blind chance, in the evil designs of others, in the malice of the gods? Are its causes within him, and does he bring suffering upon himself through arrogance, infatuation, or the tendency to overreach himself? Why is justice so elusive?

Aeschylus: the first great tragedian. It is this last question that Aeschylus asks most insistently in his two most famous works, the *Oresteia* (a trilogy comprising *Agamemnon, Choephoroi,* and *Eumenides*) and *Prometheus Bound* (the first part of a trilogy of which the last two parts have been lost): is it right that Orestes, a young man in no way responsible for his situation, should be commanded by a god, in the name of justice, to avenge his father by murdering his mother? Is there no other way out of his dilemma than through the ancient code of blood revenge, which will only compound the dilemma? Again: was it right that in befriending mankind with the gifts of fire and the arts, Prometheus should offend the presiding god Zeus and himself be horribly punished? Aeschylus opened questions whose answers in the Homeric stories had been taken for granted. In Homer, Orestes' patricide is regarded as an act of filial piety, and Prometheus' punishment is merely the inevitable consequence of defying the reigning deity. All of the materials of tragedy, all of its cruelty, loss, and suffering, are present in Homer and the ancient myths but are dealt with as absolutes—self-sufficient and without the questioning spirit that was necessary to raise them to the level of tragedy. It remained for Aeschylus and his fellow tragedians first to treat these "absolutes" critically and creatively in sustained dramatic form. They were true explorers of the human spirit.

In addition to their remarkable probing into the nature of existence, their achievements included a degree of psychological insight for which they are not generally given credit. Though such praise is usually reserved for Shakespeare and the moderns, the Athenian dramatists conveyed a vivid sense of the living reality of their characters' experience: of what it felt like to be caught, like Orestes, in desperately conflicting loyalties or to be subjected, like Prometheus, to prolonged and unjust punishment. The mood of the audience as it witnessed the acting out of these climactic experiences has been described as one of impassioned contemplation. From their myths and epics and from their history in the 6th century, the people of Athens learned that they could extend an empire and lay the foundations of a great culture. From their tragedies of the 5th century, they learned who they were, something of the possibilities and limitations of the spirit, and of what it meant, not merely what it felt like, to be alive in a world both beautiful and terrible.

Aeschylus has been called the most theological of the Greek tragedians. His *Prometheus* has been compared to the Book of Job of the Bible both in its structure (*i.e.,* the immobilized heroic figure maintaining his cause in dialogues with visitors) and in its preoccupation with the problem of suffering at the hands of a seemingly unjust deity. Aeschylus tended to resolve the dramatic problem into some degree of harmony, as scattered evidence suggests he did in the last two parts of the *Promethiad* and as he certainly did in the conclusion of the *Oresteia.* This tendency would conceivably lead him out of the realm of tragedy and into religious assurance. But his harmonies are never complete. In his plays evil is inescapable, loss is irretrievable, suffering is inevitable. What the plays say positively is that man can learn through suffering. The chorus in *Agamemnon,* the first play of the *Oresteia,* says this twice. The capacity to learn through suffering is a distinguishing characteristic of the tragic hero, preeminently of the Greek tragic hero. He has not merely courage, tenacity, and endurance but also the ability to grow, by means of these qualities, into an understanding of himself, of his fellows, and of the conditions of existence. Suffering, says Aeschylus, need not be embittering but can be a source of knowledge. The moral force of his plays and those of his fellow tragedians can hardly be exaggerated. They were shaping agents in the Greek notion of education. It has been said that from Homer the Greeks learned how to be good Greeks; from the tragedies they learned an enlarged humanity. If it cannot be proved that Aeschylus "invented" tragedy, it is clear that he at least set its tone and established a model that is still operative. Even in the 20th century, the *Oresteia* has been acclaimed as the greatest spiritual work of man, and dramatists such as T.S. Eliot, in *The Family Reunion* (1939), and Jean-Paul Sartre, in *The Flies* (1943), found modern relevance in its archetypal characters, situations, and themes.

Aeschylus' view of the problem of suffering

Sophocles: the purest artist. Sophocles' life spanned almost the whole of the 5th century. He is said to have written his last play, *Oedipus at Colonus,* at the age of 90. Only seven of his plays, of some 125 attributed to him, survive. He won the prize in the tragic competitions 20 times and never placed lower than second.

Sophocles has been called the great mediating figure between Aeschylus and Euripides. Of the three, it might be said that Aeschylus tended to resolve tragic tensions into higher truth, to look beyond, or above, tragedy; that Euripides' irony and bitterness led him the other way to fix on the disintegration of the individual; and that Sophocles, who is often called the "purest" artist of the three, was truest to the actual state of human experience. Unlike the others, Sophocles seems never to insinuate himself into his characters or situations, never to manipulate them into preconceived patterns. He sets them free on a course seemingly of their own choosing. He neither preaches nor rails. If life is hard and often destructive, the question Sophocles asks is not how did this come to be or why did such a misfortune have to happen but rather, given the circumstances, how must a man conduct himself, how should he act, what must he do?

His greatest play, *Oedipus the King,* may serve as a model of his total dramatic achievement. Embodied in it,

and suggested with extraordinary dramatic tact, are all the basic questions of tragedy, which are presented in such a way as almost to define the form itself. It is not surprising that Aristotle, a century later, analyzed it for his definition of tragedy in the *Poetics*. It is the nuclear Greek tragedy, setting the norm in a way that cannot be claimed for any other work, not even the *Oresteia*.

Sophocles' emphasis on action

In *Oedipus,* as in Sophocles' other plays, the chorus is much less prominent than in Aeschylus' works. The action is swifter and more highly articulated; the dialogue is sharper, more staccato, and bears more of the meaning of the play. Though much has been made of the influence of fate on the action of the play, later critics emphasize the freedom with which Oedipus acts throughout. Even before the action of the play begins, the oracle's prediction that Oedipus was doomed to kill his father and marry his mother had long since come true, though he did not realize it. Though he was fated, he was also free throughout the course of the play—free to make decision after decision, to carry out his freely purposed action to its completion. In him, Sophocles achieved one of the enduring definitions of the tragic hero—that of a man for whom the liberation of the self is a necessity. The action of the play, the purpose of which is to discover the murderer of Oedipus' father and thereby to free the city from its curse, leads inevitably to Oedipus' suffering—the loss of his wife, his kingdom, his sight. The messenger who reports Oedipus' self-blinding might well have summarized the play with "All ills that there are names for, all are here." And the chorus' final summation deepens the note of despair: "Count no man happy," they say in essence, "until he is dead."

But these were not Sophocles' ultimate verdicts. The action is so presented that the final impression is not of human helplessness at the hands of maligning gods nor of man as the pawn of fate. Steering his own course, with great courage, Oedipus has ferreted out the truth of his identity and administered his own punishment, and, in his suffering, learned a new humanity. The final impression of the *Oedipus,* far from being one of unmixed evil and nihilism, is of massive integrity, powerful will, and magnanimous acceptance of a horribly altered existence.

Some 50 years later, Sophocles wrote a sequel to *Oedipus the King.* In *Oedipus at Colonus,* the old Oedipus, further schooled in suffering, is seen during his last day on earth. He is still the same Oedipus in many ways: hot-tempered, hating his enemies, contentious. Though he admits his "pollution" in the murder of his father and the marriage to his mother, he denies that he had sinned, since he had done both deeds unwittingly. Throughout the play, the theme of which has been described as the "heroization" of Oedipus, he grows steadily in nobility and awesomeness. Finally, sensing the approach of the end, he leaves the scene, to be elevated in death to a demigod, as the messenger describes the miraculous event. In such manner Sophocles leads his tragedy toward an ultimate assertion of values. His position has been described as "heroic humanism," as making a statement of belief in the human capacity to transcend evils, within and without, by means of the human condition itself.

Tragedy must maintain a balance between the higher optimisms of religion or philosophy, or any other beliefs that tend to explain away the enigmas and afflictions of existence, on the one hand, and the pessimism that would reject the whole human experiment as valueless and futile on the other. Thus the opposite of tragedy is not comedy but the literature of cynicism and despair, and the opposite of the tragic artist's stance, which is one of compassion and involvement, is that of the detached and cynical ironist.

Euripides: the dark tragedian. The tragedies of Euripides test the Sophoclean norm in this direction. His plays present in gruelling detail the wreck of human lives under the stresses that the gods often seem willfully to place upon them. Or, if the gods are not willfully involved through jealousy or spite, they sit idly by while man wrecks himself through passion or heedlessness. No Euripidean hero approaches Oedipus in stature. The margin of freedom is narrower, and the question of justice, so central and absolute an ideal for Aeschylus, becomes a subject for irony. In *Hippolytus,* for example, the goddess Artemis never thinks of justice as she takes revenge on the young Hippolytus for neglecting her worship; she acts solely out of personal spite. In *Medea,* Medea's revenge on Jason through the slaughter of their children is so hideously unjust as to mock the very question. In the *Bacchae,* when the frenzied Agave tears her son, Pentheus, to pieces and marches into town with his head on a pike, the god Dionysus, who had engineered the situation, says merely that Pentheus should not have scorned him. The Euripidean gods, in short, cannot be appealed to in the name of justice. Euripides' tendency toward moral neutrality, his cool tacking between sides (*e.g.,* between Pentheus versus Dionysus and the bacchantes) leave the audience virtually unable to make a moral decision. In Aeschylus' *Eumenides* (the last play of the *Oresteia*), the morals of the gods improve. Athena is there, on the stage, helping to solve the problem of justice. In Sophocles, while the gods are distant, their moral governance is not questioned. *Oedipus* ends as if with a mighty "So be it." In Euripides, the gods are destructive, wreaking their capricious wills on defenseless man. Aristotle called Euripides the most tragic of the three dramatists; surely his depiction of the arena of human life is the grimmest.

Euripides' view of justice

Many qualities, however, keep his tragedies from becoming literature of protest, of cynicism, or of despair. He reveals profound psychological insight, as in the delineation of such antipodal characters as Jason and Medea, or of the forces, often subconscious, at work in the group frenzy of the *Bacchae.* His Bacchic odes reveal remarkable lyric power. And he has a deep sense of human values, however external and self-conscious. Medea, even in the fury of her hatred for Jason and her lust for revenge, must steel herself to the murder of her children, realizing the evil of what she is about to do. In this realization, Euripides suggests a saving hope: here is a great nature gone wrong—but still a great nature.

Later Greek drama. After Euripides, Greek drama reveals little that is significant to the history of tragedy. Performances were given during the remainder of the pre-Christian era in theatres throughout the Mediterranean world, but, with the decline of Athens as a city-state, the tradition of tragedy eroded. As external affairs deteriorated, the high idealism, the exalted sense of human capacities depicted in tragedy at its height yielded more and more to the complaints of the skeptics. The Euripidean assault on the gods ended in the debasement of the original lofty conceptions. A 20th-century British classical scholar, Gilbert Murray, used the phrase "the failure of nerve" to describe the late Greek world. It may, indeed, provide a clue to what happened. On the other hand, according to the 19th-century German philosopher Friedrich Nietzsche, in *The Birth of Tragedy* (1872), a quite different influence may have spelled the end of Greek tragedy: the so-called Socratic optimism, the notion underlying the dialogues of Plato that man could "know himself" through the exercise of his reason in patient, careful dialectic—a notion that diverted questions of man's existence away from drama and into philosophy. In any case, the balance for tragedy was upset, and the theatre of Aeschylus, Sophocles, and Euripides gave way to what seems to have been a theatre of diatribe, spectacle, and entertainment.

Reasons for the decline of Greek tragedy

The long hiatus. The Roman world failed to revive tragedy. Seneca (4 BC–AD 65) wrote at least eight tragedies, mostly adaptations of Greek materials, such as the stories of Oedipus, Hippolytus, and Agamemnon, but with little of the Greek tragic feeling for character and theme. The emphasis is on sensation and rhetoric, tending toward melodrama and bombast. The plays are of interest in this context mainly as the not entirely healthy inspiration for the precursors of Elizabethan tragedy in England.

The long hiatus in the history of tragedy between the Greeks and the Elizabethans has been variously explained. In the Golden Age of Roman literature, roughly from the birth of Virgil in 70 BC to the death of Ovid in AD 17, the Roman poets followed the example of Greek literature; although they produced great lyric and epic verse, their tragic drama lacked the probing freshness and directness fundamental to tragedy.

Tragedy and the Christian mass

With the collapse of the Roman world and the invasions of the barbarians came the beginnings of the long, slow development of the Christian Church. Churchmen and philosophers gradually forged a system, based on the Christian revelation, of the nature and destiny of man. The mass, with its daily reenactment of the sacrifice of Jesus Christ, its music, and its dramatic structure, may have provided something comparable to tragic drama in the lives of the people.

With the coming of the Renaissance, the visual arts more and more came to represent the afflictive aspects of life, and the word tragedy again came into currency. Chaucer (1340–1400) used the word in *Troilus and Criseyde,* and in *The Canterbury Tales* it is applied to a series of stories in the medieval style of *de casibus virorum illustrium,* meaning "the downfalls" (more or less inevitable) "of princes." Chaucer used the word to signify little more than the turn of the wheel of fortune, against whose force no meaningful effort of man is possible. It remained for the Elizabethans to develop a theatre and a dramatic literature that reinstated the term on a level comparable to that of the Greeks.

Elizabethan. The long beginning of the Elizabethan popular theatre, like that of the Greek theatre, lay in religious ceremonials, probably in the drama in the liturgy of the two greatest events in the Christian year, Christmas and Easter. In the Early Church, exchanges between two groups of choristers, or between the choir and a solo voice, led to the idea of dialogue, just as it had in the development of Greek tragedy. The parts became increasingly elaborate, and costumes were introduced to individualize the characters. Dramatic gestures and actions were a natural development. More and more of the biblical stories were dramatized, much as the material of Homer was used by the Greek tragedians, although piously in this instance, with none of the tragic skepticism of the Greeks. In the course of generations, the popularity of the performances grew to such an extent that, to accommodate the crowds, they were moved, from inside the church to the porch, or square, in front of the church. The next step was the secularization of the management of the productions, as the towns and cities took them over. Day-long festivals were instituted, involving, as in the Greek theatre, the whole community. Cycles of plays were performed at York, Chester, and other English religious centres, depicting in sequences of short dramatic episodes the whole human story, from the Fall of Lucifer and the Creation to the Day of Doom. Each play was assigned to an appropriate trade guild (the story of Noah and the Ark, for example, went to the shipwrights), which took over complete responsibility for the production. Hundreds of actors and long preparation went into the festivals. These "miracle" and "mystery" plays, however crude they may now seem, dealt with the loftiest of subjects in simple but often powerful eloquence. Although the audience must have been a motley throng, it may well have been as involved and concerned as those of the Greek theatre.

Cycles of miracle and mystery plays

Once the drama became a part of the secular life of the communities, popular tastes affected its religious orientation. Comic scenes, like those involving Noah's nagging wife, a purely secular creation who does not appear in the Bible, became broader. The "tragic" scenes—anything involving the Devil or Doomsday—became more and more melodramatic. With the Renaissance came the rediscovery of the Greek and Roman cultures and the consequent development of a world view that led away from moral and spiritual absolutes and toward an increasingly skeptical individualism. The high poetic spirits of the mid-16th century began to turn the old medieval forms of the miracles and mysteries to new uses and to look to the ancient plays, particularly the lurid tragedies of Seneca, for their models. A bloody play, *Gorboduc,* by Thomas Sackville and Thomas Norton, first acted in 1561, is now known as the first formal tragedy in English, though it is far from fulfilling the high offices of the form in tone, characterization, and theme. Thomas Kyd's *Spanish Tragedie* (*c.* 1589) continued the Senecan tradition of the "tragedy of blood" with somewhat more sophistication than *Gorboduc* but even more bloodletting. Elizabethan tragedy never freed itself completely from certain melodramatic aspects of the influence of Seneca.

Marlowe and the first Christian tragedy. The first tragedian worthy of the tradition of the Greeks was Christopher Marlowe (1564–93). Of Marlowe's tragedies, *Tamburlaine* (1587), *Doctor Faustus* (*c.* 1588), *The Jew of Malta* (1589), and *Edward II* (*c.* 1593), the first two are the most famous and most significant. In *Tamburlaine,* the material was highly melodramatic—Tamburlaine's popular image was that of the most ruthless and bloody of conquerors. In a verse prologue, when Marlowe invites the audience to "View but his [Tamburlaine's] picture in this tragic glass," he had in mind little more, perhaps, than the trappings and tone of tragedy: "the stately tent of war," which is to be his scene, and "the high astounding terms," which will be his rhetoric. But he brought such imaginative vigour and sensitivity to bear that melodrama is transcended, in terms reminiscent of high tragedy. Tamburlaine, a Scythian shepherd of the 14th century, becomes the spokesman, curiously enough, for the new world of the Renaissance—iconoclastic, independent, stridently ambitious. Just as the Greek tragedians challenged tradition, Tamburlaine shouts defiance at all the norms, religious and moral, that Marlowe's generation inherited. But Tamburlaine, although he is an iconoclast, is also a poet. No one before him on the English stage had talked with such magnificent lyric power as he does, whether it be on the glories of conquest or on the beauties of Zenocrate, his beloved. When, still unconquered by any enemy, he sickens and dies, he leaves the feeling that something great, however ruthless, has gone. Here once again is the ambiguity that was so much a part of the Greek tragic imagination—the combination of awe, pity, and fear that Aristotle defined.

Conflict between tradition and individualism

In *Doctor Faustus* the sense of conflict between the tradition and the new Renaissance individualism is much greater. The claims of revealed Christianity are presented in the orthodox spirit of the morality and mystery plays, but Faustus' yearnings for power over space and time are also presented with a sympathy that cannot be denied. Here is modern man, tragic modern man, torn between the faith of tradition and faith in himself. Faustus takes the risk in the end and is bundled off to hell in true mystery-play fashion. But the final scene does not convey that justice has been done, even though Faustus admits that his fate is just. Rather, the scene suggests that the transcendent human individual has been caught in the consequences of a dilemma that he might have avoided but that no imaginative man *could* have avoided. The sense of the interplay of fate and freedom is not unlike that of *Oedipus.* The sense of tragic ambiguity is more poignant in Faustus than in *Oedipus* or *Tamburlaine* because Faustus is far more introspective than either of the other heroes. The conflict is inner; the battle is for Faustus' soul, a kind of conflict that neither the Greeks nor Tamburlaine had to contend with. For this reason, and not because it advocates Christian doctrine, the play has been called the first Christian tragedy.

Shakespearean tragedy. Shakespeare was a long time coming to his tragic phase, the six or seven years that produced his five greatest tragedies, *Hamlet* (*c.* 1601), *Othello* (*c.* 1602), *King Lear* (*c.* 1605), *Macbeth* (*c.* 1605), and *Antony and Cleopatra* (*c.* 1606). These were not the only plays written during those years. *Troilus and Cressida* may have come about the same time as *Hamlet; All's Well That Ends Well,* shortly after *Othello;* and *Measure for Measure,* shortly before *King Lear.* But the concentration of tragedies is sufficient to distinguish this period from that of the comedies and history plays before and of the so-called romances afterward. Although the tragic period cannot entirely be accounted for in terms of biography, social history, or current stage fashions, all of which have been adduced as causes, certain questions should be answered, at least tentatively: What is Shakespeare's major tragic theme and method? How do they relate to classical, medieval, and Renaissance traditions? In attempting to answer these questions, this proviso must be kept in mind: the degree to which he was consciously working in these traditions, consciously shaping his plays on early models, adapting Greek and Roman themes to his own purpose,

or following the precepts of Aristotle must always remain conjectural. On the one hand, there is the comment by Ben Jonson that Shakespeare had "small Latin and less Greek," and Milton in "L'Allegro" speaks of him as "fancy's child" warbling "his native wood-notes wild," as if he were unique, a sport of nature. On the other hand, Shakespeare knew Jonson (who knew a great deal of Latin and Greek) and is said to have acted in Jonson's *Sejanus* in 1603, a very classical play, published in 1605 with a learned essay on Aristotle as preface. It can be assumed that Shakespeare knew the tradition. Certainly the Elizabethan theatre could not have existed without the Greek and Roman prototype. For all of its mixed nature—with comic and melodramatic elements jostling the tragic—the Elizabethan theatre retained some of the high concern, the sense of involvement, and even the ceremonial atmosphere of the Greek theatre. When tragedies were performed, the stage was draped in black. Modern studies have shown that the Elizabethan theatre retained many ties with both the Middle Ages and the tradition of the Greeks.

Tragic elements in Shakespeare's comedies and histories

Shakespeare's earliest and most lighthearted plays reveal a sense of the individual, his innerness, his reality, his difference from every other individual, and, at times, his *plight*. Certain stock characters, to be sure, appear in the early comedies. Even Falstaff, that triumphant individual, has a prototype in the braggadocio of Roman comedy, and even Falstaff has his tragic side. As Shakespeare's art developed, his concern for the plight or predicament or dilemma seems to have grown. His earliest history plays, for instance (*Henry VI*, Parts I, II, III), are little more than chronicles of the great pageant figures—kingship in all its colour and potency. *Richard III*, which follows them, focusses with an intensity traditionally reserved for the tragic hero on one man and on the sinister forces, within and without, that bring him to destruction. From kingship, that is, Shakespeare turned to the king, the symbolic individual, the focal man, to whom whole societies look for their values and meanings. Thus Richard III is almost wholly sinister, though there exists a fascination about him, an all but tragic ambiguity.

Although Shakespeare's developing sense of the tragic cannot be summed up adequately in any formula, one might hazard the following: he progressed from the *individual* of the early comedies; to the *burdened* individual, such as, in *Henry IV*, Prince Hal, the future Henry V, who manipulates, rather than suffers, the tragic ambiguities of the world; and, finally, in the great tragedies, to (in one critic's phrase) the *overburdened* individual, Lear being generally regarded as the greatest example. In these last plays, man is at the limits of his sovereignty as a human being, where everything that he has lived by, stood for, or loved is put to the test. Like Prometheus on the crag, or Oedipus as he learns who he is, or Medea deserted by Jason, the Shakespearean tragic heroes are at the extremities of their natures. Hamlet and Macbeth are thrust to the very edge of sanity; Lear and, momentarily, Othello are thrust beyond it. In every case, as in the Greek plays, the destructive forces seem to combine inner inadequacies or evils, such as Lear's temper or Macbeth's ambition, with external pressures, such as Lear's "tiger daughters," the witches in *Macbeth*, or Lady Macbeth's importunity. Once the destructive course is set going, these forces operate with the relentlessness the Greeks called Moira, or Fate.

Total vision of Shakespeare's tragedies

At the height of his powers, Shakespeare's tragic vision comprehended the totality of possibilities for good and evil as nearly as the human imagination ever has. His heroes are the vehicles of psychological, societal, and cosmic forces that tend to ennoble and glorify humanity or infect it and destroy it. The logic of tragedy that possessed him demanded an insistence upon the latter. Initially, his heroes make free choices and are free time after time to turn back, but they move toward their doom as relentlessly as did Oedipus. The total tragic statement, however, is not limited to the fate of the hero. He is but the centre of an action that takes place in a context involving many other characters, each contributing a point of view, a set of values or antivalues to the complex dialectic of the play. In Macbeth's demon-ridden Scotland, where weird things happen to men and horses turn cannibal, there is the virtuous Malcolm, and society survives. Hamlet had the trustworthy friend Horatio, and, for all the bloodletting, what was "rotten" was purged. In the tragedies, most notably *Lear*, the Aeschylean notion of "knowledge through suffering" is powerfully dramatized; it is most obvious in the hero, but it is also shared by the society of which he is the focal figure. The flaw in the hero may be a *moral* failing or, sometimes, an excess of virtue; the flaw in society may be the rottenness of the Danish court in *Hamlet* or the corruption of the Roman world in *Antony and Cleopatra;* the flaw or fault or dislocation may be in the very universe itself, as dramatized by Lear's raving at the heavens or the ghosts that walk the plays or the witches that prophesy. All these faults, Shakespeare seems to be saying, are inevitabilities of the human condition. But they do not spell rejection, nihilism, or despair. The hero may die, but in the words of the novelist E.M. Forster to describe the redeeming power of tragedy, "he has given us life."

Such is the precarious balance a tragedian must maintain: the cold, clear vision that sees the evil but is not maddened by it, a sense of the good that is equally clear but refuses the blandishments of optimism or sentimentalism. Few have ever sustained the balance for long. Aeschylus tended to slide off to the right, Euripides to the left, and even Sophocles had his hero transfigured at Colonus. Marlowe's early death should perhaps spare him the criticism his first plays warrant. Shakespeare's last two tragedies, *Macbeth* and *Antony and Cleopatra*, are close to the edge of a valueless void. The atmosphere of *Macbeth* is murky with evil; the action moves with almost melodramatic speed from horror to horror. The forces for good rally at last, but Macbeth himself steadily deteriorates into the most nihilistic of all Shakespeare's tragic heroes, saved in nothing except the sense of a great nature, like Medea, gone wrong. *Antony*, in its ambiguities and irony, has been considered close to the Euripidean line of bitterness and detachment. Shakespeare himself soon modulated into another mood in his last plays, *Cymbeline* (*c.* 1609), *The Winter's Tale* (*c.* 1610), and *The Tempest* (*c.* 1611). Each is based on a situation that could have been developed into major tragedy had Shakespeare followed out its logic as he had done with earlier plays. For whatever reason, however, he chose not to. The great tragic questions are not pressed. *The Tempest*, especially, for all Prospero's charm and magnanimity, gives a sense of brooding melancholy over the ineradicable evil in mankind, a patient but sad acquiescence. All of these plays end in varying degrees of harmony and reconciliation. Shakespeare willed it so.

Decline in 17th-century England. From Shakespeare's tragedies to the closing of the theatres in England by the Puritans in 1642, the quality of tragedy is steadily worse, if the best of the Greek and Shakespearean tragedies are taken as a standard. Among the leading dramatists of the period—John Webster, Thomas Middleton, Francis Beaumont, John Fletcher, Cyril Tourneur, and John Ford—there were some excellent craftsmen and brilliant poets. Though each of them has a rightful place in the history of English drama, tragedy suffered a transmutation in their hands.

The Jacobean transmutation

The Jacobean dramatists—those who flourished in England during the reign of James I—failed to transcend the negative tendencies they inherited from Elizabethan tragedy: a sense of defeat, a mood of spiritual despair implicit in Marlowe's tragic thought; in the nihilistic broodings of some of Shakespeare's characters in their worst moods—Hamlet, Gloucester in *Lear*, Macbeth; in the metaphoric implication of the theme of insanity, of man pressed beyond the limit of endurance, that runs through many of these tragedies; most importantly, perhaps, in the moral confusion ("fair is foul and foul is fair") that threatens to unbalance even the staunchest of Shakespeare's tragic heroes. This sinister tendency came to a climax about 1605 and was in part a consequence of the anxiety surrounding the death of Queen Elizabeth I and the accession of James I. Despite their negative tendencies, the Elizabethans, in general, had affirmed life and celebrated it; Shakespeare's moral balance, throughout even his darkest plays, remained firm. The Jacobeans, on the

other hand, were possessed by death. They became superb analysts of moral confusion and of the darkened vision of humanity at cross purposes, preying upon itself; of lust, hate, and intrigue engulfing what is left of beauty, love, and integrity. There is little that is redemptive or that suggests, as had Aeschylus, that evil might be resolved by the enlightenment gained from suffering. As in the tragedies of Euripides, the protagonist's margin of freedom grows ever smaller. "You are the deed's creature," cries a murderer to his unwitting lady accomplice in Middleton's *Changeling* (1622), and a prisoner of her deed she remains. Many of the plays maintained a pose of ironic, detached reportage, without the sense of sympathetic involvement that the greatest tragedians have conveyed from the beginning.

Some of the qualities of the highest tragedians have been claimed for John Webster. One critic points to his search for a moral order as a link to Shakespeare and sees in his moral vision a basis for renewal. Webster's *Duchess of Malfi* (*c.* 1613) has been interpreted as a final triumph of life over death. Overwhelmed by final unleashed terror, the Duchess affirms the essential dignity of man. Despite such vestiges of greatness, however, the trend of tragedy was downward. High moral sensitivity and steady conviction are required to resist the temptation to resolve the intolerable tensions of tragedy into either the comfort of optimism or the relaxed apathy of despair. Periods of the creation of high tragedy are therefore few and shortlived. The demands on artist and audience alike are very great. Forms wear out, and public taste seems destined to go through inevitable cycles of health and disease. What is to one generation powerful and persuasive rhetoric becomes bombast and bathos to the next. The inevitable materials of tragedy—violence, madness, hate, and lust—soon lose their symbolic role and become perverted to the uses of melodrama and sensationalism, mixed, for relief, with the broadest comedy or farce.

These corruptions had gone too far when John Milton, 29 years after the closing of the theatres, attempted to bring back the true spirit and tone of tragedy, which he called "the gravest, moralest, and most profitable of all other Poems." His *Samson Agonistes* (1671), however, is magnificent "closet tragedy"—drama more suitable for reading than for popular performance. Modelled on the *Prometheus*, it recalls Aeschylus' tragedy both in its form, in which the immobilized hero receives a sequence of visitors, and in its theme, in which there is a resurgence of the hero's spirit under stress. With Restoration comedy in full swing, however, and with the "heroic play" (an overly moralized version of tragedy) about to reach its crowning achievement in John Dryden's *All for Love* only seven years later (published 1678), *Samson Agonistes* was an anachronism.

Neoclassical. *Corneille and Racine.* Another attempt to bring back the ancient form had been going on for some time across the English Channel, in France. The French Classical tragedy, whose monuments are Pierre Corneille's *Cid* (1637) and Jean Racine's *Bérénice* (1670) and *Phèdre* (1677), made no attempt to be popular in the way of the Elizabethan theatre. The plays were written by and for intellectual aristocrats, who came together in an elite theatre, patronized by royalty and nobility. Gone were the bustle and pageantry of the Elizabethan tragedies, with their admixtures of whatever modes and moods the dramatists thought would work. The French playwrights submitted themselves to the severe discipline they derived from the Greek models and especially the "rules," as they interpreted them, laid down by Aristotle. The unities of place, time, and action were strictly observed. One theme, the conflict between Passion and Reason, was uppermost. The path of Reason was the path of Duty and Obligation (noblesse oblige), and that path had been clearly plotted by moralists and philosophers, both ancient and modern. In this sense there was nothing exploratory in the French tragedy; existing moral and spiritual norms were insisted upon. The norms are never criticized or tested as Aeschylus challenged the Olympians or as Marlowe presented, with startling sympathy, the Renaissance overreacher. Corneille's *Cid* shows Duty triumphant over Passion, and, as a reward, hero and heroine are happily united. By the time of *Phèdre*, Corneille's proud affirmation of the power of the will and the reason over passion had given way to what Racine called "stately sorrow," with which he asks the audience to contemplate Phèdre's heroic, but losing, moral struggle. Her passion for her stepson, Hippolyte, bears her down relentlessly. Her fine principles and heroic will are of no avail. Both she and Hippolyte are destroyed. The action is limited to one terrible day; there is no change of scene; there is neither comic digression nor relief—the focus on the process by which a great nature goes down is sharp and intense. Such is the power of Racine's poetry (it is untranslatable), his conception of character, and his penetrating analysis of it, that it suggests the presence of Sophoclean "heroic humanism." In this sense it could be said that Racine tested the norms, that he uncovered a cruel injustice in the nature of a code that could destroy such a person as Phèdre. Once again, here is a world of tragic ambiguity, in which no precept or prescription can answer complicated human questions.

The return to Greek models

The English "heroic play." This ambiguity was all but eliminated in the "heroic play" that vied with the comedy of the Restoration stage in England in the latter part of the 17th century. After the vicissitudes of the Civil War, the age was hungry for heroism. An English philosopher of the time, Thomas Hobbes, defined the purpose of the type: "The work of an heroic poem is to raise admiration, principally for three virtues, valor, beauty, and love." Moral concern, beginning with Aeschylus, has always been central in tragedy, but in the works of the great tragedians this concern was exploratory and inductive. The moral concern of the heroic play is the reverse. It is deductive and dogmatic. The first rule, writes Dryden (following the contemporary French critic, René Le Bossu) in his preface to his *Troilus and Cressida* (1679), is "to make the moral of the work: that is, to lay down to yourself what that precept of morality shall be, which you would insinuate into the people . . . ." In *All for Love* the moral is all too clear: Antony must choose between the path of honour and his illicit passion for Cleopatra. He chooses Cleopatra, and they are both destroyed. Only Dryden's poetry, with its air of emotional argumentation, manages to convey human complexities in spite of his moral bias and saves the play from artificiality—makes it, in fact, the finest near-tragic production of its age.

Inductive and deductive morality

The eclipse of tragedy. Although the annals of the drama from Dryden onward are filled with plays called tragedies by their authors, the form as it has been defined here went into an eclipse during the late 17th, the 18th, and the early 19th centuries. Reasons that have been suggested for the decline include the politics of the Restoration in England; the rise of science and, with it, the optimism of the Enlightenment throughout Europe; the developing middle class economy; the trend toward reassuring deism in theology; and, in literature, the rise of the novel and the vogue of satire. The genius of the age was discursive and rationalistic. In France and later in England, belief in Evil was reduced to the perception of evils, which were looked upon as institutional and therefore remediable. The nature of man was no longer the problem; rather, it was the better organization and management of men. The old haunting fear and mystery, the sense of ambiguity at the centre of man's nature and of dark forces working against him in the universe, were replaced by a new and confident dogma. Tragedy never lost its high prestige in the minds of the leading spirits. Theorizing upon it were men of letters as diverse as Dr. Samuel Johnson, David Hume, Samuel Taylor Coleridge, and Percy Bysshe Shelley and German philosophers from Gotthold Lessing in the 18th century to Friedrich Nietzsche in the 19th. Revivals of Shakespeare's tragedies were often bowdlerized or altered, as in the happy ending for *Lear* in a production of 1681. Those who felt themselves called upon to write tragedies produced little but weak imitations. Shelley tried it once, in *The Cenci* (1819), but, as his wife wrote, "the bent of his mind went the other way"—which way may be seen in his *Prometheus Unbound* (1820), in which Zeus is overthrown and man enters upon a golden age, ruled by the power of love. Goethe had the sense to stay away from tragedy: "The mere attempt to write tragedy," he

said, "might be my undoing." He concluded his two-part *Faust* (1808, 1832) in the spirit of the 19th-century optimistic humanitarianism. It was not until the latter part of the 19th century, with the plays of a Norwegian, Henrik Ibsen, a Russian, Anton Chekhov, a Swede, August Strindberg, and, later, an American, Eugene O'Neill, that something of the original vision returned to inspire the tragic theatre.

A new vehicle: the novel. The theme and spirit of tragedy, meanwhile, found a new vehicle in the novel. This development is important, however far afield it may seem from the work of the formal dramatists. The English novelist Emily Brontë's *Wuthering Heights* (1847), in its grim Yorkshire setting, reflects the original concerns of tragedy: *i.e.*, the terrifying divisions in nature and human nature, love that creates and destroys, character at once fierce and pitiable, destructive actions that are willed yet seemingly destined, as if by a malicious fate, yet the whole controlled by an imagination that learns as it goes. Another English novelist, Thomas Hardy, in the preface to his *Woodlanders* (1887), speaks of the rural setting of this and other of his novels as being comparable to the stark and simple setting of the Greek theatre, giving his novels something of that drama's intensity and sharpness of focus. His grimly pessimistic view of man's nature and destiny and of the futility of human striving, as reflected in his novels *The Return of the Native* (1878), *Tess of the D'Urbervilles* (1891), and *Jude the Obscure* (1895), is barely redeemed for tragedy by his sense of the beauty of nature and of the beauty and dignity of human character and effort, however unavailing.

Thomas Hardy's pessimism

The work of the Polish-born English novelist Joseph Conrad (1857–1924) provides another kind of setting for novels used as vehicles of the tragic sense. *Lord Jim* (1900), originally conceived as a short story, grew to a full-length novel as Conrad found himself exploring in ever greater depth the perplexing, ambiguous problem of lost honour and guilt, expiation and heroism. Darkness and doubt brood over the tale, as they do over his long story "Heart of Darkness" (1899), in which Conrad's narrator, Marlow, again leads his listeners into the shadowy recesses of the human heart, with its forever unresolved and unpredictable capacities for good and evil.

Dostoyevsky's tragic view. In Russia, the novels of Fyodor Dostoyevsky, particularly *Crime and Punishment* (1866) and *The Brothers Karamazov* (1880), revealed a world of paradox, alienation, and loss of identity, prophetic of the major tragic themes of the 20th century. More than any earlier novelist, Dostoyevsky appropriated to his fictions the realm of the subconscious and explored in depth its shocking antinomies and discontinuities. Sigmund Freud, the founder of psychoanalysis, frequently acknowledged his indebtedness to Dostoyevsky's psychological insights. Dostoyevsky's protagonists are reminiscent of Marlowe's Doctor Faustus, caught between the old world of orthodox belief and the new world of intense individualism, each with its insistent claims and justifications. The battleground is once more the soul of man, and the stakes are survival. Each of his major heroes—Raskolnikov in *Crime and Punishment* and the three Karamazovs—wins a victory, but it is in each case morally qualified, partial, or transient. The harmonious resolutions of the novels seem forced and are neither decisive of the action nor definitive of Dostoyevsky's total tragic view.

Paradox, alienation, loss of identity in Dostoyevsky

The American tragic novel. In America, Nathaniel Hawthorne's novel *The Scarlet Letter* (1850) and Herman Melville's *Moby Dick* (1851) are surprisingly complete embodiments of the tragic form, written as they were at a time of booming American optimism, materialistic expansion, and sentimentalism in fiction—and no tragic theatre whatever. In *The Scarlet Letter*, a story of adultery set in colonial New England, the heroine's sense of sin is incomplete; her spirited individualism insists (as she tells her lover) that "what we did had a consecration of its own." The resulting conflict in her heart and mind is never resolved, and, although it does not destroy her, she lives out her life in gray and tragic isolation. Melville said that he was encouraged by Hawthorne's exploration of "a certain tragic phase of humanity," by his deep broodings and by the "blackness of darkness" in him, to proceed with similar explorations of his own in *Moby Dick*, which he dedicated to Hawthorne. Its protagonist, Captain Ahab, represents a return to what Melville called (defending Ahab's status as tragic hero) a "mighty pageant creature, formed for noble tragedies," whose "ponderous heart," "globular brain," and "nervous lofty language" prove that even an old Nantucket sea captain can take his place with kings and princes of the ancient drama. Shakespearean echoes abound in the novel; some of its chapters are written in dramatic form. Its theme and central figure, reminiscent of Job and Lear in their search for justice and of Oedipus in his search for the truth, all show what Melville might have been—a great tragic dramatist had there been a tragic theatre in America.

Some American novelists of the 20th century carried on, however partially, the tragic tradition. Theodore Dreiser's *American Tragedy* (1925) is typical of the naturalistic novel, which is also represented by the work of Stephen Crane, James T. Farrell, John Steinbeck. Though showing great sensitivity to environmental or sociological evils, such works fail to embody the high conception of character (as Melville describes it above) and are concerned mainly with externals, or reportage. The protagonists are generally "good" (or weak) and beaten down by society. The novels of Henry James, which span the period from 1876 to 1904, are concerned with what has been called the tragedy of manners. The society James projects is sophisticated, subtle, and sinister. The innocent and the good are destroyed, like Milly Theale in *The Wings of the Dove* (1902), who in the end "turns her face to the wall" and dies but in her death brings new vision and new values to those whose betrayals had driven her to her death.

The trend in American fiction, as in the drama, continued in the 20th century, toward the pathos of the victim—the somehow inadequate, the sometimes insignificant figure destroyed by such vastly unequal forces that the struggle is scarcely significant. F. Scott Fitzgerald's Gatsby in his novel *The Great Gatsby* (1925) is betrayed by his own meretricious dream, nurtured by a meretricious society. The hero of Ernest Hemingway's novel *A Farewell to Arms* (1929), disillusioned by war, makes a separate peace, deserts, and joins his beloved in neutral Switzerland. When she dies in childbirth, he sees it as still another example of how "they"—society, the politicians who run the war, or the mysterious forces destroying Catherine—get you in the end. The tone is lyric and pathetic rather than tragic (though Hemingway called the novel his *Romeo and Juliet*). Grief turns the hero away from, rather than toward, a deeper examination of life.

Only the novels of William Faulkner, in their range and depth and in their powerful assault on the basic tragic themes, recall unmistakably the values of the tragic tradition. His "saga of the South," as recounted in a series of novels (notably *Sartoris*, 1929; *The Sound and the Fury*, 1929; *As I Lay Dying*, 1930; *Sanctuary*, 1931; *Light in August*, 1932; *Absalom, Absalom!* 1936; *Intruder in the Dust*, 1948; *Requiem for a Nun*, 1951), incorporates some 300 years of Southern history from Indian days to the present. At first regarded as a mere exploiter of decadence, he can now be seen as gradually working beyond reportage and toward meaning. His sociology became more and more the "sin" of the South—the rape of the land, slavery, the catastrophe of the Civil War and its legacy of a cynical and devitalized materialism. Increasingly he saw the conflict as internal. The subject of art, Faulkner said in his 1949 Nobel Prize speech, is "the human heart in conflict with itself." His insistence is on guilt as the evidence of man's fate, and on the possibility of expiation as the assertion of man's freedom. Compassion, endurance, and the capacity to learn are seen to be increasingly effective in his characters. In the veiled analogies to Christ as outcast and redeemer in *Light in August* and in the more explicit Christology of *A Fable* (1954), in the pastoral serenity following the anguish and horror in *Light in August*, and in the high comedy of the last scene of *Intruder in the Dust*, Faulkner puts into tragic fiction the belief he stated in his Nobel speech: "I decline to accept the end of man."

Guilt and expiation in Faulkner

TRAGEDY AND MODERN DRAMA

Tragic themes in Ibsen, Strindberg, and Chekhov. The movement toward naturalism in fiction in the latter decades of the 19th century did much to purge both the novel and the drama of the sentimentality and evasiveness that had so long emasculated them. In Norway Henrik Ibsen incorporated in his plays the smug and narrow ambitiousness of his society. The hypocrisy of overbearing men and women replace, in their fashion, the higher powers of the old tragedy. His major tragic theme is the futility, leading to catastrophe, of the idealist's effort to create a new and better social order. The "Problem play"—one devoted to a particular social issue—is saved in his hand from the flatness of a sociological treatise by a sense of doom, a pattern of retribution, reminiscent of the ancient Greeks. In *Pillars of Society* (1877), *The Wild Duck* (published 1884), *Rosmersholm* (published 1886), and *The Master Builder* (published 1892), for example, one sacrifice is expiated by another.

In Sweden, August Strindberg, influenced by Ibsen, was a powerful force in the movement. *The Father* (1887) and *Miss Julie* (published 1888) recall Ibsen's attacks on religious, moral, and political orthodoxies. Strindberg's main concern, however, is with the destructive effects of sexual maladjustment and psychic imbalance. Not since Euripides' *Medea* or Racine's *Phèdre* had the tragic aspects of sex come under such powerful analysis. In this respect, his plays look forward to O'Neill's.

Anton Chekhov, the most prominent Russian dramatist of the period, wrote plays about the humdrum life of inconspicuous, sensitive people (*Uncle Vanya,* 1899; *The Three Sisters,* 1901; and *The Cherry Orchard,* 1904, are typical), whose lives fall prey to the hollowness and tedium of a disintegrating social order. They are a brood of lesser Hamlets without his compensating vision of a potential greatness. As in the plays of the Scandinavian dramatists, Chekhov's vision of this social evil is penetrating and acute, but the powerful, resistant counterthrust that makes for tragedy is lacking. It is a world of victims.

American tragic dramatists. In little of the formal drama between the time of Ibsen, Strindberg, and Chekhov and the present are the full dimensions of tragedy presented. Some critics suggested that it was too late for tragedy, that modern man no longer valued himself highly enough, that too many sociological and ideological factors were working against the tragic temperament. The long and successful career of Eugene O'Neill may be a partial answer to this criticism. He has been called the first American to succeed in writing tragedy for the theatre, a fulfillment of his avowed purpose, for he had declared that in the tragic, alone, lay the meaning of life—and the hope. He sought in Freud's concept of the subconscious the equivalent of the Greek idea of fate and modelled his great trilogy, *Mourning Becomes Electra* (1931), on Aeschylus' *Oresteia.* Although the hovering sense of an ancient evil is powerful, the psychological conditioning controls the characters too nakedly. They themselves declare forces that determine their behaviour, so that they seem almost to connive in their own manipulation. *Desire Under the Elms* (1924) presents a harsh analysis of decadence in the sexual and avaricious intrigues of a New England farmer's family, unrelieved by manifestations of the transcendent human spirit. *The Great God Brown* (1926) and *Long Day's Journey into Night* (1939–41; first performance, 1956) come closer to true tragedy. In the latter, the capacity for self-knowledge is demonstrated by each member of the wrangling Tyrone family (actually, O'Neill's own; the play is frankly autobiographical). The insistent theme of the "death wish" (another example of Freud's influence), however, indicates too radical a pessimism for tragedy; even the character of Edmund Tyrone, O'Neill's own counterpart, confesses that he has always been a little in love with death, and in another late play, *The Iceman Cometh* (1939), the death wish is more strongly expressed. Although he never succeeded in establishing a tragic theatre comparable to the great theatres of the past, O'Neill made a significant contribution in his sustained concentration on subjects at least worthy of such a theatre. He made possible the significant, if slighter, contributions of Arthur Miller, whose *Death of a Salesman* (1949) and *A View from the Bridge* (1955) contain material of tragic potential that is not fully realized. Tennessee Williams' *Streetcar Named Desire* (1947) is a sensitive study of the breakdown of a character under social and psychological stress. As with Miller's plays, however, it remains in the area of pathos rather than tragedy.

O'Neill: pessimism too radical for tragedy

Other serious drama. The 20th century has produced much serious and excellent drama, which, though not in the main line of the tragic tradition, deserves mention. In British theatre, George Bernard Shaw's *Saint Joan* (1923) and T.S. Eliot's *Murder in the Cathedral* (1935) dramatized with great power both doubt and affirmation, the ambiguity of human motives, and the possibility of fruitless suffering that are true of the human condition as reflected by tragedy. During the Irish literary revival, the work of J.M. Synge (*Riders to the Sea,* 1904) and Sean O'Casey (*Shadow of a Gunman,* 1923), like Faulkner's work, sought a tragic theme in the destiny of a whole people. The masterpiece of this movement, however, is not a tragedy but a comic inversion of the ancient tragedy of *Oedipus*—Synge's *Playboy of the Western World* (1907).

Tragedy in works of social protest

The drama of social protest—exemplified in such works as the Russian Maksim Gorky's *Lower Depths* (1902), the German Bertolt Brecht's *Threepenny Opera* (1928) and *Mother Courage* (1941), and the American Clifford Odets' *Waiting for Lefty* (1935)—shares the tragedians' concern for evils that frustrate or destroy human values. The evils, however, are largely external, identifiable, and, with certain recommended changes in the social order, remediable. The type shows how vulnerable tragedy is to dogma or programs of any sort. A British author, George Orwell, suggested in *Nineteen Eighty-four* that tragedy would cease to exist under pure Marxist statism. Brecht's fine sense of irony and moral paradox redeem him from absolute dogmatism but give his work a hard satiric thrust that is inimical to tragedy. Traditional values and moral imperatives are all but neutralized in the existentialist worlds of the dramas and novels of Jean-Paul Sartre and Albert Camus, two outstanding philosopher-dramatists of the post World War II era. In their works, the protagonist is called upon to forge his own values, if he can, in a world in which the disparity between the ideal (what man longs for) and the real (what he gets) is so great as to reduce the human condition to incoherence and absurdity. Plays that led to the coinage of the term the theatre of the absurd are exemplified by *Waiting for Godot* (1952) and *The Killer* (1959), respectively by the Irish writer Samuel Beckett and the Romanian Eugène Ionesco, both of whom pursued their careers in Paris. Here, the theme of victimization is at its extreme, the despair and defeat almost absolute.

A coherent and affirmative view of man, society, and the cosmos is vital to tragedy—however tentative the affirmation may be. Unresolved questions remain at the end of every tragedy. There is always an irrational factor, disturbing, foreboding, not to be resolved by the sometime consolations of philosophy and religion or by any science of the mind or body; there is irretrievable loss, usually though not necessarily symbolized by the death of the hero. In the course of the action, however, in the development of character, theme, and situation and in the conceptual suggestiveness of language, tragedy presents the positive terms in which these questions might be answered. The human qualities are manifest, however limited; man's freedom is real, however marginal. The forces that bear him down may be mysterious but actual—fate, the gods, chance, the power of his own or the race's past working through his soul. Though never mastered, they can be contended with, defied, and, at least in spirit, transcended. The process is cognitive; man can learn.

Absence of tragedy in Oriental drama. In no way can the importance of a conceptual basis for tragedy be better illustrated than by a look at other drama-producing cultures with radically different ideas of the individual, his nature, and his destiny. While the cultures of India, China, and Japan have produced significant and highly artistic drama, there is little here to compare in magnitude, intensity, and freedom of form to the tragedies of the West.

In Buddhist teaching, the aim of the individual is to sup-

press and regulate all those questioning, recalcitrant, rebellious impulses that first impel the Western hero toward his tragic course. The goal of Nirvāṇa is the extinction of those impulses, the quieting of the passions, a kind of *quietus* in which worldly existence ceases. Western tragedy celebrates life, and the tragic hero clings to it: to him, it is never "sweet to die" for his country or for anything else, and the fascination for Western audiences is to follow the hero—as it were, *from the inside*—as he struggles to assert himself and his values against whatever would deny them. In Oriental drama, there is no such intense focus on the individual. In the Japanese Nō plays, for instance, the hero may be seen in moments of weariness and despair, of anger or confusion, but the mood is lyric, and the structure of the plays is ritualistic, with a great deal of choral intoning, dancing, and stylized action. Although a number of Nō plays can be produced together to fill a day's performance, the individual plays are very short, hardly the length of a Western one-act play. Nō plays affirm orthodoxy, rather than probing and questioning it, as Western tragedies do.

The drama in India has a long history, but there too the individual is subordinated to the mood of the idyll or romance or epic adventure. Perhaps one reason why the drama of India never developed the tragic orientation of the West is its removal from the people; it has never known the communal involvement of the Greek and Elizabethan theatres. Produced mainly for court audiences, an upper class elite, it never reflected the sufferings of common (or uncommon) humanity. Only recently has the drama in China embraced the vigour and realism of the common people, but the drama is in the service not of the individual but of a political ideology, which replaces the traditional themes of ancestor worship and filial piety. In all this, the mighty pageant figure—Oedipus, Prometheus, Lear, or Ahab standing for the individual as he alone sees and feels the workings of an unjust universe—is absent.

Tragedy in Nō drama

An example from the Nō plays will illustrate these generalizations. In *The Hoka Priests,* by Zenchiku Ujinobu (1414–99), a son is confronted with Hamlet's problem—*i.e.,* that of avenging the death of his father. He is uncertain how to proceed, since his father's murderer has many bold fellows to stand by him, while he is all alone. He persuades his brother, a priest, to help him, and disguising themselves as priests, they concoct a little plot to engage the murderer in religious conversation. There are a few words of lament—"Oh why,/ Why back to the bitter World/ Are we borne by our intent?"—and the Chorus sings lyrically about the uncertainties of life. The theme of the conversation is the unreality of the World and the reality of Thought. At an appropriate moment, the brothers cry, "Enough! Why longer hide our plot?" The murderer places his hat on the floor and exits. The brothers mime the killing of the murderer in a stylized attack upon the hat, while the Chorus describes and comments on the action: "So when the hour was come/ Did these two brothers/ By sudden resolution/ Destroy their father's foe./ For valour and piety are their names remembered/ Even in this aftertime" (translated by Arthur Waley, *The Nō Plays of Japan,* 1921).

Thus the Nō avoids directly involving the audience in the emotions implicit in the events portrayed on the stage. It gives only a slight hint of the spiritual struggle in the heart of the protagonist—a struggle that is always speedily resolved in favour of traditional teaching. In play after play the action does not take place before our eyes but is reenacted by the ghost of one of the participants. Thus, the events presented are tinged with memory or longing—hardly the primary emotions that surge through and invigorate Western tragedy at its best.

Loss of viability in the West. The absence, even in the West, of a great tragic theatre in the 20th century may be explained by the pantheon of panaceas to which modern man has subscribed. Politics, psychology, social sciences, physical sciences, nationalism, the occult—each offered a context in terms of which he might act out his destiny, were it not crowded out by the others. Modern man is not tested but harried and not by gods but, too often, by demons. In the dramas of Athens and England, tragedy was born of the impossibility of a clear-cut victory in man's struggle with powers greater than himself. In the modern drama, the struggle itself seems impossible.

The would-be hero is saved from a meaningful death by being condemned to a meaningless life. This, too, however, has its tragic dimension, in its illustration of the power of evil to survive from millennium to millennium in the presence or the absence of the gods.

Tragedy is a means of coming to terms with that evil. To assume that tragedy has lost viability is to forget that this viability was seriously questioned by the first Western philosopher to address himself to the problem. An account of the development of the theory of tragedy will reveal a resourcefulness in man's critical powers that can help to compensate, or occasionally even supersede, his lapsing creative powers. (R.B.S.)

THEORY OF TRAGEDY

Classical theories. As the great period of Athenian drama drew to an end at the beginning of the 4th century BC, Athenian philosophers began to analyze its content and formulate its structure. In the thought of Plato (*c.* 427–347 BC), the history of the criticism of tragedy began with speculation on the role of censorship. To Plato (in the dialogue on the *Laws*) the state was the noblest work of art, a representation (*mimēsis*) of the fairest and best life. He feared the tragedians' command of the expressive resources of language, which might be used to the detriment of worthwhile institutions. He feared, too, the emotive effect of poetry, the Dionysian element that is at the very basis of tragedy. Therefore, he recommended that the tragedians submit their works to the rulers, for approval, without which they could not be performed. It is clear that tragedy, by nature exploratory, critical, independent, could not live under such a regimen.

Ethics and art—Plato and Aristotle

Plato is answered, in effect and perhaps intentionally, by Aristotle's *Poetics.* Aristotle (384–322 BC) defends the purgative power of tragedy and, in direct contradiction to Plato, makes moral ambiguity the essence of tragedy. The tragic hero must be neither a villain nor a virtuous man but a "character between these two extremes, . . . a man who is not eminently good and just, yet whose misfortune is brought about not by vice or depravity, but by some error or frailty [*hamartia*]." The effect on the audience will be similarly ambiguous. A perfect tragedy, he says, should imitate actions that excite "pity and fear." He uses Sophocles' *Oedipus the King* as a paradigm. Near the beginning of the play, Oedipus asks how his stricken city (the counterpart of Plato's state) may cleanse itself, and the world he uses for the purifying action is a form of the word catharsis. The concept of catharsis provides Aristotle with his reconciliation with Plato, a means by which to satisfy the claims of both ethics and art. "Tragedy," says Aristotle, "is an imitation [*mimēsis*] of an action that is serious, complete and of a certain magnitude . . . through pity and fear effecting the proper purgation [catharsis] of these emotions." Ambiguous means may be employed, Aristotle maintains in contrast to Plato, to a virtuous and purifying end.

To establish the basis for a reconciliation between ethical and artistic demands, Aristotle insists that the principal element in the structure of tragedy is not character but plot. Since the erring protagonist is always in at least partial opposition to the state, the importance of tragedy lies not in him but in the enlightening event. "Most important of all," Aristotle said, "is the structure of the incidents. For tragedy is an imitation not of men but of an action and of life, and life consists in action, and its end is a mode of action, not a quality . . . ." Aristotle considered the plot to be the soul of a tragedy, with character in second place. The goal of tragedy is not suffering but the knowledge that issues from it, as the denouement issues from a plot. The most powerful elements of emotional interest in tragedy, according to Aristotle, are reversal of intention or situation (*peripeteia*) and recognition scenes (*anagnōrisis*), and each is most effective when it is coincident with the other. In *Oedipus,* for example, the messenger who brings Oedipus news of his real parentage, intending to allay his fears, brings about a sudden reversal of his fortune, from

happiness to misery, by compelling him to recognize that his wife is also his mother.

Later critics found justification for their own predilections in the authority of Greek drama and Aristotle. For example, the Roman poet Horace (65–8 BC), in his *Ars poetica* (*Art of Poetry*), elaborated the Greek tradition of extensively narrating offstage events into a dictum on decorum forbidding events such as Medea's butchering of her boys from being performed on stage. And where Aristotle had discussed tragedy as a separate genre, superior to epic poetry, Horace discussed it as a genre with a separate style, again with considerations of decorum foremost. A theme for comedy may not be set forth in verses of tragedy; each style must keep to the place alloted it.

On the basis of this kind of stylistic distinction, the *Aeneid,* the epic poem of Virgil, Horace's contemporary, is called a tragedy by the fictional Virgil in Dante's *Divine Comedy,* on the grounds that the *Aeneid* treats only of lofty things. Dante (1265–1321) calls his own poem a comedy partly because he includes "low" subjects in it. He makes this distinction in his *De vulgari eloquentia* (1304–05; "Of Eloquence in the Vulgar") in which he also declares the subjects fit for the high, tragic style to be salvation, love, and virtue. Despite the presence of these subjects in this poem, he calls it a comedy because his style of language is "careless and humble" and because it is in the vernacular tongue rather than Latin. Dante makes a further distinction:

> Comedy . . . differs from tragedy in its subject matter, in this way, that tragedy in its beginning is admirable and quiet, in its ending or catastrophe fould and horrible . . . From this it is evident why the present work is called a comedy.

Fate and will in comedy and tragedy

Dante's emphasis on the outcome of the struggle rather than on the nature of the struggle is repeated by Chaucer and for the same reason: their belief in the providential nature of human destiny. Like Dante, he was under the influence of *De consolatione philosophiae* (*Consolation of Philosophy*), the work of the 6th-century Roman philosopher Boethius (*c.* 480–524) that he translated into English. Chaucer considered Fortune to be beyond the influence of the human will. In his *Canterbury Tales,* he introduces "The Monk's Tale" by defining tragedy as "a certeyn storie . . . / of him that stood in greet prosperitee,/ And is y-fallen out of heigh degree/ Into miserie, and endeth wrecchedly." Again, he calls his *Troilus and Criseyde* a tragedy because, in the words of Troilus, "all that comth, comth by necessitee . . . / That forsight of divine purveyaunce/ Hath seyn alwey me to forgon Criseyde."

Elizabethan approaches. The critical tradition of separating the tragic and comic styles is continued by the Elizabethan English poet Sir Philip Sidney, whose *Defence of Poesie* (also published as *An Apologie for Poetrie*) has the distinction of containing the most extended statement on tragedy in the English Renaissance and the misfortune of having been written in the early 1580s (published 1595), before the first plays of Shakespeare, or even of Marlowe. Nevertheless, Sidney wrote eloquently of "high and excellent tragedy, that . . . with stirring the affects of admiration and commiseration teacheth the uncertainty of this world and upon how weak foundations gilden roofs are builded."

Since the word admiration here means awe, Sidney's "admiration and commiseration" are similar to Aristotle's "pity and fear." He differs from Aristotle, however, in preferring epic to tragic poetry. The Renaissance was almost as concerned as Plato with the need to justify poetry on ethical grounds, and Sidney ranks epic higher than tragedy because it provides morally superior models of behaviour.

Sidney goes further than mere agreement with Aristotle, however, in championing the unities of time and place. Aristotle had asserted the need for a unity of time: "Tragedy endeavors, as far as possible, to confine itself to a single revolution of the sun, or but slightly to exceed this limit." Sidney, following the lead of a 16th-century Italian Neoclassicist, Ludovico Castelvetro, added the unity of place: "the stage should always represent but one place, and the uttermost time presupposed in it should be, both by Aristotle's precept and common reason, but one day . . ." Sidney also seconds Horace's disapproval of the mingling of styles, which Sidney says produces a "mongrel tragicomedy."

Shakespeare's opinion of the relative merits of the genres is unknown, but his opinion of the problem itself may be surmised. In *Hamlet* he puts these words in the mouth of the foolish old pedant Polonius: "The best actors in the world, either for tragedy, comedy, history, pastoral, pastoral-comical, historical-pastoral, tragical-historical, tragical-comical-historical-pastoral; scene individable, or poem unlimited . . ." (Act II, scene 2). As to the classical unities, Shakespeare adheres to them only twice and neither time in a tragedy, in *The Comedy of Errors* and *The Tempest.* And through the mouths of his characters, Shakespeare, like Aristotle, puts himself on both sides of the central question of tragic destiny—that of freedom and necessity. Aristotle says that a tragic destiny is precipitated by the hero's tragic fault, his "error or frailty" (hamartia), but Aristotle also calls this turn of events a change of "fortune." Shakespeare's Cassius in *Julius Caesar* says, "The fault, dear Brutus, is not in our stars, / But in ourselves . . . ," and in King Lear, Edmund ridicules a belief in fortune as the "foppery of the world." But Hamlet, in a comment on the nature of hamartia, is a fatalist when he broods on the "mole of nature," the "one defect" that some men are born with, "wherein they are not guilty," and that brings them to disaster (Act I, scene 4). Similarly, Sophocles' Oedipus, though he says, "It was Apollo who brought my woes to pass," immediately adds, "it was my hand that struck my eyes." These ambiguities are a powerful source of the tragic emotion of Athenian and Elizabethan drama, unequalled by traditions that are more sure of themselves, such as French Neoclassicism, or less sure of themselves, such as 20th-century drama.

Neoclassical theory. In the Neoclassical period Aristotle's reasonableness was replaced by rationality, and his moral ambiguity by the mechanics of "poetic justice." In the 17th century, under the guise of a strict adherence to Classical formulas, additional influences were brought to bear on the theory of tragedy. In France, the theological doctrine of Jansenism, which called for an extreme orthodoxy, exercised a strong influence. In England, the restoration of the monarchy in 1660, with the reopening of the theatres, introduced a period of witty and lusty literature. In both nations, the influence of natural law—the idea that laws binding upon humanity are inferable from nature—increased, along with the influence of the exact sciences. Critics in both nations declared that Aristotle's "rules" were made to reduce nature into a method.

In his 1679 preface to Shakespeare's *Troilus and Cressida,* Dryden says, "we lament not, but detest a wicked man, we are glad when we behold his crimes are punished, and that Poetical justice is done upon him." Similar sentiments, calling for the punishment of crimes and the reward of virtue, were expressed in France. Catharsis had become vindication. Thomas Rymer, one of the most influential English critics of the time, in *The Tragedies of The Last Age* (1678), wrote that

Vindication rather than catharsis

> besides the purging of the passions, something must stick by observing . . . that necessary relation and chain, whereby the causes and the effects, the vertues and rewards, the vices and their punishments are proportion'd and link'd together, how deep and dark soever are laid the Springs, and however intricate and involv'd are their operations.

The effect was to rob tragedy of a great deal of its darkness and depth. The temper of the age demanded that mystery be brought to the surface and to the light, a process that had effects not merely different from but in part antipathetic to tragedy. Nicolas Boileau, the chief spokesman of the French Neoclassical movement, in his discussion of pity and fear in *Art Poétique* (1674), qualified these terms with the adjectives "beguiling" and "pleasant" (*pitié charmante, douce terreur*), which radically changed their meaning. The purged spectator became a grateful patient.

In his preface to *Phèdre* (1677), Racine subscribed to the *quid pro quo* view of retribution.

> I have written no play in which virtue has been more celebrated than in this one. The smallest faults are here severely punished; the mere idea of a crime is looked upon with as much horror as the crime itself.

Of Phèdre herself, his greatest heroine, he says,

> I have taken the trouble to make her a little less hateful than she is in the ancient versions of this tragedy, in which she herself resolves to accuse Hippolytus. I judged that that calumny had about it something too base and black to be put into the mouth of a Princess . . . This depravity seemed to me more appropriate to the character of a nurse, whose inclinations might be supposed to be more servile . . . .

For Aristotle, pity and fear made a counterpoint typical of Classicism, each tempering the other to create a balance. For Racine, pity and fear each must be tempered in itself. In the marginalia to his fragmentary translation of Aristotle's *Poetics*, Racine wrote that in arousing the passions of pity and fear, tragedy

> removes from them whatever they have of the excessive and the vicious and brings them back to a moderated condition and conformable to reason.

Corneille contradicted Aristotle outright. Discussing *Le Cid* he said, in *A Discourse on Tragedy* (1660),

> Our pity ought to give us fear of falling into similar misfortune, and purge us of that excess of love which is the cause of their disaster . . . but I do not know that it gives us that, or purges us, and I am afraid that the reasoning of Aristotle on this point is but a pretty idea . . . it is not requisite that these two passions always serve together . . . it suffices . . . that one of the two bring about the purgation. . . .

The accommodation of tragedy to Neoclassical ideas of order demanded a simplification of tragedy's complexities and ambiguities. The simplifying process was now inspired, however, by the fundamental tenet of all primitive scientific thought namely, that orderliness and naturalness are in a directly proportionate relationship. Racine declared the basis of the naturalistic effect in drama to be a strict adherence to the unities, which now seem the opposite of naturalistic. In his preface to *Bérénice* (1670), he asked what probability there could be when a multitude of things that would scarcely happen in several weeks are made to happen in a day. The illusion of probability, which is the Aristotelian criterion for the verisimilitude of a stage occurrence, is made to sound as if it were the result of a strict dramaturgical determinism, on the grounds that necessity is the truest path to freedom.

Racine and Corneille both contradicted Dante and Chaucer on the indispensability of a catastrophic final scene. "Blood and deaths," said Racine, are not necessary, for "it is enough that the action be grand, that the actors be heroic, that the passions be aroused" to produce "that stately sorrow that makes the whole pleasure of tragedy" (preface to *Bérénice*).

Milton was artistically much more conservative. He prefaced his *Samson Agonistes* (1671) with a warning against the

> error of intermixing Comic stuff with Tragic sadness and gravity; or introducing trivial and vulgar persons: which by all judicious hath been counted absurd; and brought in without discretion, corruptly to gratify the people.

He bypassed Shakespeare for the ancients and ranked Aeschylus, Sophocles, and Euripides as tragic poets unequalled yet by any others. Part of the rule, for Milton, was that which affirmed the unities. In his concurrence with the Classical idea of the purgative effect of pity and fear, Milton combined reactionary aesthetics with the scientific spirit of the recently formed Royal Society.

> Nor is Nature wanting in her own effects to make good his assertion [Aristotle on catharsis]: for so, in Physic things of melancholic hue and quality are used against melancholy, sour against sour, salt to remove salt humours.

Dryden spoke against a delimiting conception of either the genres or the unities. Speaking in the guise of Neander in *Of Dramatick Poesie, an Essay* (1668), he said that it was

> to the honour of our nation, that we have invented, increased, and perfected a more pleasant way of writing for the stage, than was ever known to the ancients or moderns of any nation, which is tragi-comedy.

The French dramatists, he felt, through their observance of the unities of time and place, wrote plays characterized by a dearth of plot and narrowness of imagination. Racine's approach to the question of probability was turned completely around by Dryden, who asked:

> How Many beautiful accidents might naturally happen in two or three days, which cannot arrive with any probability in the compass of twenty-four hours?

Johnson's definitive critique

The definitive critique of Neoclassical restrictions was not formulated, however, until the following century, when it was made by Samuel Johnson and was, significantly, part of his 1765 preface to Shakespeare, the first major step in the long process of establishing Shakespeare as the preeminent tragic poet of post-Classical drama. On genre he wrote:

> Shakespeare's plays are not in the rigorous and critical sense either tragedies or comedies, but compositions of a distinct kind; . . . expressing the course of the world, in which the loss of one is the gain of another; in which, at the same time, the reveller is hasting to his wine, and the mourner burying his friend . . . . That this is a practice contrary to the rules of criticism will be readily allowed; but there is always an appeal open from criticism to nature.

And on the unities:

> The necessity of observing the unities of time and place arises from the supposed necessity of making the drama credible. [But] the objection arising from the impossibility of passing the first hour at Alexandria, and the next at Rome, supposes, that when the play opens, the spectator really imagines himself at Alexandria . . . Surely he that imagines this may imagine more.

Johnson's appeal to nature was the essence of subsequent Romantic criticism.

Romantic theories. Lessing was the first important Romantic critic. He stated one of Romanticism's chief innovations in his *Hamburg Dramaturgy* (1767–69):

> The names of princes and heroes can lend pomp and majesty to a play, but they contribute nothing to our emotion. The misfortune of those whose circumstances most resemble our own, must naturally penetrate most deeply into our hearts, and if we pity kings, we pity them as human beings, not as kings.

Within a generation, revolutions in Europe and America offered social expression of this literary precept, and a dramatic tradition dominant for 22 centuries was upturned. From the time of Aristotle, who thought that the tragic hero should be highly renowned and prosperous, the tragic hero had been an aristocrat, if not a man of royal blood. With the exception of their minor or peripheral characters, the tragic dramas of Athens, England, and France told nothing of the destinies of the mass of mankind. All this was now changed.

But it is not certain that what was good for the revolution was good for tragedy. Coleridge in his critical writings of 1808–18 said that:

> there are two forms of disease most preclusive of tragic worth. The first [is] a sense and love of the ludicrous, and a diseased sensibility of the assimilating power . . . that in the boldest bursts of passion will lie in wait, or at once kindle into jest . . . . The second cause is matter of exultation to the philanthropist and philosopher, and of regret to the poet . . . . namely, the security, comparative equability, and ever-increasing sameness of human life.

In accord with this distaste for an excess of the mundane, Coleridge attacked the new German tragedies in which "the dramatist becomes a novelist *in his directions to the actors*, and degrades tragedy to pantomime." To describe, or rather indicate, what tragedy should ideally be, Coleridge said "it is not *a copy* of nature; but it is an imitation."

Coleridge's operative words and phrases in his discussions of tragedy were "innate," "from within," "implicit," "the being within," "the inmost heart," "our inward nature," "internal emotions," and "retired recesses." The new philosophical dispensation in Coleridge, like the new social dispensation in Lessing, reversed the old priorities; and where there were once princes there were now burghers, and where there were once the ordinances of God and the state there were now the dictates of the heart. By means of this reversal, Coleridge effected a reconciliation of the "tragedy of fate" and the "tragedy of character" in his description of the force of fate as merely the embodiment

Coleridge's reconciliation of fate and character

of an interior compulsion different in scale but not in kind from the interior compulsions of character. In Classical tragedy, he said the human "will" was "exhibited as struggling with fate, a great and beautiful instance and illustration of which is the Prometheus of Aeschylus; and the deepest effect is produced, when the fate is represented as a higher and intelligent will. . . ."

According to Coleridge, Shakespeare used the imaginative "variety" that characterizes man's inward nature in place of the mechanical regularity of the Neoclassical unities to produce plays that were "neither tragedies nor comedies, nor both in one, but a different genus, diverse in kind, not merely different in degree,—romantic dramas or dramatic romances." In his preoccupation with the mixture of genres and his distinction between the "mechanical" (Neoclassicism) and the "organic" (Shakespeare), Coleridge was influenced by *Lectures on Dramatic Art and Literature* (delivered 1808–09, published 1809–11), by August Wilhelm von Schlegel, perhaps the most influential of German Romantic critics.

Like Coleridge and most Romantic critics of tragedy, Schlegel found his champion in Shakespeare, and, also like them, he was preoccupied with the contrast between Classic and Romantic. Like Coleridge, Schlegel emphasized Shakespeare's inwardness, what Coleridge called his "implicit wisdom deeper even than our consciousness." It is in Shakespeare's most profound insights that Schlegel locates one of the principal distinctions between Classical and Shakespearean tragedy, in what he calls Shakespeare's "secret irony." The irony in *Oedipus the King* consists in the relation between the audience's knowledge of the protagonist's situation and his own ignorance of it. But Shakespeare's "readiness to remark the mind's fainter and involuntary utterances" is so great, says Schlegel, that "nobody ever painted so truthfully as he has done the facility of self-deception, the half self-conscious hypocrisy towards ourselves, with which even noble minds attempt to disguise the almost inevitable influence of selfish motives in human nature."

The irony Schlegel sees in Shakespeare's characterizations also extends to the whole of the action, as well as to the separate characters. In his discussion of it he suggests the reason for the difficulty of Shakespeare's plays and for the quarrelsome, irreconcilable "interpretations" among Shakespeare's commentators:

> Most poets who portray human events in a narrative or dramatic form take themselves apart, and exact from their readers a blind approbation or condemnation of whatever side they choose to support or oppose. . . . When, however, by a dexterous manoeuvre, the poet allows us an occasional glance at the less brilliant reverse of the medal, then he makes, as it were, a sort of secret understanding with the select circle of the more intelligent of his readers or spectators; he shows them that he had previously seen and admitted the validity of their tacit objections; that he himself is not tied down to the represented subject but soars freely above it. . . .

In Greek tragedy, the commentary by the chorus was an explicit and objective fact of the drama itself. In the presentation of Shakespeare's plays, such a commentary is carried on in the separate minds of the spectators, where it is diffused, silent, and not entirely sure of itself. When the spectators speak their minds after the curtain falls, it is not surprising that they often disagree.

In *Oedipus the King*, which Aristotle cited as the model of Classical tragedy, the irony of the protagonist's situation is evident to the spectator. In *Hamlet*, however, according to the American philosopher George Santayana, writing in 1908, it is the secret ironies, half-lights, and self-contradictions that make it the central creation of Romantic tragedy. As has been noted, Coleridge objected to the dramatist's giving directions to the actors, but part of the price of not having them is to deny to the audience as well an explicit indication of the playwright's meaning.

George Wilhelm Friedrich Hegel (1770–1831), the immensely influential German philospher, in his *Aesthetik* (1820–29), proposed that the sufferings of the tragic hero are merely a means of reconciling opposing moral claims. The operation is a success because of, not in spite of, the fact that the patient dies. According to Hegel's account of Greek tragedy, the conflict is not between good and evil but between goods that are each making too exclusive a claim. The heroes of ancient tragedy, by adhering to the *one* ethical system by which they molded their own personality, must come into conflict with the ethical claims of another. It is the moral one-sidedness of the tragic actor, not any negatively tragic fault in his morality or in the forces opposed to him, that proves his undoing, for both sides of the contradiction, if taken by themselves, are justified.

The nuclear Greek tragedy for Hegel is, understandably, Sophocles' *Antigone*, with its conflict between the valid claims of conscience (Antigone's obligation to give her brother a suitable burial) and law (King Creon's edict that enemies of the state should not be allowed burial). The two claims represent what Hegel regards as essentially concordant ethical claims. Antigone and Creon are, in this view, rather like pawns in the Hegelian dialectic—his theory that thought progresses from a thesis (*i.e.*, an idea), through an antithesis (an idea opposing the original thesis), to a synthesis (a more comprehensive idea that embraces both the thesis and antithesis), which in turn becomes the thesis in a further progression. At the end of *Antigone*, something of the sense of mutually appeased, if not concordant, forces does obtain after Antigone's suicide and the destruction of Creon's family. Thus, in contrast to Aristotle's statement that the tragic actors should represent not an extreme of good or evil but something between, Hegel would have them too good to live; that is, too extreme an embodiment of a particular good to survive in the world. He also tends to dismiss other traditional categories of tragic theory. For instance, he prefers his own kind of catharsis to Aristotle's—the feeling of *reconciliation*.

Tragedy as Hegelian dialectic

Hegel's emphasis on the correction of moral imbalances in tragedy is reminiscent of the "poetic justice" of Neoclassical theory, with its similar dialectic of crime and punishment. He sounds remarkably like Racine when he claims that, in the tragic denouement, the necessity of all that has been experienced by particular individuals is seen to be in complete accord with reason and is harmonized on a true ethical basis. But where the Neoclassicists were preoccupied with the unities of time and place, Hegel's concerns, like those of other Romantics, are inward. For him, the final issue of tragedy is not the misfortune and suffering of the tragic antagonists but rather the satisfaction of spirit arising from "reconciliation." Thus, the workings of the spirit, in Hegel's view, are subject to the rationalistic universal laws.

Hegel's system is not applicable to Shakespearean or Romantic tragedy. Such Shakespearean heroes as Macbeth, Richard III, and Mark Antony cannot be regarded as embodiments of any transcendent good. They behave as they do, says Hegel, now speaking outside of his scheme of tragedy, simply because they are the kind of men they are. In a statement pointing up the essence of uninhibited romantic lust and willfulness Hegel said: "it is the inner experience of their heart and individual emotion, or the particular qualities of their personality, which insist on satisfaction."

The traditional categories of tragedy are nearly destroyed in the deepened subjectivities of Romanticism of the 19th-century German philosophers, Arthur Schopenhauer and his disciple Friedrich Nietzsche. In Schopenhauer's *Die Welt als Wille und Vorstellung* (1819; *The World as Will and Idea*), much more than the social or ethical order is upturned. In place of God, the good, reason, soul, or heart, Schopenhauer installs the will, as reality's true inner nature, the metaphysical to everything physical in the world. In Schopenhauer, there is no question of a Hegelian struggle to achieve a more comprehensive good. There is rather the strife of will with itself, manifested by fate in the form of chance and error and by the tragic personages themselves. Both fate and men represent one and the same will, which lives and appears in them all. Its individual manifestations, however, in the form of such phenomena as chances, errors, or men, fight against and destroy each other.

Schopenhauer accordingly rejects the idea of poetic justice: "the demand for so-called poetical justice rests on en-

tire misconception of the nature of tragedy, and, indeed, of the nature of the world itself . . . . The true sense of tragedy is the deeper insight, that it is not his own individual sins that the hero atones for, but original sin, *i.e.*, the crime of existence itself. . . ." Schopenhauer distinguishes three types of tragic representation: (1) "by means of a character of extraordinary wickedness . . . who becomes the author of the misfortune"; (2) "blind fate—*i.e.*, chance and error" (such as the title characters in Shakespeare's *Romeo and Juliet* and "most of the tragedies of the ancients"); and (3) when "characters of ordinary morality . . . are so situated with regard to each other that their position compels them, knowingly and with their eyes open, to do each other the greatest injury, without any one of them being entirely in the wrong" (such as, "to a certain extent," *Hamlet*).

Schopenhauer's three types

This last kind of tragedy seems to Schopenhauer far to surpass the other two. His reason, almost too grim to record, is that it provides the widest possible play to the destructive manifestations of the will. It brings tragedy, so to speak, closest to home.

Schopenhauer finds tragedy to be the summit of poetical art, because of the greatness of its effect and the difficulty of its achievement. According to Schopenhauer, the egoism of the protagonist is purified by suffering almost to the purity of nihilism. His personal motives become dispersed as his insight into them grows; "the complete knowledge of the nature of the world, which has a quieting effect on the will, produces resignation, the surrender not merely of life, but of the very will to live."

Schopenhauer's description has limited application to tragic denouements in general. In the case of his own archetypal hero, the hero's end seems merely the mirror image of his career, an oblivion of resignation or death that follows an oblivion of violence. Instead of a dialogue between higher and lower worlds of morality or feeling (which take place even in Shakespeare's darkest plays), Schopenhauer posits a succession of states as helpless in knowledge as in blindness. His "will" becomes a synonym for all that is possessed and necessity-ridden.

Nietzsche's division of tragedy in two elements

Nietzsche's *Geburt der Tragödie aus dem Geiste der Musik* (1872) was deeply influenced by Schopenhauer. The two elements of tragedy, says Nietzsche, are the Apollonian (related to the Greek god Apollo, here used as a symbol of measured restraint) and the Dionysian (from Dionysus, the Greek god of ecstasy). His conception of the Apollonian is the equivalent of what Schopenhauer called the individual phenomenon—the particular chance, error, or man, the individuality of which is merely a mask for the essential truth of reality which it conceals. The Dionysian element is a sense of universal reality, which, according to Schopenhauer, is experienced after the loss of individual egoism. The "Dionysian ecstasy," as defined by Nietzsche, is experienced "not as individuals but as the *one* living being, with whose creative joy we are united."

Nietzsche dismisses out of hand one of the most venerable features of the criticism of tragedy, the attempt to reconcile the claims of ethics and art. He says that the events of a tragedy are "supposed" to discharge pity and fear and are "supposed" to elevate and inspire by the triumph of noble principles at the sacrifice of the hero. But art, he says, must demand purity within its own sphere. To explain tragic myth, the first requirement is to seek the pleasure that is peculiar to it in the purely aesthetic sphere, without bringing in pity, fear, or the morally sublime.

The essence of this specifically aesthetic tragic effect is that it both reveals and conceals, causing both pain and joy. The drama's exhibition of the phenomena of suffering individuals (Apollonian elements) forces upon the audience "the struggle, the pain, the destruction of phenomena," which in turn communicates "the exuberant fertility of the universal." The spectators then "become, as it were, one with the infinite primordial joy in existence, and . . . we anticipate, in Dionysian ecstasy, the indestructibility and eternity of this joy." Thus, he says, there is a desire "to see tragedy and at the same time to get beyond all seeing . . . to hear and at the same time long to get beyond all hearing."

The inspired force of Nietzsche's vision is mingled with a sense of nihilism:

> "only after the spirit of science has been pursued to its limits, . . . may we hope for a rebirth of tragedy . . . I understand by the spirit of science the faith that first came to light in the person of Socrates—the faith in the explicability of nature and in knowledge as a panacea."

Nietzsche would replace the spirit of science with a conception of existence and the world as an aesthetic phenomenon and justified only as such. Tragedy would enjoy a prominent propagandistic place. It is "precisely the tragic myth that has to convince us that even the ugly and disharmonic are part of an artistic game that the will in the eternal amplitude of its pleasure plays with itself." And, consummately: "we have art in order that we may not perish through truth."

Tragedy in music. Musical dissonance was Nietzsche's model for the double effect of tragedy. The first edition of his book was titled *The Birth of Tragedy out of the Spirit of Music*, another influence from Schopenhauer, for whom music differed from all the other arts in that it is not a copy of a phenomenon but the direct copy of the will itself. He even called the world "embodied music, . . . embodied will." Nietzsche's theorizing on the relation of the tragic theme to art forms other than the drama was in fact confirmed in such operas as Mussorgsky's version of Pushkin's tragedy *Boris Godunov*, Verdi's of *Macbeth* and *Othello*, and Gounod's *Faust*. In contrast to these resettings of received forms, Wagner, Verdi, and Bizet achieved a new kind of tragic power for Romanticism in the theme of the operatic love-death in, respectively, *Tristan and Isolde*, *Aida*, and *Carmen*. Thus, the previous progression of the genre from tragedy to tragicomedy to romantic tragedy continued to a literary–musical embodiment of what Nietzsche called "tragic dithyrambs."

An earlier prophecy than Nietzsche's regarding tragedy and opera was made by the German poet Friedrich von Schiller in a letter of 1797 to Goethe:

> I have always trusted that out of opera, as out of the choruses of the ancient festival of Bacchus, tragedy would liberate itself and develop in a nobler form. In opera, servile imitation of nature is dispensed with . . . here is . . . the avenue by which the ideal can steal its way back into the theatre.

20th-century critical theory. In the 20th century, discussion of tragedy was sporadic until the aftermath of World War II. Then it enjoyed new vigour, perhaps to compensate for, or help explain, the dearth of genuine tragic literature, either in the novel or in the theatre. In the 1950s and 1960s countless full-length studies, articles, and monographs variously sought the essence, the vision, the view of life, or the spirit of tragedy out of a concern for the vital culture loss were the death of tragedy to become a reality. They also attempted to mediate the meaning of tragedy to a public that was denied its reality, save in revivals or an occasional approximation. Since the Romantic critics first ventured beyond the Aristotelean categories to consider tragedy, or the tragic, as a sense of life, there was an increasing tendency to regard tragedy not merely as drama but as a philosophical form. It is noteworthy that the Spanish philosopher Miguel de Unamuno's influential book, *The Tragic Sense of Life* (1921), barely mentions the formal drama.

From the time of Aristotle, tragedy has achieved importance primarily as a medium of self-discovery—the discovery of man's place in the universe and in society. That is the main concern of Aristotle in his statements about reversal, recognition, and catharsis, though it remained for the Romantic critics to point it out. The loss of this concern in the facile plays of the 19th and 20th centuries resulted in the reduction of tragic mystery to confused sentimentalism. Critics of the 20th century, being less certain even than Schopenhauer or Nietzsche of what man's place in the scheme of things may be, experimented with a variety of critical approaches, just as contemporary dramatists experimented with various "theatres." Although these critics lacked the philosophical certainties of earlier theorists, they had a richer variety of cultures and genres to instruct them. The hope of both critics and dramatists was that this multiplicity would produce not mere impressionism or haphazard eclecticism but new form and new meaning.

(L.C.)

OTHER GENRES

Satire

"Satire" is a protean term. Together with its derivatives, it is one of the most heavily worked literary designations and one of the most imprecise. The great English lexicographer Samuel Johnson defined satire as "a poem in which wickedness or folly is censured," and more elaborate definitions are rarely more satisfactory. No strict definition can encompass the complexity of a word that signifies, on one hand, a kind of literature—as when one speaks of the satires of the Roman poet Horace or calls the American novelist Nathanael West's *A Cool Million* a satire—and, on the other, a mocking spirit or tone that manifests itself in many literary genres but can also enter into almost any kind of human communication. Wherever wit is employed to expose something foolish or vicious to criticism, there satire exists, whether it be in song or sermon, in painting or political debate, on television or in the movies. In this sense satire is everywhere. Although this section deals primarily with satire as a literary phenomenon, it records its manifestations in a number of other areas of human activity.

THE NATURE OF SATIRE

Historical definitions. The terminological difficulty is pointed up by a phrase of the Roman rhetorician Quintilian: "satire is wholly our own" ("satura tota nostra est"). Quintilian seems to be claiming satire as a Roman phenomenon, although he had read the Greek dramatist Aristophanes and was familiar with a number of Greek forms that one would call satiric. But the Greeks had no specific word for satire; and by *satura* (which meant originally something like "medley" or "miscellany" and from which comes the English "satire") Quintilian intended to specify that kind of poem "invented" by Lucilius, written in hexameters on certain appropriate themes, and characterized by a Lucilian–Horatian tone. *Satura* referred, in short, to a poetic form, established and fixed by Roman practice. (Quintilian mentions also an even older kind of satire written in prose by Marcus Terentius Varro and, one might add, by Menippus and his followers Lucian and Petronius.) After Quintilian's day *satura* began to be used metaphorically to designate works that were "satirical" in tone but not in form. As soon as a noun enters the domain of metaphor, as one modern scholar has pointed out, it clamours for extension; and *satura* (which had had no verbal, adverbial, or adjectival forms) was immediately broadened by appropriation from the Greek word for "satyr" (*satyros*) and its derivatives. The odd result is that the English "satire" comes from the Latin *satura;* but "satirize," "satiric," etc., are of Greek origin. By about the 4th century AD the writer of satires came to be known as *satyricus;* St. Jerome, for example, was called by one of his enemies "a satirist in prose" ("satyricus scriptor in prosa"). Subsequent orthographic modifications obscured the Latin origin of the world satire: *satura* becomes *satyra,* and in England, by the 16th century, it was written "satyre."

Satire and satyr

Elizabethan writers, anxious to follow Classical models but misled by a false etymology, believed that "satyre" derived from the Greek satyr play: satyrs being notoriously rude, unmannerly creatures, it seemed to follow that "satyre" should be harsh, coarse, rough. The English author Joseph Hall wrote:

> The Satyre should be like the Porcupine,
> That shoots sharpe quils out in each angry line,
> And wounds the blushing cheeke, and fiery eye,
> Of him that heares, and readeth guiltily.
> (*Virgidemiarum,* V, 3, 1–4.)

The false etymology that derives satire from satyrs was finally exposed in the 17th century by the Classical scholar Isaac Casaubon; but the old tradition has aesthetic if not etymological appropriateness and has remained strong.

In the prologue to his book, Hall makes a claim that has caused confusion like that following from Quintilian's remark on Roman satire. Hall boasts:

> I first adventure: follow me who list,
> And be the second English Satyrist.

But Hall knew the satirical poems of Geoffrey Chaucer and John Skelton, among other predecessors, and probably meant that he was the first to imitate systematically the formal satirists of Rome.

Influence of Horace and Juvenal. By their practice, the great Roman poets Horace and Juvenal set indelibly the lineaments of the genre known as the formal verse satire and, in so doing, exerted pervasive, if often indirect, influence on all subsequent literary satire. They gave laws to the form they established, but it must be said that the laws were very loose indeed. Consider, for example, style. In three of his Satires (I, iv; I, x; II, i) Horace discusses the tone appropriate to the satirist who out of a moral concern attacks the vice and folly he sees around him. As opposed to the harshness of Lucilius, Horace opts for mild mockery and playful wit as the means most effective for his ends. Although I portray examples of folly, he says, I am not a prosecutor and I do not like to give pain; if I laugh at the nonsense I see about me, I am not motivated by malice. The satirist's verse, he implies, should reflect this attitude: it should be easy and unpretentious, sharp when necessary, but flexible enough to vary from grave to gay. In short, the character of the satirist as projected by Horace is that of an urbane man of the world, concerned about folly, which he sees everywhere, but moved to laughter rather than rage.

Horace's concept of the satirist

Juvenal, over a century later, conceives the satirist's role differently. His most characteristic posture is that of the upright man who looks with horror on the corruptions of his time, his heart consumed with anger and frustration. Why does he write satire? Because tragedy and epic are irrelevant to his age. Viciousness and corruption so dominate Roman life that for an honest man it is difficult *not* to write satire. He looks about him, and his heart burns dry with rage; never has vice been more triumphant. How can he be silent (*Satires,* I)? Juvenal's declamatory manner, the amplification and luxuriousness of his invective, are wholly out of keeping with the stylistic prescriptions set by Horace. At the end of the scabrous sixth satire, a long, perfervid invective against women, Juvenal flaunts his innovation: in this poem, he says, satire has gone beyond the limits established by his predecessors; it has taken to itself the lofty tone of tragedy.

The results of Juvenal's innovation have been highly confusing for literary history. What *is* satire if the two poets universally acknowledged to be supreme masters of the form differ so completely in their work as to be almost incommensurable? The formulation of the English poet John Dryden has been widely accepted. Roman satire has two kinds, he says: comical satire and tragical satire, each with its own kind of legitimacy. These denominations have come to mark the boundaries of the satiric spectrum, whether reference is to poetry or prose or to some form of satiric expression in another medium. At the Horatian end of the spectrum, satire merges imperceptibly into comedy, which has an abiding interest in the follies of men but has not satire's reforming intent. The distinction between the two modes, rarely clear, is marked by the intensity with which folly is pursued: fops and fools and pedants appear in both, but only satire tries to mend men through them. And, although the great engine of both comedy and satire is irony, in satire, as the 20th-century critic Northrop Frye has said, irony is militant.

Comical satire and tragical satire

Boileau, Dryden, and Alexander Pope, writing in the 17th and 18th centuries—the modern age of satire—catch beautifully, when they like, the deft Horatian tone; however, satire's wit can also be sombre, deeply probing, and prophetic, as it explores the ranges of the Juvenalian end of the satiric spectrum, where satire merges with tragedy, melodrama, and nightmare. Pope's *Dunciad* ends with these lines:

> Lo! thy dread Empire, CHAOS! is restor'd;
> Light dies before thy uncreating word:

> Thy hand, great Anarch! lets the curtain fall;
> And Universal Darkness buries All.

It is the same darkness that falls on Book IV of Jonathan Swift's *Gulliver's Travels*, on some of Mark Twain's satire—*The Mysterious Stranger*, *To The Person Sitting in Darkness*—and on George Orwell's *1984*.

Structure of verse satire. Roman satire is hardly more determinate in its structure than in its style; the poems are so haphazardly organized, so randomly individual, that there seems little justification for speaking of them as a literary kind at all. Beneath the surface complexity of the poems, however, there exists, as one modern scholar has pointed out, a structural principle common to the satires of the Roman poets and their French and English followers. These poems have a bipartite structure: a thesis part, in which some vice or folly is examined critically from many different angles and points of view, and an antithesis part, in which an opposing virtue is recommended. The two parts are disproportionate in length and in importance, for satirists have always been more disposed to castigate wickedness than exhort to virtue.

Most verse satires are enclosed by a "frame." Just as a novel by the early-20th-century writer Joseph Conrad may be framed by a situation in which his narrator sits on a veranda in the tropics, telling his tale, stimulated into elaboration by the queries of his listeners, so the satire will be framed by a conflict of sorts between the satirist (or, more reasonably, his persona, a fictive counterpart, the "I" of the poem) and an adversary. Usually the adversary has a minor role, serving only to prod the speaker into extended comment on the issue (vice or folly) at hand; he may be sketchily defined, or he may be as effectively projected as Horace's Trebatius (*Satires*, II, i) or his awful bore (I, vi) or his slave Davus, who turns the tables on his master (II, vii). Similarly, the background against which the two talk may be barely suggested, or it may form an integral part of the poem, as in Horace's "Journey to Brundisium" (I, v) or in Juvenal's description of the valley of Egeria, where Umbricius unforgettably pictures the turbulence and decadence of Rome (*Satires*, III). In any event, the frame is usually there, providing a semidramatic situation in which vice and folly may reasonably be dissected.

Literary and rhetorical devices

The satirist has at his disposal an immense variety of literary and rhetorical devices: he may use beast fables, dramatic incidents, fictional experiences, imaginary voyages, character sketches, anecdotes, proverbs, homilies; he may employ invective, sarcasm, burlesque, irony, mockery, raillery, parody, exaggeration, understatement—wit in any of its forms—anything to make the object of attack abhorrent or ridiculous. Amid all this confusing variety, however, there is pressure toward order—internally, from the arraignment of vice and appeal to virtue, and externally, from the often shadowy dramatic situation that frames the poem.

The satiric spirit. Thus, although the formal verse satire of Rome is quantitatively a small body of work, it contains most of the elements later literary satirists employ. When satire is spoken of today, however, there is usually no sense of formal specification whatever; one has in mind a work imbued with the satiric spirit—a spirit that appears (whether as mockery, raillery, ridicule, or formalized invective) in the literature or folklore of all peoples, early and late, preliterate and civilized. According to Aristotle (*Poetics*, IV, 1448b–1449a), Greek Old Comedy developed out of ritualistic ridicule and invective—out of satiric utterances, that is, improvised and hurled at individuals by the leaders of the phallic songs. The function of these "iambic" utterances, it has been shown, was magical; they were thought to drive away evil influences so that the positive fertility magic of the phallus might be operative.

Power of ancient satire

This early connection of primitive "satire" with magic has a remarkably widespread history.

In the 7th century BC, the poet Archilochus, said to be the "first" Greek literary satirist, composed verses of such potency against his prospective father-in-law, Lycambes, that Lycambes and his daughter hanged themselves. In the next century the sculptors Bupalus and Athenis "knit their necks in halters," it is said, as a result of the "bitter rimes and biting libels" issued by the satirical poet Hipponax. Similar tales exist in other cultures. The chief function of the ancient Arabic poet was to compose satire (*hijā'*) against the tribal enemy. The satires were thought always to be fatal, and the poet led his people into battle, hurling his verses as he would hurl a spear. Old Irish literature is laced with accounts of the extraordinary power of the poets, whose satires brought disgrace and death to their victims:

> . . . saith [King] Lugh to his poet, "what power can *you* wield in battle?"
> "Not hard to say," quoth Carpre. . . ."I will satirize them, so that through the spell of my art they will not resist warriors."
> ("The Second Battle of Moytura," trans. by W. Stokes, *Revue Celtique*, XII [1891], 52–130.)

According to saga, when the Irish poet uttered a satire against his victim, three blisters would appear on the victim's cheek, and he would die of shame. One story will serve as illustration: after Deirdriu of the Sorrows came to her unhappy end, King Conchobar fell in love again—this time with the lovely Luaine. They were to be married; but, when the great poet Aithirne the Importunate and his two sons (also poets) saw Luaine, they were overcome with desire for her. They went to Luaine and asked her to sleep with them. She refused. The poets threatened to satirize her. And the story says:

> The damsel refused to lie with them. So then they made three satires on her, which left three blotches on her cheeks, to wit, Shame and Blemish and Disgrace . . . . Thereafter the damsel died of shame. . . .
> ("The Wooing of Luaine . . . ," trans. by W. Stokes, *Revue Celtique*, XXIV [1903], 273–85.)

An eminent 20th-century authority on these matters adduces linguistic, thematic, and other evidence to show a functional relation between primitive "satire," such as that of Carpre and Aithirne, and the "real" satire of more sophisticated times. Today, among various preliterate peoples the power of personal satire and ridicule is appalling; among the Ashanti of West Africa, for example, ridicule is (or was recently) feared more than almost any other humanly inflicted punishment, and suicide is frequently resorted to as an escape from its terrors. Primitive satire such as that described above can hardly be spoken of in literary terms; its affiliations are rather with the magical incantation and the curse.

SATIRICAL MEDIA

Literature. When the satiric utterance breaks loose from its background in ritual and magic, as in ancient Greece (when it is free, that is, to develop in response to literary stimuli rather than the "practical" impulsions of magic), it is found embodied in an indefinite number of literary forms that profess to convey moral instruction by means of laughter, ridicule, mockery; the satiric spirit proliferates everywhere, adapting itself to whatever mode (verse or prose) seems congenial. Its targets range from one of Pope's dunces to the entire race of man, as in *Satyr Against Mankind* (1675), by John Wilmot, the earl of Rochester, from Erasmus' attack on corruptions in the church to Swift's excoriation of all civilized institutions in *Gulliver's Travels*. Its forms are as varied as its victims: from an anonymous medieval invective against social injustice to the superb wit of Chaucer and the laughter of Rabelais; from the burlesque of Luigi Pulci to the scurrilities of Pietro Aretino and the "black humour" of Lenny Bruce; from the flailings of John Marston and the mordancies of Francisco Gómez de Quevedo y Villegas to the bite of Jean de La Fontaine and the great dramatic structures of Ben Jonson and Molière; from an epigram of Martial to the fictions of Nikolay Gogol and of Günter Grass and the satirical utopias of Yevgeny Zamyatin, Aldous Huxley, and Orwell.

It is easy to see how the satiric spirit would combine readily with those forms of prose fiction that deal with the ugly realities of the world but that satire should find congenial a genre such as the fictional utopia seems odd. From the publication of Thomas More's eponymous *Utopia* (1516), however, satire has been an important ingredient of utopian fiction. More drew heavily on the satire of Horace, Juvenal, and Lucian in composing his

Use of satire in fictional utopias

great work. For example, like a poem by Horace, *Utopia* is framed by a dialogue between "Thomas More" (the historical man a character in his own fiction) and a seafaring philosopher named Raphael Hythloday. The two talk throughout a long and memorable day in a garden in Antwerp. "More's" function is to draw Hythloday out and to oppose him on certain issues, notably his defense of the communism he found in the land of Utopia. "More" is the adversary. Hythloday's role is to expound on the institutions of Utopia but also to expose the corruption of contemporary society. Thus he functions as a satirist. Here Hythloday explains why Englishmen, forced off their land to make way for sheep, become thieves:

> Forsooth . . . your sheep that were wont to be so meek and tame and so small eaters, now as I hear say, be become so great devourers and so wild, that they eat up and swallow down the very men themselves. They consume, destroy, and devour whole fields, houses, and cities. For look in what parts of the realm doth grow the finest and therefore dearest wool, there noblemen and gentlemen, yea and certain abbots, holy men no doubt, not contenting themselves with the yearly revenues and profits that were wont to grow to their forefathers and predecessors of their lands, nor being content that they live in rest and pleasure nothing profiting, yea, much annoying the weal-public, leave no ground for tillage. They enclose all into pastures; they throw down houses; they pluck down towns and leave nothing standing but only the church to be made a sheep-house.
>
> (More's *Utopia,* Everyman edition, 1951.)

Here are characteristic devices of the satirist, dazzlingly exploited: the beast fable compressed into the grotesque metaphor of the voracious sheep; the reality-destroying language that metamorphoses gentlemen and abbots into earthquakes and a church into a sheep barn; the irony coldly encompassing the passion of the scene. Few satirists of any time could improve on this.

Just as satire is a necessary element of the work that gave the literary form utopia its name, so the utopias of Lilliput, Brobdingnag, and Houyhnhnmland are essential to the satire of More's great follower Jonathan Swift. He sent Gulliver to different lands from those Hythloday discovered, but Gulliver found the same follies and the same vices, and he employed a good many of the same rhetorical techniques his predecessor had used to expose them. *Gulliver's Travels,* as one scholar points out, is a salute across the centuries to Thomas More. With this kind of precedent, it is not surprising that in the 20th century, when utopia turns against itself, as in Aldous Huxley's *Brave New World* (1932), the result is satire unrelieved.

Drama. The drama has provided a favourable environment for satire ever since it was cultivated by Aristophanes, working under the extraordinarily open political conditions of 5th-century Athens. In a whole series of plays—*The Clouds, The Frogs, Lysistrata,* and many others—Aristophanes lampoons the demagogue Cleon by name, violently attacks Athenian war policy, derides the audience of his plays for their gullible complacency, pokes fun at Socrates as representative of the new philosophical teaching, stages a brilliantly parodic poetic competition between the dramatists Aeschylus and Euripides in Hades, and in general lashes out at contemporary evils with an uninhibited and unrivalled inventiveness. But the theatre has rarely enjoyed the political freedom Aristophanes had—one reason, perhaps, that satire more often appears in drama episodically or in small doses than in the full-blown Aristophanic manner. In Elizabethan England, Ben Jonson wrote plays that he called "comicall satyres"—*Every Man Out of His Humour, Poetaster*—and there are substantial elements of satire in Shakespeare's plays—some in the comedies, but more impressively a dark and bitter satire in *Timon of Athens, Troilus and Cressida, Hamlet,* and *King Lear.* The 17th-century comedy of Molière sometimes deepens into satire, as with the exposure of religious hypocrisy in *Tartuffe* or the railing against social hypocrisy by Alceste in *The Misanthrope.* George Bernard Shaw considered himself a satirist. He once compared his country's morals to decayed teeth and himself to a dentist, obliged by his profession to give pain in the interests of better health. Yet, as inventive and witty as Shaw is, compared to the 20th-century German playwright Bertolt Brecht, whose anatomizing of social injustice cuts deep, Shaw is a gentle practitioner indeed.

Aristophanes' use of satire

Motion pictures and television. The movies have sometimes done better by satire than the theatre, and it is in the movies that an ancient doctrine having to do with principles of decorum in the use of satire and ridicule has been exploded. The English novelist Henry Fielding was reflecting centuries of tradition when, in the preface to *Joseph Andrews* (1742), he spoke of the inappropriateness of ridicule applied to black villainy or dire calamity. "What could exceed the absurdity of an Author, who should write *the Comedy of* Nero, *with the merry Incident of ripping up his Mother's Belly?*" Given this point of view, Hitler seems an unlikely target for satire; yet in *The Great Dictator* (1940) Charlie Chaplin managed a successful, if risky, burlesque. Chaplin has written, however, that, determined as he was to ridicule the Nazi notions of a superrace, if he had known of the horrors of the concentration camps, he could not have made the film. Stanley Kubrick's *Dr. Strangelove; or, How I Learned to Stop Worrying and Love the Bomb* (1964) denies all limitation; through some alchemy Kubrick created an immensely funny, savagely satirical film about the annihilation of the world. A combination of farce and nightmare, *Dr. Strangelove* satirizes military men, scientists, statesmen—the whole ethos of the technological age—in the most mordant terms; it shows the doomsday blast, yet leaves audiences laughing. "You can't fight in here," says the president of the United States as doom nears, "this is the War Room." The film's tone is less didactic than in most powerful satire—the mushroom cloud carries its own moral—yet satire's full force is there.

Television has not proved a notably receptive medium. *That Was the Week That Was,* a weekly satirical review started in England in 1962, had remarkable success for a time but succumbed to a variety of pressures, some of them political; when a version of the program was attempted in the United States, it was emasculated by restrictions imposed by sponsors fearful of offending customers and by program lawyers wary of libel suits. Jonathan Swift said that he wrote to vex the world rather than divert it; it is not an attitude calculated to sell soap.

Festivals. Yet satire does much more than vex, and even in Swift's work there is a kind of gaiety that is found in many nonliterary manifestations of the satirical spirit. Satire always accompanies certain festivals, for example, particularly saturnalian festivals. Many different cultures set aside a holiday period in which customary social restraints are abandoned, distinctions of rank and status are turned upside down, and institutions normally sacrosanct are subjected to ridicule, mockery, burlesque. The Romans had their Saturnalia, the Middle Ages its Feast of Fools; and in the 20th century many countries still have annual carnivals (Fasching in Austria, the Schnitzelbank in Basel, Switzerland, for example) at which, amid other kinds of abandon, an extraordinary freedom of satirical utterance is permitted. Even in Africa among the Ashanti, for whom ridicule has such terrors, there is a festival during which the sacred chief himself is satirized. "Wait until Friday," said the chief to the enquiring anthropologist, "when the people really begin to abuse me, and if you will come and do so too it will please me." Festivals such as these provide sanctioned release from social inhibition and repression, and, in these circumstances, satire directed at men in power or at taboo institutions acts as a safety valve for pent-up frustrations.

The gaiety of satire

Satire may often function this way. A story is told that the 16th-century pope Adrian VI was highly offended at satirical verses written against him and affixed to Pasquino's statue (a famous repository for lampoons in Rome), but he became a willing target once he realized that his enemies vented otherwise dangerous hostility in this relatively harmless manner. Similar mechanisms operate today when, at a nightclub or theatre, audiences listen to satirical attacks on political figures or on issues such as racial discrimination, identify with the satirist, laugh at his wit, and thereby discharge their own aggressive feelings. Satire of this order

is a far cry, of course, from that written by a Swift or Voltaire, whose work can be said to have a revolutionary effect.

Caricature and cartoon

Visual arts. The critique of satire may be conveyed even more potently in the visual arts than by way of the spoken or written word. In caricature and in what came to be known as the cartoon, artists since the Renaissance have left a wealth of startlingly vivid commentary on the men and events of their time. The names alone evoke their achievement: in England, William Hogarth, Thomas Rowlandson, Sir John Tenniel, and Sir Max Beerbohm; in France, Charles Philipon (whose slow-motion metamorphosis of King Louis-Philippe into a *poire*—that is, "fathead," or "fool"—is classic) and Honoré Daumier; in Spain, Francisco Goya, and out of Spain, Pablo Picasso; and among recent political cartoonists, Sir David Low, Vicky (Victor Welsz), Herblock (Herbert Block), and Conrad.

The favourite medium of such individuals is the black-and-white print in which the satirical attack is pointed up by a brief verbal caption. The social impact of their art is incalculable. Dictators recognize this all too well, and in times of social tension political cartoonists are among the first victims of the censor.

THE SATIRIST, THE LAW, AND SOCIETY

Indeed, the relations of satirists to the law have always been delicate and complex. Both Horace and Juvenal took extraordinary pains to avoid entanglements with authority—Juvenal ends his first satire with the self-protective announcement that he will write only of the dead. In England in 1599 the Archbishop of Canterbury and the Bishop of London issued an order prohibiting the printing of any satires whatever and requiring that the published satires of Hall, John Marston, Thomas Nashe, and others be burned.

Repressions of satire

Today the satirist attacks individuals only at the risk of severe financial loss to himself and his publisher. In totalitarian countries he even risks imprisonment or death. Under extreme conditions satire against the reigning order is out of the question. Such was the case in the Soviet Union and most other Communist countries. For example, the poet Osip Mandelstam was sent to a concentration camp and his death for composing a satirical poem on Stalin.

One creative response the satirist makes to social and legal pressures is to try by rhetorical means to approach his target indirectly; that is, a prohibition of direct attack fosters the manoeuvres of indirection that will make the attack palatable: *e.g.*, irony, burlesque, and parody. It is a nice complication that the devices that render satire acceptable to society at the same time sharpen its point. "Abuse is not so dangerous," said Dr. Johnson, "when there is no vehicle of wit or delicacy, no subtle conveyance." The conveyances are born out of prohibition.

Anthony Cooper, 3rd earl of Shaftesbury, writing in the 18th century, recognized the "creative" significance of legal and other repressions on the writing of satire. "The greater the weight [of constraint] is, the bitterer will be the satire. The higher the slavery, the more exquisite the buffoonery." Shaftesbury's insight requires the qualification made above. Under a massively efficient tyranny, satire of the forms, institutions, or personalities of that tyranny is impossible. But, under the more relaxed authoritarianism of an easier going day, remarkable things could be done. Max Radin, a Polish-born American author, noted how satirical journals in Germany before World War I, even in the face of a severe law, vied with each other to see how close they could come to caricatures of the Kaiser without actually producing them. "Satire which the censor understands," said the Austrian satirist Karl Kraus, "deserves to be banned."

The 20th-century American critic Kenneth Burke summed up this paradoxical aspect of satire's relation with the law by suggesting that the most inventive satire is produced when the satirist knowingly takes serious risks and is not sure whether he will be acclaimed or punished. The whole career of Voltaire is an excellent case in point. Bigots and tyrants may have turned pale at his name, as a famous hyperbole has it; however, Voltaire's satire was sharpened and his life rendered painfully complicated as he sought to avoid the penalties of the law and the wrath of those he had angered. Men such as Voltaire and Kraus and the Russian Ye.I. Zamyatin attack evil in high places, pitting their wit and moral authority against cruder forms of power. In this engagement there is frequently something of the heroic.

Readers have an excellent opportunity to examine the satirist's claim to social approval by reason of the literary convention that decrees that he must justify his problematic art. Nearly all satirists write apologies, and nearly all the apologies project an image of the satirist as a plain, honest man, wishing harm to no worthy person but appalled at the evil he sees around him and forced by his conscience to write satire. Pope's claim is the most extravagant:

> Yes, I am proud; I must be proud to see
> Men not afraid of God, afraid of me:
> Safe from the Bar, the Pulpit, and the Throne,
> Yet touch'd and sham'd by *Ridicule* alone.
> O sacred Weapon! left for Truth's defence,
> Sole Dread of Folly, Vice, and Insolence!
>
> (*Epilogue to the Satires*, II, 208–13.)

Relationship between the satirist and his audience

After the great age of satire, which Pope brought to a close, such pretensions would have been wholly anachronistic. Ridicule depends on shared assumptions against which the deviant stands in naked relief. The satirist must have an audience that shares with him commitment to certain intellectual and moral standards that validate his attacks on aberration. The greatest satire has been written in periods when ethical and rational norms were sufficiently powerful to attract widespread assent yet not so powerful as to compel absolute conformity—those periods when the satirist could be of his society and yet apart, could exercise a double vision.

Neoclassic writers had available to them as an implicit metaphor the towering standard of the classical past; for the 19th and 20th centuries no such metaphors have been available. It is odd, however, that, whereas the 19th century in general disliked and distrusted satire (there are of course obvious exceptions), our own age, bereft of unifying symbols, scorning traditional rituals, searching for beliefs, still finds satire a congenial mode in almost any medium. Although much of today's satire is self-serving and trivial, there are notable achievements. Joseph Heller's novel *Catch-22* (1961) once again makes use of farce as the agent of the most probing criticism: Who is sane, the book asks, in a world whose major energies are devoted to blowing itself up? Beneath a surface of hilariously grotesque fantasy, in which characters from Marx brothers' comedy carry out lethal assignments, there is exposed a dehumanized world of hypocrisy, greed, and cant. Heller is a satirist in the great tradition. If he can no longer, like Pope, tell men with confidence what they should be for, he is splendid at showing them what they must be against. The reader laughs at the mad logic of *Catch-22*, and, as he laughs, he learns. This is precisely the way satire has worked from the beginning. (R.C.E.)

Nonfictional prose

Defining nonfictional prose literature is an immensely challenging task. Nonfictional prose literature differs from bald statements of fact, such as those recorded in an old chronicle or inserted in a business letter or in an impersonal message of mere information. As used in a broad sense, the term nonfictional prose literature here designates writing intended to instruct (but not highly scientific and erudite writings in which no aesthetic concern is evinced), to impart wisdom or faith, and especially to please. Separate sections cover biographical literature and literary criticism.

NATURE

Nonfictional prose genres cover an almost infinite variety of themes, and they assume many shapes. In quantitative terms, if such could ever be valid in such nonmeasurable matters, they probably include more than half of all that has been written in countries having a literature of their

own. Nonfictional prose genres have flourished in nearly all countries with advanced literatures. The genres include political and polemical writings, biographical and autobiographical literature, religious writings, and philosophical, and moral or religious writings.

After the Renaissance, from the 16th century onward in Europe, a personal manner of writing grew in importance. The author strove for more or less disguised self-revelation and introspective analysis, often in the form of letters, private diaries, and confessions. Also of increasing importance were aphorisms after the style of the ancient Roman philosophers Seneca and Epictetus, imaginary dialogues, and historical narratives, and later, journalistic articles and extremely diverse essays. From the 19th century, writers in Romance and Slavic languages especially, and to a far lesser extent British and American writers, developed the attitude that a literature is most truly modern when it acquires a marked degree of self-awareness and obstinately reflects on its purpose and technique. Such writers were not content with imaginative creation alone: they also explained their work and defined their method in prefaces, reflections, essays, self-portraits, and critical articles. The 19th-century French poet Charles Baudelaire asserted that no great poet could ever quite resist the temptation to become also a critic: a critic of others and of himself. Indeed, most modern writers, in lands other than the United States, whether they be poets, novelists, or dramatists, have composed more nonfictional prose than poetry, fiction, or drama. In the instances of such monumental figures of 20th-century literature as the poets Ezra Pound, T.S. Eliot, and perhaps William Butler Yeats, or the novelists Thomas Mann and André Gide, that part of their output may well be considered by posterity to be equal in importance to their more imaginative writing.

It is virtually impossible to attempt a unitary characterization of nonfictional prose. The concern that any definition is a limitation, and perhaps an exclusion of the essential, is nowhere more apposite than to this inordinately vast and variegated literature. Ever since the ancient Greek and Roman philosophers devised literary genres, some critics have found it convenient to arrange literary production into kinds or to refer it to modes.

ELEMENTS

Obviously, a realm as boundless and diverse as nonfictional prose literature cannot be characterized as having any unity of intent, of technique, or of style. It can be defined, very loosely, only by what it is not. Many exceptions, in such a mass of writings, can always be brought up to contradict any rule or generalization. No prescriptive treatment is acceptable for the writing of essays, of aphorisms, of literary journalism, of polemical controversy, of travel literature, of memoirs and intimate diaries. No norms are recognized to determine whether a dialogue, a confession, a piece of religious or of scientific writing, is excellent, mediocre, or outright bad, and each author has to be relished, and appraised, chiefly in his own right. "The only technique," the English critic F.R. Leavis wrote in 1957, "is that which compels words to express an intensively personal way of feeling." Intensity is probably useful as a standard; yet it is a variable, and often elusive, quality, possessed by polemicists and by ardent essayists to a greater extent than by others who are equally great. "Loving, and taking the liberties of a lover" was Virginia Woolf's characterization of the 19th-century critic William Hazlitt's style: it instilled passion into his critical essays. But other equally significant English essayists of the same century, such as Charles Lamb or Walter Pater, or the French critic Hippolyte Taine, under an impassive mask, loved too, but differently. Still other nonfictional writers have been detached, seemingly aloof, or, like the 17th-century French epigrammatist La Rochefoucauld, sarcastic. Their intensity is of another sort.

Reality and imagination. Prose that is nonfictional is generally supposed to cling to reality more closely than that which invents stories, or frames imaginary plots. Calling it "realistic," however, would be a gross distortion. Since nonfictional prose does not stress inventiveness of themes and of characters independent of the author's self, it appears in the eyes of some moderns to be inferior to works of imagination. In the middle of the 20th century an immensely high evaluation was placed on the imagination, and the adjective "imaginative" became a grossly abused cliché. Many modern novels and plays, however, were woefully deficient in imaginative force, and the word may have been bandied about so much out of a desire for what was least possessed. Many readers are engrossed by travel books, by descriptions of exotic animal life, by essays on the psychology of other nations, by Rilke's notebooks or by Samuel Pepys's diary far more than by poetry or by novels that fail to impose any suspension of disbelief. There is much truth in Oscar Wilde's remark that "the highest criticism is more creative than creation and the primary aim of the critic is to see the object as in itself it really is not." A good deal of imagination has gone not only into criticism but also into the writing of history, of essays, of travel books, and even of the biographies or the confessions that purport to be true to life as it really happened, as it was really experienced.

Imagination in nonfictional prose

The imagination at work in nonfictional prose, however, would hardly deserve the august name of "primary imagination" reserved by the 19th-century English poet Samuel Taylor Coleridge to creators who come close to possessing semidivine powers. Rather, imagination is displayed in nonfictional prose in the fanciful invention of decorative details, in digressions practiced as an art and assuming a character of pleasant nonchalance, in establishing a familiar contact with the reader through wit and humour. The variety of themes that may be touched upon in that prose is almost infinite. The treatment of issues may be ponderously didactic and still belong within the literary domain. For centuries, in many nations, in Asiatic languages, in medieval Latin, in the writings of the humanists of the Renaissance, and in those of the Enlightenment, a considerable part of literature has been didactic. The concept of art for art's sake is a late and rather artificial development in the history of culture, and it did not reign supreme even in the few countries in which it was expounded in the 19th century. The ease with which digressions may be inserted in that type of prose affords nonfictional literature a freedom denied to writing falling within other genres. The drawback of such a nondescript literature lies in judging it against any standard of perfection, since perfection implies some conformity with implicit rules and the presence, however vague, of standards such as have been formulated for comedy, tragedy, the ode, the short story and even (in this case, more honoured in the breach than the observance) the novel. The compensating grace is that in much nonfictional literature that repudiates or ignores structure the reader is often delighted with an air of ease and of nonchalance and with that rarest of all virtues in the art of writing: naturalness.

Style. The writing of nonfictional prose should not entail the tension, the monotony, and the self-conscious craft of fiction writing. The search for *le mot juste* ("the precise word") so fanatically pursued by admirers of Flaubert and Maupassant is far less important in nonfictional prose than in the novel and the short story. The English author G.K. Chesterton (1874–1936), who was himself more successful in his rambling volumes of reflections and of religious apologetics than in his novels, defined literature as that rare, almost miraculous use of language "by which a man really says what he means." In essays, letters, reporting, and narratives of travels, the author's aim is often not to overpower his readers by giving them the impression that he knows exactly where he is leading them, as a dramatist or a detective-story writer does. Some rambling casualness, apparently irrelevant anecdotes, and suggestions of the conclusions that the author wishes his readers to infer are often more effective than extreme terseness.

The role of eloquence

There is also another manner of writing that is more attentive to the periodic cadences and elegance of prose, in the style of the ancient Roman orator Cicero. The 19th-century English essayist William Hazlitt praised the felicities of style and the refinements of the prose of the British statesman Edmund Burke (1729–97) as "that which went the nearest to the verge of poetry and yet never fell over." A number of English writers have been fond of

that harmonious, and rhetorical prose, the taste for which may well have been fostered not only by the familiarity with Cicero but also by the profound influence of the authorized version of the Bible (1611). Martin Luther's translation of the New Testament (1522) and of the Old Testament (1534) likewise molded much of German prose and German sensibility for centuries.

In the 20th century that type of prose lost favour with American and British readers, who ceased to cherish Latin orators and Biblical prose as their models. In German literature, however, in which harmonious balance and eloquence were more likely to be admired, and in other languages more directly derived from Latin, a musical style, akin to a prolonged poem in prose, was cultivated more assiduously, as exemplified in Italian in the writings of Gabriele D'Annunzio, in French in those by André Gide, and in German in *Die Aufzeichnungen des Malte Laurids Brigge (The Notebooks of Malte Laurids Brigge)* by the poet Rainer Maria Rilke. Such an elaborate style appears to be more easily tolerated by the readers in nonfictional writing, with its lack of cumulative continuity and, generally speaking, its more restricted size, than in novels such as Pater's *Marius the Epicurean* (1885) and occasionally in Thomas Mann's fiction, in which such a style tends to pall on the reader. Similarly, it is easier for the nonfictional prose writer to weave into his style faint suggestions of irony, archaisms, alliterations, and even interventions of the author that might prove catastrophic to credibility in fiction. Critics have argued that too close attention to style was harmful to the sweep necessary to fiction: they have contended that many of the greatest novelists, such as Dickens, Balzac, Dostoyevsky, and Zola at times "wrote" badly; assuredly, they treated language carelessly more than once. Essayists, historians, orators, and divines often affect a happy-go-lucky ease so as to put them on the same footing with the common reader, but they realize that language and style are vital. They must know what resources they can draw from vivid sensations, brilliant similes, balanced sentences, or sudden, epigrammatic, effects of surprise.

Author presence. The one feature common to most authors of nonfictional prose (a few staid historians and even fewer philosophers excepted) is the marked degree of the author's presence in all they write. That is to be expected in epistolary literature, and, although less inevitably, in the essay, the travel book, journalistic reporting, and polemical or hortatory prose. Although the 17th-century French religious philosopher Pascal hinted that "the ego is hateful," the author's presence is still strongly felt. This presence endows their works with a personal and haunting force that challenges, converts, or repels, but hardly ever leaves the reader indifferent. Saint Paul's epistles owe their impact—perhaps second to none in the history of the Western World—to the self that vehemently expresses itself in them, showing no concern whatever for the niceties of Attic prose. In the treatises, discourses, and philosophical argumentation of the great writers of the Enlightenment, such as Voltaire, Diderot, and Rousseau, they frequently resort to the first person singular, which results in a vivid concreteness in the treatment of ideas. To think the abstract concretely, a precept reminiscent of the 18th-century philosophers, was also the aim of the 20th-century philosophers Jean-Paul Sartre and Maurice Merleau-Ponty when they naturalized Existentialist thought in France. The growth of personal literature in its myriad shapes is one of the striking features of modern literary evolution.

The very fact that the writer of nonfictional prose does not seek an imaginary projection to impart his vision, his anguish, and his delights to readers also underlines the nature of his intention. A school of critics has vigorously attacked "the intentional fallacy," which leads biographers and some literary historians to ask what an artist intended before evaluating the completed work of art. But in a work of apologetics or of homiletics, in a work of history or of sociology, in a critical or even in a desultory and discursive essay, and certainly in aphorisms or maxims or both, the intention of the author remains omnipresent. This intention may be disguised under the mask of a parable, under the interlocutors of a philosophical dialogue, or under the admonitions of a prophet, but the reader is never oblivious of the thinker's intent. The reader has a sophisticated enjoyment of one who shares the creator's intent and travels familiarly along with him. He respects and enjoys in those authors the exercise of an intelligence flexible enough to accept even the irrational as such.

APPROACHES

In terms of approach, that is, the attitude of the writer as it can be inferred from the writing, the distinguishing features of nonfictional prose writings are the degree of presence of the ego and of the use of a subjective, familiar tone. Such devices are also used, of course, by authors of fiction, but to a lesser extent. Similarly, the basic modes of writing—the descriptive, the narrative, the expository, and the argumentative—are found in both nonfictional literature and in fiction, but in different degrees.

The descriptive mode. In nonfictional prose, essayists, moralists, naturalists, and others regularly evoked nature scenes. The most sumptuous masters of prose composed landscapes as elaborately as landscape painters. The French writer and statesman Chateaubriand (1768–1848), for example, who was not outstandingly successful in inventing plots or in creating characters independent from his own self, was a master of description: his writings influenced the French Romantic poets, who set the impassive splendour of outward nature in contrast to the inner anguish of mortals. The 19th-century English art critic John Ruskin had a more precise gift of observation, as revealed in his descriptions of Alpine mountains and of the humblest flowers or mosses, but his ornate and sonorous prose was the climax of a high-flown manner of writing that later read like the majestic relic of another era. American nonfictional writers of the same period such as Ralph Waldo Emerson and Henry Thoreau scrupulously described the lessons of organization, of unity, and of moral beauty to be deciphered from the vicissitudes of nature. Russian essayists vied with novelists in their minute yet rapturous descriptions of the thaw releasing the torrents of spring or the implacable force of the long Northern winters. Writers more inclined to the observation of social life, in satirical sketches of the mechanically polite and artificial habitués of salons, helped the novel of social life come into existence in several Western countries.

Narrative. The narrative element is less conspicuous in writing that does not purport to relate a story than in fictional works, but there is a role for narrative in letters, diaries, autobiographies, and historical writing. Most often, an incident is graphically related by a witness, as in letters or memoirs; an anecdote may serve to illustrate a moral advice in an essay; or an entertaining encounter may be inserted into an essay or a travel sketch. Digression here represents the utmost in art; it provides a relief from the persistent attention required when the author is pursuing his purpose more seriously. Similarly, such writing provides a pleasant contrast to the rigid structure of the majority of novels since the late 19th century. In historical writing, however, simplicity and clarity of narrative are required, though it may be interspersed with speeches, with portraits, or with moral and polemical allusions. In other forms of nonfictional prose, the meandering fancy of the author may well produce an impression of freedom and of truth to life unattainable by the more carefully wrought novel. Many writers have confessed to feeling relieved when they ceased to create novels and shifted to impromptu sketches or desultory essays. The surrealist essayists of the 20th century poured their scorn on detective fiction as the most fiercely logical form of writing. In contrast, the author of essays or other nonfictional prose may blend dreams and facts, ventures into the illogical, and delightful eccentricities.

Expository and argumentative modes. The rules of old-fashioned rhetoric apply better to expository and argumentative prose than to the other modes. These rules were first set down in ancient Greece by teachers who elicited them from the smooth eloquence of Socrates, the impassioned and balanced reasoning of Demosthenes, and others. The ancient Romans went further still in codifying

figures of speech, stylistic devices, and even the gestures of the orator. Such treatises played a significant part in the education of the Renaissance Humanists, of the classical and Augustan prose writers of 17th-century England and France, of the leaders of the French Revolution in the 18th century, and even in 19th-century historians and statesmen such as Guizot in France and Macaulay and Gladstone in Britain. But the sophisticated oratory of such 18th-century British orators as Richard Brinsley Sheridan, Edmund Burke, and Charles Fox or, more recently, that of Winston Churchill, hardly seems attuned to audiences in the age of television.

It has been suggested by students of German history that Adolf Hitler, in his vituperative speeches at Nuremberg in the 1930s, fascinated the Germans because they had been unaccustomed, unlike other Western nations, to eloquence in their leaders. If a large part of a population is illiterate, such as the Cubans under Fidel Castro, unending flows of eloquence may constitute a convenient means of educating the masses. Elsewhere, a more familiar and casual type of address from political leaders tends to be preferred in an era of mass media. The gift of a superior orator has been facetiously defined as that of saying as little as possible in as many words as possible. Like sermons, many types of formal address such as lectures, political speeches, and legal pleadings appear to be doomed as documents of literary value, as Burke's or Lincoln's orations and addresses were when they were learned by heart by the younger generations and helped mold the style and contribute to the moral education of men.

THE ESSAY

In modern literatures, the category of nonfictional prose that probably ranks as the most important both in the quantity and in the quality of its practitioners is the essay.

Modern origins. Before the word itself was coined in the 16th century by Montaigne and Bacon, what came to be called an essay was called a treatise, and its attempt to treat a serious theme with consistency deprived it of the seductive charm relished in the later examples of that form of literature. In this sense, the word "essay" would hardly fit the didactic tone of Aristotle's *Rhetoric* or his *Metaphysics*. There were, however, ancient masters of an early form of the essay, such as Cicero discoursing on the pleasantness of old age or on the art of "divination"; Seneca, on anger or clemency; and Plutarch, more superficially and casually, on the passing of oracles. The relentless desire to analyze one's own contradictions, especially among Christians, who, like Saint Paul, were aware of their duality and of "doing the evil which they would not," also contributed to the emergence of the essay. But Christian writing tended to be highly didactic, as may be seen in the work of Saint Augustine of the 5th century, or of the 12th-century theologian Abélard, or even in the Latin writings on "the solitary life" or on "the scorn of the world" by the 14th-century Italian poet Petrarch. Not until the Renaissance, with its increasing assertion of the self, was the flexible and deliberately nonchalant and versatile form of the essay perfected by Montaigne.

Montaigne's pre-eminence as an essayist

Montaigne, who established the term essay, left his mark on almost every essayist who came after him in continental Europe, and perhaps even more in English-speaking countries. Emerson made him one of his six *Representative Men* along with others of the stature of Plato, Shakespeare, and Goethe. Hazlitt lauded Montaigne's qualities as precisely those that "we consider in great measure English," and another English romantic writer, Leigh Hunt, saw him as "the first man who had the courage to say as an author what he felt as a man." And the 20th-century poet T.S. Eliot declared him to be the most important writer to study for an insight into the literature of France. With Montaigne, the essay achieved for the first time what it can achieve better than any other form of writing, except perhaps the epistolary one: a means of self-discovery. It gave the writer a way of reaching the secret springs of his behaviour, of seizing the man and the author at once in his contradictions, in his profound disunity, and in his mobility. The essay was symbolic of man's new attitude toward himself, revelling in change, and hence in growth, and forsaking his age-old dream of achieving an underlying steadfastness that might make him invulnerable and similar to the gods. Now he set out to accept himself whole, with his body and his physical and behavioural pecularities, and thereby repudiate medieval asceticism. He would portray his foibles and unworthiness, hoping to rise above his own mediocrity, or, at the other extreme, he would exalt himself in the hope that he might become the man he depicted. Montaigne in his essays pursued an ethical purpose, but with no pompousness or rhetoric. He offered an ideal that was adopted by his successors for 200 years: perfecting man as a tolerant, undogmatic, urbane social being. But, unlike medieval Christian writers, he would not sacrifice to others the most dearly cherished part of himself. To others he would lend himself, but his personality and his freedom were his own, and his primary duty was to become a wiser human being.

No essayist after Montaigne touched on so many varied aspects of life with such an informal, felicitous, and brilliant style. The later writers who most nearly recall the charm of Montaigne include, in England, Robert Burton, though his whimsicality is more erudite, Sir Thomas Browne, and Laurence Sterne, and in France, with more self-consciousness and pose, André Gide and Jean Cocteau.

Uses of the essay. In the age that followed Montaigne's, at the beginning of the 17th century, social manners, the cultivation of politeness, and the training of an accomplished gentleman became the theme of many essayists. This theme was first exploited by the Italian Baldassare Castiglione in his *Il cortegiano* (1528; *The Courtier*). The influence of the essay and of genres allied to it, such as maxims, portraits, and sketches, proved second to none in molding the behaviour of the cultured classes, first in Italy, then in France, and, through French influence, in most of Europe in the 17th century. Among those who pursued this theme was the 17th-century Spanish Jesuit Baltasar Gracián in his essays on the art of worldly wisdom.

With the advent of a keener political awareness with the age of Enlightenment, in the 18th century, the essay became all-important as the vehicle for a criticism of society and of religion. Because of its flexibility, its brevity, and its potential both for ambiguity and for allusions to current events and conditions, it was an ideal tool for philosophical reformers. *The Federalist Papers* in America and the tracts of the French Revolutionaries, are among the countless examples of attempts during this period to improve the condition of man through the essay.

The advantage of this form of writing was that it was not required to conform to any unity of tone or to similar strictures assigned to other genres since it was for a long time not even considered a genre. After ponderous apologies for traditional faith failed to repulse the onslaught of deism and atheism, traditionalists of the 18th and 19th centuries, such as Burke and Coleridge, abandoned unwieldy dogmatic demonstrations in favour of the short, provocative essay. In the defense of the past, it served as the most potent means of educating the masses. French Catholics, German pietists, and a number of individual English and American authors confided to the essay their dismay at what they saw as modern vulgarity and a breakdown of the coherence of the Western tradition. Essays such as Paul Elmer More's long series of *Shelburne Essays* (published between 1904 and 1935), T.S. Eliot's *After Strange Gods* (1934) and *Notes Towards the Definition of Culture* (1948), and others that attempted to reinterpret and redefine culture, established the genre as the most fitting to express the genteel tradition at odds with the democracy of the new world.

Journalistic essays

The proliferation of magazines in the United States, and the public's impatience with painstaking demonstrations and polemics, helped establish the essay just as firmly as a receptacle for robust, humorous common sense, unpretentiously expressed, as in the writings of Oliver Wendell Holmes (1809–94). Creative writers resorted to it to admonish their compatriots when they seemed too selfishly unconcerned by the tragedies of the world. Archibald MacLeish, for instance, did so in *A Time to Speak* (1941). Lewis Mumford, Allen Tate, and other literary and social critics became crusaders for moral and spiritual reform;

others seized upon the essay for scathingly ironical and destructive criticism of their culture: for example, James Gibbons Huneker (1860–1921), an admirer of iconoclasts and of egoists, as he called them, proposed European examples to Americans he deemed to be too complacent and lethargic; and, more vociferously still, H.L. Mencken (1880–1956), a self-appointed foe of prejudices, substituted his own for those he trounced in his contemporaries.

In other new countries, or in cultures acquiring an awareness of their own ambitious identity, the essay became semipolitical, earnestly nationalistic, and often polemical, playful, or bitter. Such essays sometimes succeeded in shaking the elite out of its passivity. In Uruguay, for example, José Enrique Rodó (1872–1917), in an analogy to the characters in Shakespeare's *Tempest,* compared what should be the authentic South American to the spirit Ariel, in a work thus entitled, in contrast to the bestial Caliban, representing the materialism of North America. In Canada Olivar Asselin (1874–1937) used the essay to advocate the development of a genuine French-Canadian literature. Among the older cultures of Europe, Salvatore Quasimodo (1901–68), the Italian poet and Nobel laureate, appended critical and hortatory essays to some of his volumes of verse, such as *Il falso e vero verde* (1956; "The False and True Green"). Other European heirs to this tradition of the essay include Stefan Zweig and Hugo von Hofmannsthal in Austria and Thomas Mann and Bertolt Brecht in Germany; their sprightly and incisive essays on the arts can be traced to the 19th century German philosopher Arthur Schopenhauer.

Essays for entertainment

One of the functions of literature is to please and to entertain; and the essay, as it grew into the biggest literary domain of all, did not lose the art of providing escape. Essayists have written with grace on children, on women, on love, on sports, as in Robert Louis Stevenson's collection *Virginibus Puerisque* (1881), or Willa Cather's pleasant reflections in *Not Under Forty* (1936). Ernest Renan (1823–92), one of the most accomplished French masters of the essay, found relief from his philosophical and historical studies in his half-ironical considerations on love, and Anatole France (1844–1924), his disciple, and hosts of others have alternated playful essays with others of high seriousness. Sports, games, and other forms of relaxation have not been so often or so felicitously treated. Izaak Walton's *The Compleat Angler* (1953), however, enjoys the status of a minor classic, and the best of the modern Dutch essayists, Johan Huizinga (1872–1945), has reflected with acuteness on *Homo ludens,* or man at play. A Frenchman, Jean Prévost (1901–44), who was to die as a hero of the Resistance to the German occupation of France during World War II, opened his career as an essayist with precise and arresting analyses of the *Plaisirs des sports* (1925). But there are surprisingly few very significant works, except in chapters of novels or in short stories, on the joys of hunting, bullfighting, swimming, or even, since Anthelme Brillat-Savarin's overpraised essay, *Physiologie du goût* (1825; "The Physiology of Taste") on gourmet enjoyment of the table.

Serious speculations, on the other hand, have tended to overburden the modern essay, especially in German and in French, and to weigh it with philosophy almost as pedantic as that of academic treatises, though not as rigorous. The several volumes of Jean-Paul Sartre's *Situations,* published from 1947 on, constitute the most weighty and, in the first two volumes in particular, the most original body of essay writing of the middle of the 20th century. Albert Camus' *Mythe de Sisyphe* (1942; *Myth of Sisyphus*) and his subsequent *Homme révolté* (1951; *The Rebel*) consist of grave, but inconsistent and often unconvincing, essays loosely linked together. Émile Chartier (1868–1951), under the pseudonym Alain, exercised a lasting influence over the young through the disjointed, urbane, and occasionally provoking reflections scattered through volume after volume of his essays, entitled *Propos.*

Political essays

Apart from philosophical speculation, which most readers prefer in limited quantities, the favourite theme of many modern essays has been speculation on the character of nations. It is indeed difficult to generalize on the national temper of a nation or on the characteristics of a given culture. The authors who have done it—Emerson in his essay on *English Traits* (1856), Hippolyte Taine in his studies of the English people, Alexis de Tocqueville in his *Democracy in America* (1835, 1840)—blended undeniable conclusions with controversial assertions. Rather than systematic studies, desultory essays that weave anecdotes, intuitions, and personal remarks, ever open to challenge, have proved more effective in attempting to delineate cultures. In the 20th century, the masters of this form of writing have been among the most able in the art of essay writing: Salvador de Madariaga in Spanish, Hermann Keyserling in German, and Elie Faure in French. Some nations are much more prone than others to self-scrutiny. Several of the finest Spanish essayists were vexed by questions of what it meant to be a Spaniard, especially after the end of the 19th century when Spain was compelled to put an end to its empire. Angel Ganivet in his essay on *Idearium español* (1897; *Spain: An Interpretation*), Ortega y Gasset in *España invertebrada* (1922; *Invertebrate Spain*), and Miguel de Unamuno in almost every one of his prose essays dealt with this subject. A Spanish-born essayist, George Santayana (1863–1952), was one of the most accomplished masters of written English prose; because of his cosmopolitan culture and the subtlety of his insights, he was one of the most percipient analysts of the English and of the American character.

Laments on the decline of the essay in the 20th century have been numerous since the 1940s, when articles in most journals tended to become shorter and to strive for more immediate effect. As a result, the general reader grew accustomed to being attacked rather than seduced. Still, the 20th century could boast of the critical essays of Virginia Woolf in England, of Edmund Wilson in America, and of Albert Thibaudet and Charles du Bos in France, all of whom maintained the high standards of excellence set by their predecessors of the previous century. It is regrettable that, in the language in which the best modern essays have been written, English, the term "essay" should also have acquired the connotation of a schoolboy's attempts at elementary composition. For the essay requires vast and varied information, yet without pedantry or excessive specialization. It must give the impression of having been composed spontaneously, with relish and zest. It should communicate an experience or depict a personality with an air of dilettantism, and of love of composition, and it should make accessible to the reader knowledge and reflection and the delight of watching a fine mind at work. The essayist should possess the virtues that one of the most influential English essayists, Matthew Arnold, praised in *Culture and Anarchy* (1869): "a passion . . . to divest knowledge of all that was harsh, uncouth, difficult, abstract, professional, exclusive; to humanize it."

HISTORY

Among the ancient Greeks and Romans, history was the branch of literature in which the most expert and the most enduring prose was written. It only recovered its supreme rank in nonfictional prose in the 18th century. Earlier, however, at the beginning of the 16th century, in Florence, Italy, Niccolò Machiavelli and Francesco Guicciardini prepared the way for history to become great literature by marrying it to the nascent science of politics and by enlarging its scope to include elements of the philosophy of history. In the 18th century Voltaire, tersely and corrosively, and Edward Gibbon, with more dignity, established history again as one of the great literary arts. In the 19th century, their lessons were taken to heart, as writers and readers realized that, in Thomas Carlyle's words, "every nation's true Bible is its history." In some nations, historians, together with epic and political poets, instilled into the people a will to recover the national consciousness that had been stifled or obliterated. Macaulay's ambition, to see history replace the latest novel on a lady's dressing table, was endorsed as an eminently reasonable and beneficent ambition by scholars throughout the 19th century. After an eclipse during the first half of the 20th century, when erudition and distrust of elaborate style prevailed, the poetry of history has again been praised by the most scrupulous practitioners of that discipline.

Poetry, in that context, does not mean fiction or unfaithfulness to facts, or a mere prettification, which would be tantamount to falsification; rather, it is the recognition that, as G.M. Trevelyan, Regius professor at Cambridge University, proclaimed "The appeal of history to us all is in the last analysis poetic." Few historians today would wholly agree with the once sacrosanct formula of Leopold von Ranke (1795–1886) that their task is to record the past as it really took place. They well know that, for modern history, facts are so plentiful and so very diverse that they are only meaningful insofar as the historian selects from them, places them in a certain order, and interprets them. Since World War II, as history drew increasingly on sociology, anthropology, political and philosophical speculation, and psychoanalysis, the conviction that objectivity could be maintained by a scholar dealing with the past came to be questioned and in large measure renounced. The Italian philosopher Benedetto Croce's laconic warning that all history is contemporary history (*i.e.*, bound to the historian's time and place, hence likely to be replaced by another one after a generation) has come to be generally accepted. Nietzsche, who had sharply questioned the historical methods of his German countrymen in the 1870s, stressed the need to relate history to the present and to present it in a living and beautiful form, if it is to serve the forces of life. "You can only explain the past," he said, "by what is highest in the present."

Interpretive history

In Germany, Italy, Spain, England, America, and most of all in France, where the vogue of sheer, and often indigestible, erudition was never wholeheartedly adopted, more literary talent may have gone into historical writing than into the novel or the short story. Many reasons account for the brilliance, and the impact, of this branch of nonfictional prose. Modern man has a powerful interest in origins—of civilization, of Christianity, of the world initiated by the Renaissance, or the French Revolution, or the rise of the masses. History invites an explanation of what is in terms of its genesis, not statically but in the process of becoming. The breadth of men's curiosity has expanded significantly since the 18th century, when belief in the absolutes of religious faith tended to be supplanted by greater concern for the relative world in which men live, move, and exist. A primary factor in the increasing importance of history is the bewilderment concerning the revolutions that occurred in or threatened so many countries in the latter part of the 20th century. As fiction, philosophy, and the exact sciences failed to provide a plausible explanation, many anguished readers turned to the record of brutal change in earlier periods. The historians who addressed themselves to those immense subjects, with their myriad ramifications, often composed monumental works of a synthetical character, such as those of Arnold Toynbee or Henri Pirenne, but they also cultivated the essay. Sometimes these essays appeared as short and pregnant volumes of reflections, such as Isaiah Berlin's *Historical Inevitability* (1954), sometimes in collections of articles that first appeared in magazines.

DOCTRINAL, PHILOSOPHICAL, AND RELIGIOUS PROSE

The question of how much of doctrinal writing, dealing with faith, ethics, and philosophy, can be called literature can only be answered subjectively by each reader, judging each case on its own merits. There have been philosophers who felt in no way flattered to be included among what they considered unthinking men of letters. The prejudice lingers in some quarters that profundity and clarity are mutually exclusive and that philosophy and social sciences therefore are beyond the reach of the layman. On the other hand, many writers, while often profound and fastidiously rigorous in their thought, such as Paul Valéry, have vehemently objected to being called philosophers. Nonetheless, a vast number of philosophical works owe their influence and perhaps their greatness to their literary merits.

In periods when philosophical speculation became very abstruse, as in Germany in the 19th century, men of letters often acted as intermediaries between the highly esoteric thinkers and the public. Much of the impact of the erudite 19th-century German philosopher Georg Wilhelm Friederich Hegel was due to the more easily approachable writings of those who took issue with him, such as the Existentialist thinker Søren Kierkegaard, or to those who reinterpreted him, such as Karl Marx. Similarly, the thoughts of 20th-century German phenomenologist Edmund Husserl achieved wider circulation by receiving more literary expression in the writings of Jean-Paul Sartre. In modern Europe, the men of letters of Germany were long the most deeply imbued with abstract philosophy. After World War II, however, French writers appeared to take on a zest for abstract speculation, for turgid prose, and for the coining of abstruse terms. Much of French literature in the years after the war has been characterized as "literature as philosophy."

A very few philosophers have reached greatness by evolving a coherent, comprehensive system, ambitiously claiming to account for the world and man. Such harmonious constructions by the greatest philosophers, such as Descartes and Spinoza, might be compared to epic poems in sometimes embracing more than there actually appears to be between heaven and earth. These philosophical systems were conceived by powerful imaginative thinkers whose creative abilities were not primarily of an aesthetic order. The ability and the ambition to produce such systems has appeared in very few countries or cultures. The Slavic, the Spanish, and Spanish-American cultures have been richer in thinkers than in philosophers; that is, in men who reflected on the problems of their own country, who attempted to evolve a philosophy from history, or who applied a broad view to moral or political questions, rather than in men who constructed abstract philosophical systems.

More and more in the 20th century, the sciences that are called in some countries "social" and in others "humane" have replaced the all-encompassing philosophical systems of past ages. In Spain, Miguel de Unamuno (1864–1936) and José Ortega y Gasset (1883–1955) marked the thought and the sensibility of Spanish-speaking peoples far more than systematic philosophers might have done. Their writing, which disdains impeccable logic, is no less thought-provoking for being instinct with passion and with arresting literary effects.

Russian philosophical essays

In Russia, the doctrinal writers whose thought was most influential and often most profound were also those whose prose was most brilliant. They generally centred their speculations on two Russian preoccupations: the revival of Christian thought and charity in the Orthodox faith; and the relationship of Russia to Western Europe, branded by the Slavophiles as alien and degenerate. The consistency of ancient Greek and later Western thinkers, from Aristotle through Descartes, was of scant concern to them, but in the vitality of their style, some of these Russian theorists were masters, whose turbulent, paradoxical ideas were taken to heart by novelists, poets, and statesmen. Among these masters, Aleksandr Herzen (1812–70) combined romantic ardour and positivism, formulating a passionately Russian type of socialism; he left his mark in autobiography, political letters, fiction, and chiefly philosophy of history in *From the Other Shore* (1851). Nikolay Danilevsky (1822–85), a scientist who turned to philosophy, attempted to convince his compatriots that the manifest destiny of their country was to offer a purer and fresher ideology in lieu of that of the decadent West. V.V. Rozanov (1856–1919) was an apocalyptic prophet preaching an unusual interpretation of Christian religion; a number of his intuitions and passionate assertions are found in the novel *The Possessed* (1871–72), by Fyodor Dostoyevsky, whose own nonfictional prose is of considerable quality and conviction. The strangest and most contradictory, but also the most brilliant prose writer, among those thinkers who were torn between East and West, between a jealous Orthodox faith and the attraction of Catholic Rome, was Vladimir Solovyov (1853–1900). He blended the most personal type of visionary mysticism with an incisive humour in a manner reminiscent of Kierkegaard. His philosophical essay-dialogue-treatise, *Three Conversations on War, Progress and the End of Human History* (1900), is representative of the nonfictional Russian prose that, while not widely known outside Russia, is as revealing as the Russian novel

of the permanent contradictions and aspirations of the Slavic character.

The role of nonfictional prose in the American literature of ideas is significant, as can be seen in several of Emerson's philosophical essays and addresses; in Walt Whitman's *Democratic Vistas* (1871); in William James's pleasantly written essays on religious experience and on sundry psychological and ethical topics; in George Santayana's dexterous and seductive developments on beauty, on nature, on poets, on the genteel tradition, all envisaged with ironical sympathy. Irving Babbitt (1865–1933), Thorstein Veblen (1857–1929), and Lewis Mumford are among the many American writers who, in the 20th century, maintained the tradition of writing on abstract or moral themes with clarity and elegant simplicity. Earlier, Thomas Jefferson and Benjamin Franklin had expressed their lay philosophy in a manner they wished to be widely accessible.

In France the tradition *haute vulgarisation*—"higher vulgarization" or popularization—never died and was seldom slighted by the specialists. There, and to a slightly lesser extent in Britain, much of the most valuable writing in prose was an elucidation of the view of life underlying the creations of eminent men in many fields. Such doctrinal writing, expounding innermost convictions and sometimes representing a diversion from more intensive pursuits, constitutes a by no means negligible portion of the writings of the philosopher Bertrand Russell, of the poet William Butler Yeats, and others. The novelist or the poet may well use nonfictional prose to purge his own anger, to give vent to his vituperation against his confrères, and to relieve his imagination of all the ideological burden that might otherwise encumber it. D.H. Lawrence preserved the purity of his storyteller's art by expressing elsewhere his animadversions against Thomas Hardy or Sigmund Freud. Albert Camus stripped his fiction and short stories of the ideological musings found in his philosophical volumes. Marcel Proust succeeded in incorporating many abstract discussions of the value of art, love, and friendship in his very original and loose type of fiction; but his great work, *À la recherche du temps perdu* might well have gained even more from the excision of those dissertations and the writing of more volumes like his *Chroniques* (1927) or *Contre Sainte-Beuve* (1954). The masters of nonfictional prose in French in the 20th century have been those thinkers who were also superb stylists and who deemed it a function of philosophy to understand the aesthetic phenomenon: Henri Bergson (1859–1941), Paul Valéry (1871–1945), and Gaston Bachelard (1884–1962). No more poetical advocate of reverie has arisen in the 20th century than *La Poétique de la rêverie* (1960; *The Poetics of Reverie*) and the posthumous collection of essays, *Le Droit de rêver* (1970; "*The Right to Dream*"), by Bachelard, who was also a philosopher of science. A major influence on him, as on several earlier poets endowed with profound intellect, such as Baudelaire and Valéry, was Edgar Allan Poe, the impact of whose essays on poetics, on cosmology, and on dreams and reveries has been immense and beneficent. More than a century after his death, many of Poe's American compatriots have conceded that the storyteller and the poet in Poe counted for less, as his European admirers had divined, than the writer of critical and doctrinal prose rich in dazzling intuitions.

Religious literature

Although lectures, articles, and other prosaic admonitions have tended to take their place, sermons, funeral orations, allegories, and the visions of eternal punishment brandished by theologians constitute some of the most unforgettable prose. This form of nonfictional prose literature dates from before the Christian Era; Jewish thought and style were molded by commentaries on the Old Testament and compilations of the wisdom of the sages. Later, and more nearly literary, works of this nature include Sebastian Brant's didactic, poetical, and satirical *Narrenschiff* (1494; *Ship of Fools*), and the mystic writings of Jakob Böhme (1575–1624) in Germany, the moving sermons of Jón Vídalín (1666–1720) in Iceland. In England, Richard Baxter (1615–91) and John Bunyan (1628–88) were among the most eloquent of the 17th-century Puritans who composed doctrinal works of literary merit; along with the epic poet John Milton (1608–74), whose prose works hardly count for less than his poetry, they exercised a powerful influence on the English language through their doctrinal prose. Their contemporary, the Anglican Jeremy Taylor (1613–67), wrote the most sustained and dignified prose of an age that, on the continent, would be called Baroque. A little later, in northern Europe, the Norwegian Ludvig Holberg (1684–1754), who spent most of his life in Denmark and became best known as a comic writer, also advised his contemporaries how to live morally in his *Ethical Thoughts* and other didactic treatises. The Swede Emanuel Swedenborg (1688–1772), less gifted as a writer but far more original in his blend of mysticism and science, outshone all previous Scandinavians in impressing the imagination of other Europeans. No less influential, Søren Kierkegaard (1813–55), because of his stimulating ambiguities, his bold treatment of traditional theology and philosophy, and his extraordinary ability to write vivid, biting, and provoking prose, was, a century after his death, one of the most potent forces in the literature and thought of Western civilization.

Many 20th-century readers experience a feeling of remoteness in this kind of doctrinal writing, which stems in part from a lack of vital interest in the beliefs it embodies and from a coolness toward religious dogmatism or fanaticism. Intolerance has shifted from religion to the domain of politics. But the contemporary estrangement from that rich literary heritage is due also to a distrust of high-flown eloquence. Cotton Mather's *Essays to do good* (1710) has few readers in present-day New England, despite that region's Puritan tradition, and Jonathan Edwards (1703–58), a writer of great spiritual warmth and imaginative style who was the first of the great prose writers of America, is admired today chiefly by specialists.

A less sonorous style, one that does not ring so monotonously ornate to the reader's ears, is now preferred. In Spain, Antonio de Guevara (*c.* 1480–1545), a preacher who was at his best in his familiar and satirical moments, and St. Teresa of Avila (1515–82), in her records of her mystical ecstasies, have withstood the changing tides of taste. The French also succeeded in maintaining their appreciation of their two greatest religious writers, Pascal and Bossuet, at the very top of the nonfictional prose writers; both are still revered and occasionally imitated. Pascal took over traditional theology and treated it as literature; his unfinished *Pensées* have exercised far more influence than the rationalism of the greatest French philosophers on the sensibilities of the French. Bossuet's orations reveal the magnificent but refrigerating decorum that seems inseparable from eulogies of the dead—a genre that precludes full sincerity and cultivates tremulous emotion to a dangerous degree. Bossuet's sermons and treatises, however, include masterpieces of simple, terse, direct oratory, which show him as the majestic defender of the unity of faith, of absolutism, and of tradition. His was the last significant endeavour in the 17th century to arrest the flow of relativism and of rebellious individualism, which had engulfed Western civilization with the Renaissance, the Reformation, and Humanism. The two most brilliant writers of religious prose in France in the 20th century were Pierre Teilhard de Chardin (1881–1955), a poetical writer with a luxury of images, and Simone Weil (1909–43), more terse and restrained; they steered a middle course between dogmatism and humility in luring the lay reader to their ardent expressions of conviction.

POLITICAL, POLEMICAL, AND SCIENTIFIC PROSE

In the 20th century, political, economic, and social thought has attempted to reach scientific precision through the use of quantitative data, processing machines, and mathematical formulas. Through such means, other disciplines eventually were elevated to the status of sciences. Literature lost a great deal as a result of this scientific urge, and political and economic thought may have lost even more; for example, the ability to be understood, and perhaps applied, by men of affairs and leaders of nations. The result has been that momentous decisions may be made independent of political theory, which is more often called upon to explain them afterward. Albert Einstein

remarked that politics is much more baffling and difficult than physics and that consequences of errors in politics are likely to make far more difference to the world than the miscalculations of science. Politics is often defined as the art of the possible; it is also an art of improvisation, since the fleeting occasions must be grasped when they appear, and risks must be taken without a full array of scientific data. Like military action, however, political action can be studied in historical writings and in the literary testimonials of men who ran the affairs of their country. Thucydides, Cicero, Caesar, Milton, Burke, Napoleon, and Jefferson were such men of action who were also endowed with uncommon literary gifts. In varying degrees, Benjamin Disraeli, Winston Churchill, Woodrow Wilson, Clemenceau, Lenin, and de Gaulle owed some of their insight and effectiveness to their literary efforts.

Authors, however, are by no means infallible in dealing with the unpredictable course of political life. Interpreting and channelling public opinion proved insuperably difficult, for example, to Alphonse de Lamartine in the revolutionary period of 1848–49 in France, to the bookish Aleksandr Kerensky during the 1917 Revolution in Russia, and to a number of brilliant writers who attempted to guide the Spanish Republic in the 1930s. Crowds often can be moved more readily by vapid, repetitious, or inflammatory speeches than by profound or wise counsel. Abraham Lincoln's Gettysburg Address, Churchill's speeches during Britain's "finest hour" early in World War II, and de Gaulle's lofty eloquence regarding the crises of three decades in France were admired less when they were delivered than afterward. As they are collected, studied, and engraved in the mental makeup of millions of future citizens, such speeches have an effectiveness second to no other form of nonfictional prose. Novels may exercise immense influence through the acute social criticism they embody, but their impact upon the sensibility and the behaviour of their readers is probably less than that of political prose.

Spanish political essays

Although the Spanish language cannot boast of any political thinker comparable to Plato, Machiavelli, or Rousseau, it may boast a large number of fine writers on political topics. Generally, these writers reveal a restrained and terse style, like the poets of Spain, the Latin country least addicted to inflation of language. Garcilaso de la Vega (1539–1616), the son of an Inca mother, wrote with courage and talent of the Peruvians and other cultures of the New World cruelly wrecked by their Catholic conquerors. The Argentinian Domingo Faustino Sarmiento (1811–88) fought in battle and with his pen against his country's dictator and left a masterpiece of social insight, written with rare effectiveness, *Facundo* (1845). Miguel Ángel Asturias (1899–1974), from Guatemala, scathingly depicted the evils of dictatorship in Central America. Like many others in South America, where versatility is not uncommon, Francisco de Miranda (1750–1816) of Venezuela was both a political writer and a statesman.

Italy, after Machiavelli, failed to produce political writers of very great eminence, even during its liberation and unification in the 19th century. The universal thinker Benedetto Croce (1866–1952), however, had the courage to publish during the Fascist era the most impassioned defense of liberty in volumes such as *La storia come pensiero e come azione* (1938; *History as the Story of Liberty*). Another Italian—but from another political direction—Antonio Gramsci (1891–1937), one of the most intelligent exponents of Communism in western Europe, was aware of the vital significance of literary form to spread political ideas. He bitterly deplored the lack of a popular literature in his country that reflected the morality and sentiment of the people.

In France political speculation was more comprehensive: few political theoricians have proved as influential as the philosophers of the Enlightenment, especially Montesquieu and Rousseau. It was the good fortune of the French that during their Revolution at the end of the 18th century and throughout the 19th century, its keenest political minds were also writers of admirable prose. Tocqueville's observations became a sacred text for many a student of America and of pre-Revolutionary France. Since the French seldom give ideas serious consideration unless they are well expressed, however, it was a misfortune that most political speculation after the Napoleonic age was written by gifted, often brilliant, conservatives, such as Joseph de Maistre, Auguste Comte, Frédéric Le Play, Renan, Taine, and Charles Maurras. Those advocating a socialistic view, such as Jean Jaurès and the more elegant and genteel Léon Blum, failed to express their theories in classic prose. The level of political comment in the magazines and newspapers in France is consistently high, but the writers tend to be either too clear-sighted or too arrogant to grant their statesmen a chance to act. "Fair play" is an untranslatable phrase in French, and politics in France, unlike some other countries, is never regarded as a game or sport. Rather, it is a passionate affair of the heart and intellect, conducted in a mood of intransigence. The English essayist Walter Bagehot (1826–77), observing the French at the time of the 1851 coup d'état, commented wryly that "the most essential quality for a free people, whose liberty is to be progressive, permanent and on a large scale, is much stupidity .... Stupidity is nature's favorite resource for preserving steadiness of conduct and consistency of opinion."

English and American political works, from the 17th century on, excel all others; they constitute the richest form of nonfictional prose in the English language. John Milton's *Areopagitica* (1644) and his other political pamphlets are monuments of political prose that survive to this day as classics. Edmund Burke's *Letter to a Noble Lord* (1796) was praised a century and a half after its composition as the greatest piece of invective in the English language. William Godwin's *Political Justice* (1793) does not compare in the majesty of its prose to those supreme models, but it did inflame Shelley and other men of letters of the time. Walter Bagehot wrote equally well on literature, politics, and economics, and *The Economist,* which he edited, was the best-written weekly of its kind in any language. John Stuart Mill and Thomas Carlyle also helped to maintain the tradition of political and social thought expressed as literature through the 19th century.

The decline of polemics

Polemical prose significantly declined in the modern era. Few moderns express the rage for invective seen in the verse of satirists such as the ancient Roman Juvenal or Alexander Pope in 17th-century England or even in the writings of Christian disputants such as Martin Luther. Voltaire rejoiced in flaying not only his enemies but also some, such as Montesquieu and Rousseau, who were fundamentally in agreement with him in the fight against the religion of his age. Literary polemics of a high order were employed against the cultural imperialism of the French in Gotthold Lessing's *Hamburgische Dramaturgie* (1767–69; *Hamburg Dramaturgy*). Beside these examples, the polemics of more recent periods seem tame, or else gross and venomous. Later practitioners of the literature of insult include Émile Zola, particularly in his celebrated article on the Dreyfus affair, *J' Accuse* (1898). Later writers, however, often overreach themselves; their rhetoric sounds vapid and their epigrams strained.

The rift between the two cultures, scientific and humanistic, is probably not as pronounced or final as it has been alleged to be. About the time the division was enunciated, in the mid-20th century, it was possible to point to a number of eminent scientists who were also masters of prose writing—Henri Poincaré, Jean Rostand, and Gaston Bachelard in France; Bertrand Russell and Alfred North Whitehead in England; and René Dubos and Robert Oppenheimer in the U.S. The peril for scientists who undertake to write for laymen appears to lie in a temptation to resort to florid language and to multiply pretentious metaphors and elaborate cadences in their prose. Some scientists who wrote on astronomy, on anthropology, and on geology have not altogether escaped that pitfall: Sir James Jeans, Loren Eiseley, Sir James Frazer, Teilhard de Chardin. The marriage of the "two cultures" in one mind, which was no less concerned with scientific truth than with beauty of form, was found frequently in older times; Aristotle, Hippocrates, Galileo, Newton, and Goethe all showed strong interest in both. The popularization of science reached a level of a lucid and elegant art with the

writings of Bernard de Fontenelle (1657–1757) in French, Francesco Algarotti (1712–64) in Italian, and later, with a masterpiece of scientific rigour expressed in flexible and precise prose, *Introduction à l'étude de la médecine expérimentale*, by the physiologist Claude Bernard (1813–78).

OTHER FORMS

Reportage. Journalism often takes on a polemical cast in countries in which libel laws are not stringent. Polemical journalism flourished in continental Europe when a journalist's insults could be avenged only in a duel; one of the great journalists of this heroic era of the press in France, Armand Carrel, died in such a duel with another journalist in 1836. Most journalistic literature, however, deserves none of the ill-repute that is associated with its more polemical expressions. Rather, it is a remarkably elastic form, as adaptable to sarcasm and the puncturing of illusions as to reflection, subtle persuation, and infectious geniality. Among the eminent writers who explored its possibilities in the 18th century, Joseph Addison and Richard Steele offered models of polished English prose in the journals *The Tatler* and *The Spectator*, and Jonathan Swift and Oliver Goldsmith also used it effectively in England. In France Voltaire, the novelist Abbé Prévost, and the dramatist Pierre-Carlet de Marivaux all found effective use for the form. By the 19th century, most eminent men of letters attempted to broaden their audiences by means of articles and essays in the press, and in the 20th century, the influence of journalism pervaded the most important works of some authors. Some of the works of G.B. Shaw and H.G. Wells, for example, were reminiscent of journalism in the manner in which they sought topical controversy and challenged social and political prejudices. Many of the finest essays of Virginia Woolf, John Middleton Murry, and Aldous Huxley represented British literary journalism at its most intelligent level. In America, the more heterogeneous public to which authors must address themselves and, later, the competition of the audiovisual media, were not propitious to the flowering of literary journalism of that type. In a more ephemeral genre, that of political reflections couched in clear, pungent style, Walter Lippmann composed models of commentaries on politics and ethics.

Ego in journalistic style

The more self-centred and passionate writers seldom succeeded in journalistic prose as well as those who could forget their ego and adapt their style to a public that wanted to be entertained, moved, or convinced, perhaps, but whose attention span extended no further than the 15 minutes of a train ride or of a hurried breakfast. In France, Proust dreamt for years of appearing as a journalist on the first column of the journal *Le Figaro*. But he and his contemporaries Gide, Claudel, and Valéry, and, later, the imperious and nervous André Malraux, did not conform to the limitations of the newspaper article. On the other hand, Colette, Paul Morand, and François Mauriac proved conspicuously successful in writing the brief, gripping, taut article dear to readers of many of the better continental dailies and weeklies.

The insidious appeal of journalistic writing to thinkers, novelists, and poets is similar to the siren charm of conversation for the author who enjoys talking brilliantly at dinner parties. As Oscar Wilde ruefully remarked, conversationalists and journalists, intent on reporting on the ephemeral, pour whatever genius is theirs into their lives, and only their talent into their works.

Aphorisms and sketches. Authors of maxims and aphorisms, on the contrary, strive for the brevity of inscriptions on medals and public buildings and for a diamond-like resistance to the devastation of time upon diffuse and padded writing. This form is periodically revived. In modern letters, in the latter half of the 20th century, a condensed and enigmatic sort of prose was preferred to poetry by several poets, who invested their sensations, their illuminations, or their reflections with the mystery and éclat of aphorisms. Among the French, who have always favoured the maxim for philosophical, psychological, and ethical advice, a great poet, René Char, came to be more and more fascinated by that epigrammatic form, harking back to the ancient Greek philosopher whom he admired most, Heracleitus. Char found in the aphorism a means of "pulverizing language" and of allowing the isolated words or groups of words, freed from rhetoric and from the exigencies of clarity, to emerge like rocks from a sunken archipelago. Other French prose writers, including Camus, Char's warmest admirer, and Malraux, likewise scattered through their prose works striking aphorisms that summed up the sense of a situation or the experience of a lifetime. French novels, from the 18th century through the 20th, reflect the influence of the unforgettable maxims coined by the 17th-century moralists Pascal, La Rochefoucauld, and La Bruyère. The novelist could never long resist the seduction of brevity, the challenge of condensing wisdom into a neat, usually bitter, formula, which usually suggested to the reader not to expect overmuch from life and to take revenge upon its little ironies by denouncing it in advance.

Maxims and other pointed and epigrammatic phrases of the sort the ancient Romans called *sententiae* can become too sophisticated or can too obviously strive for effect. This form of expression reached its point of perfection, balancing profundity and solidity of content with pointedness of form, with the moralists of the 17th and 18th centuries in France, whom Nietzsche ranked above all other writers. They included Pascal and La Rochefoucauld and, later, Sébastien Chamfort (1740/41–94), a satirical pessimist often quoted by Schopenhauer and Joseph Joubert (1754–1824). This form, even more than poetry, represents the most economical means of communicating long experience and for imparting moral advice. In a very few words, or at most a few lines, an aphorism may enclose enough matter for the plot of a novel. It may trounce the prejudices of snobbery more vigorously than a long, meandering novel of manners. The greatest of the 19th-century poets, Goethe, Novalis, Leopardi, Vigny, and Baudelaire, as well as painters such as Delacroix, Cézanne, Degas, and later Braque, cherished the epigrammatic, incisive form of expression. One of the advantages of the aphorism or *pensée* is that it can easily produce an impression of depth when it may be only a commonplace pungently expressed. Another is that it allows several approaches to a subject by the skilled prose writer. If he is of a fiery temperament, prone to enthusiasms and lashing out in wrath against what he deems to be false, he can, like Nietzsche, embrace contradictions and sponsor opposed attitudes. If Epictetus, Pascal, and Nietzsche had expressed their reflections consistently and systematically, their works would probably be forgotten. Nonetheless, as Pascal shrewdly remarked, the aphoristic prose style is, of all the manners of writing, the one that engraves itself most lastingly in the memories of men.

That form, in verse and in prose, probably constitutes the most widespread form of literature. It is found in many nations that long lived without fiction, epics, or even popular poetry. It is found in ancient sayings that interlard the speeches of the 20th-century leaders both of the U.S.S.R. and of China; in the book of Proverbs of the Bible; in the Qur'ān; in the Afrikaans language of South Africa in the 20th-century writings of J. Langenhoven. Proverbs, maxims, riddles, and even conundrums make up a large part of black African folklore. The animal tales of these people also provide lessons in the form of aphorisms that are neither as platitudinous nor as didactic as Aesop's fables.

Portraits and character sketches

Portraits and sketches are a form of literature that thrives in cultures in which the court, the salon, or the café plays an important role. The few examples left by the ancient Greeks, such as by Theophrastes, pale beside the vivid portraits of real individuals drawn by the ancient Roman historian Tacitus and by the impassioned orator Cicero. In the Classical age of 17th-century France, the character sketch was cultivated in the salons and reached its summit with La Bruyère. That form of writing, however, suffered from an air of artificiality and of virtuosity. It lacked the ebullience and the imagination in suggesting telltale traits that characterize the portraits of the duc de Saint-Simon (1675–1755). Collections of sketches and characters, however, tend to strike the reader as condescending

and ungenerous insofar as the writer exempts himself of the foibles he ridicules in others.

Humorous essays

The humorous article or essay, on the other hand, is a blend of sympathy and gentle pity with irony, a form of criticism that gently mocks not only others but the mocker himself. Humour strikes deep roots in the sensibility of a people, and each nation tends to feel that its own brand of humour is the only authentic one. Its varieties of humorous writing are endless, and few rules can ever be formulated on them. Humorous literature on the highest literary level includes that of Cervantes in Spain, of Sterne, Lamb, and Thackeray in England, of Jean Paul in Germany, and of Rabelais, Montaigne, and Voltaire in France. Romantic authors have, as a rule, been too self-centred and too passionate to acquire the distance from their own selves that is essential to humour. In the 20th century, some of the most original examples of what has been called the "inner-directed smile" are in the works of the Argentine Jorge Luis Borges and by one of the writers he admires most, the English essayist G.K. Chesterton (1874–1936). In both writers, and in other virtuosos of the intellectual fantasy, there is a persistent refusal to regard themselves as being great, though greatness seems to be within their reach. The humorist will not take himself seriously. Chesterton hides the depth of his religious convictions, while Borges facetiously presents his prodigious erudition and indulges in overelaborate and flowery prose. Borges likes to put on and take off masks, to play with labyrinths and mirrors, but always with a smile. By sketching what appear to be fanciful portraits rather than overtly fictional stories, he creates a half-imaginary character whose presence haunts us in all his writings—that of the author himself.

Dialogues. The dialogue form has long been used as a vehicle for the expression of ideas. It is especially cherished by authors eager to eschew the forbidding tone of formality that often accompanies the expression of serious thought. The writer of a dialogue does not directly address his public, but instead revels in the multiple facets of ideas. By playing this dialectical game he can appear to present contrary views as their respective proponents might and then expose the errors of those he opposes, leading the readers to accept his own conclusions. The advantages of the dialogue are clear: ideas that might have remained abstruse and abstract become concrete and alive. They assume dramatic force. A constant element in the dialogue is irony; etymologically, the term derives from a form of interrogation in which the answer is known beforehand by the questioner. The earliest models of the genre, by the ancient Greeks Plato and Lucian, have never been excelled. Sophistry is another element of the dialogue. In Plato and in the dialogues of Pascal's *Provinciales* (1656–57; "Provincial Letters"), the protagonist plays with the naiveté of his opponents, who always end by surrendering. The writer of a dialogue cannot affect the same casual and self-indulgent attitude as the author of a personal essay since the characters and their statements must be plausible. Nor can he pursue an argument consistently, as he might in a critical, historical, or philosophical essay. Something must persist in the dialogue of the spontaneity and the versatility of an actual conversation among witty and thoughtful people.

There was much seriousness and occasionally some pedantry in early dialogues in several literatures. The dialogues of Bardesanes (154–222) in Syriac, rendered into English as *On Fate*, are on the subject of the laws of the country. A hundred years earlier, Lucian, who was also Syrian, proved himself a master of flowing and ironical Greek prose in his satirical dialogues. The Italian Renaissance writer Pietro Aretino (1492–1556) proved himself the equal of Lucian in verve in his *Dialogues* using the same mold and the same title as Lucian. Others who used the dialogue form included Castiglione and Pietro Bembo (1470–1547) in Italy; and in Spain Juan Luis Vives (1492–1540), León Hebreo (1460–*c.* 1521), and Juan de Valdés (*c.* 1500–41), who treated questions of faith and of languages in dialogues. The genre flourished in the 18th century: Lessing, Diderot, and the Irish philosopher George Berkeley. Diderot's works largely consist of sprightly, rambling, and provocative discussions between the various aspects of his own remarkable mentality. Bold conjectures, determined onslaughts on prejudices, insights into physiology and biology, and erotic fantasies all enter into his dialogues. In the 19th century a number of complex literary personalities, who were capable of accepting the most diverse, and even conflicting points of view, such as Renan and Valéry, had a predilection for the dialogue. Among the devices used by authors of dialogue—many of whom lacked the sustained inventiveness required by fiction—was to attribute their words to the illustrious dead. The French prelate Fénelon, for example, composed *Dialogues des morts* (1700–18), and so did many others, including the most felicitous master of that prose form, the English poet Walter Savage Landor, in his *Imaginary Conversations* (1824) and *Pentameron* (1837).

Travel and epistolary literature. The literature of travel has declined in quality in the age when travel has become most common—the present. In this nonfictional prose form, the traveller himself has always counted for more than the places he visited, and in the past, he tended to be an adventurer or a connoisseur of art, of landscapes, or of strange customs who was also, occasionally, a writer of merit. The few travel books by ancient Greek geographers, such as Strabo and Pausanias of the 1st and 2nd centuries AD, are valuable as a storehouse of remarks on ancient people, places, and creeds. Travel writing of some literary significance appears in the late-13th-century writings of Marco Polo. Works of a similar vein appeared in the 17th century in the observations of Persia two French Huguenots, Jean-Baptiste Tavernier and Jean Chardin, whose writings were lauded by Goethe. Many books of documentary value were later written by English gentlemen on their grand tour of the Continent. The 18th-century Italian egotist Casanova and his more reliable and sharper compatriot Giuseppe Baretti (1719–89) also produced significant travel writings.

The form comprises many of the finest writings in prose during the Romantic age. Not only were the Romantics more alive to picturesqueness and quaintness but also they were in love with nature. They were eager to study local colours and climates and to depict them in the settings for their imaginative stories. Also, travel gave the Romantic writer the illusion of flight from his wearied self. The leisurely record of Goethe's journey to Italy in 1786–88 counts more readers than most of his novels. *Pismo russkogu puteshestvennika* (1791–92; Eng. trans., *Letters of a Russian Traveler, 1789–1790,* 1957) by Nikolay Karamzin is one of the earliest documents in the development of Russian Romanticism. Ivan Goncharov (1812–91), the Russian novelist who stubbornly limited his fiction to his own geographical province, recorded in *Frigate Pallas* his experience of a tour around the world. Nowhere else in the whole range of literature is there anything comparable to *Peterburg* (1913–14), by a virtuoso of poetic style, Andrey Bely; it is a travel fantasy within a city that is both real and transfigured into a myth. Neither James Joyce's Dublin nor Balzac's Paris is as vividly recreated as the former Russian capital in Bely's book. Other travel writers of note include the multinational Lafcadio Hearn (1850–1904), who interpreted Japan with sensitivity and insight. Earlier, two other Westerners wrote on Asia, the English historian Alexander W. Kinglake (1809–91), in *Eothen* (1844), and, more incisively, the French diplomat Joseph-Arthur, comte de Gobineau (1816–82); both blended a sense of the picturesqueness of the East with shrewdness in the interpretation of the people. One of the most thoughtful and, in spite of the author's excessive self-assurance, most profound books on Asia is *Das Reisetagebuch eines Philosophen* (1919; *Travel Diary of a Philosopher*), by the German thinker Hermann Keyserling (1880–1946). With an insatiable interest in countries, Keyserling also interpreted the soul of South America and, less perceptively, analyzed the whole spectrum of European nations. Among the thousands of travel books on Italy, there are a few masterpieces of rapturous or humorous prose: in English, the writings of D.H. Lawrence on Sardinia, on Etruscan Italy, and on the Italian character are more lucid and less strained than other of his prose cogitations. Venice, "man's most beautiful artifact," as Bernard Beren-

son called it, inspired Rousseau, Chateaubriand, Maurice Barrès, Anatole France, and hundreds of other Frenchmen to write some of their finest pages of prose. After World War I, there was a distinct yearning for new possibilities of salvation among war-ridden Europeans, dimly descried in Asia, in Russia, or in America, and travel literature assumed a metaphysical and semireligious significance. The mood of the writers who expressed this urge was somewhat Byronic; they were expert at poetizing the flight from their own selves. Blaise Cendrars (1887–1961) in his novel *Emmène-moi au bout du monde* (1956; "Take Me Away to the End of the World"), epitomizes the urge to seek adventures and a rediscovery of oneself through strange travels. The very theme of travel, of the protagonist being but a traveller on this earth, has been, from Homer's *Odyssey* onward, one of the most laden with magical, and symbolical, associations in literature. Countless authors have played moving and delicate variations on it.

The letter as a genre

Of all the branches of nonfictional prose, none is less amenable to critical definition and categorization than letter writing. The instructions of the ancient grammarians, which were repeated a thousand times afterward in manuals purporting to teach how to write a letter, can be reduced to a few very general platitudes: be natural and appear spontaneous but not garrulous and verbose; avoid dryness and declamatory pomp; appear neither unconcerned nor effusive; express emotion without lapsing into sentimentality; avoid pedantry on the one hand and banter and levity on the other. Letters vary too much in content, however, for generalizations to be valid to all types. What is moving in a love letter might sound indiscreet in a letter of friendship; an analysis of the self may fascinate some readers, while others prefer anecdotes and scandal. La Bruyère, at the end of the 17th century, remarked that women succeed better than men in the epistolary form. It has also been claimed that a feminine sensibility can be seen in the letters of the most highly acclaimed male masters of this form, such as Voltaire, Mirabeau, Keats, and Baudelaire. Advice to practitioners of the art of letter writing usually can be expressed in the often-quoted line in Shakespeare's *Hamlet*: "To thine own self be true." The English biographer Lytton Strachey (1880–1932), a copious and versatile letter writer himself, wrote: "No good letter was ever written to convey information, or to please its recipient: it may achieve both those results incidentally; but its fundamental purpose is to express the personality of the writer." There are, however, numerous and even contradictory ways of expressing that personality.

Although critics have issued endless disquisitions on the craft of fiction and other genres, they have generally remained silent on the epistolary genre, though it has sometimes been the form of prose that outlives all others. Ever since the expression of the writer's personality became one of the implicit purposes of writing in the 18th century, the letters of such eminent authors as Diderot, Rousseau, Byron, and Flaubert have probably offered at least as much delight as any of their other writings. Impressive monuments of scholarship have been erected on the presentation of the complete letters of Thackeray, George Eliot, Swinburne, and Henry James. The literatures of France and England are notably richer in letter writing of the highest order than are the literatures of the United States and Germany. Contrary to many pessimistic predictions regarding the effect on letter writing of modern means of communication, such as the telephone, together with an apparently increasing penchant for haste, some of the richest, most revealing, and most thoughtful letters of all times have been written in the 20th century; those of the English writers Katherine Mansfield and D.H. Lawrence are paramount among them.

Personal literature. The cult of the ego (that is, a preoccupation with self-analysis) is a late development in the history of literature. There were, to be sure, men in ancient times who were absorbed in their own selves, but there is almost no autobiographical literature from ancient Greece and, in spite of Cicero and Pliny the Younger, there is little from ancient Rome. The confession, made as humble as possible and often declamatory in the exposition of the convert's repented sins, was an outgrowth of Christianity; masters of confessional literature were Saint Augustine, Petrarch, and the English Puritans. Autobiographical writing took a different form in the 18th century in the work of men who would have agreed with Goethe that personality is the most precious possession. After the publication of Rousseau's *Confessions* in France in 1781, the passion for looking into one's heart (and other organs as well) spread to other literatures of western Europe. Many a novelist thereafter kept a precise record of his cogitations, anxieties, and harrowing moments of inability to create. Poets and painters, including Delacroix, Constable, and Braque, have often done the same. There is only a very tenuous separation between fiction of this sort from nonfiction; the introspective novel in the first person singular has much in common with a diary, or a volume of personal reminiscences. In his long novel *À la recherche du temps perdu*, Proust revealed himself in three ways—as the author, as the narrator, and as the characters who are projections of his own self. An autobiography once was ordinarily written toward the end of a life, as a fond recollection or an impassioned justification of a lifetime's deeds. More and more, it has come to be written also by men and women in their prime. The names of writers whose autobiographical writings have become classics is legion. Henry Adams (1838–1918) owes his place in American letters chiefly to his book on his education; in 20th-century English letters, Osbert and Sacheverell Sitwell, Leonard Woolf, and Stephen Spender may similarly survive in literature through autobiographical works. André Gide, always uncertain of his novelist's vocation, felt more at ease laying bare the secret of his life in autobiographies and journals.

Although imaginative fiction has probably suffered from excesses of introspection and of analyses of the author's own artistic pangs, knowledge of man's inner life has been enriched by such confessions. The most profound truths on human nature, however, have been expressed not in the form of autobiography but in its transposition into fiction. Readers generally have found more truth in literature created from the possibilities of life than from the personal record of the one life that the author has lived.

In conclusion, the variety of nonfictional prose is prodigious. It can be written on almost any conceivable subject. Almost any style may be used, from casual digressions or sumptuous and sonorous sentences to sharp maxims and elliptical statements. But nonfictional prose seldom gives the reader a sense of its being inevitable, as does the best poetry or fiction. Nonfictional prose seldom can answer positively the question that Rilke and D.H. Lawrence suggest that any potential writer should ask: Would I die if I were prevented from writing? (H.M.P.)

Biographical literature

One of the oldest forms of literary expression, biographical literature seeks to recreate in words the life of a human being, that of the writer himself or of another person, drawing upon the resources, memory and all available evidences—written, oral, pictorial.

ASPECTS

Historical. Biography is sometimes regarded as a branch of history, and earlier biographical writings—such as the 15th-century *Mémoires* of the French councellor of state, Philippe de Commynes, or George Cavendish's 16th-century life of Thomas Cardinal Wolsey—have often been treated as historical material rather than as literary works in their own right. Some entries in ancient Chinese chronicles included biographical sketches; imbedded in the Roman historian Tacitus' *Annals* is the most famous biography of the emperor Tiberius; conversely, Sir Winston Churchill's magnificent life of his ancestor John Churchill, first duke of Marlborough, can be read as a history (written from a special point of view) of Britain and much of Europe during the War of the Spanish Succession (1701–14). Yet there is general recognition today that history and biography are quite distinct forms of literature. History usually deals in generalizations about a period of time (for example, the Renaissance), about a group of people

in time (the English colonies in North America), about an institution (monasticism during the Middle Ages). Biography focusses upon a single human being and deals in the particulars of his life.

Both biography and history, however, are concerned with the past, and it is in the hunting down, evaluating, and selection of sources that they are akin. In this sense biography can be regarded as a craft rather than an art: techniques of research and general rules for testing evidence can be learned by anyone and thus need involve comparatively little of that personal commitment associated with art.

A biographer in pursuit of an individual long dead is usually hampered by a lack of sources: it is often impossible to check or verify what written evidence there is; there are no witnesses to cross-examine. No method has yet been developed by which to overcome such problems. Each life, however, presents its own opportunities as well as specific difficulties to the biographer: the ingenuity with which he handles gaps in the record—by providing information, for example, about the age that casts light upon the subject—has much to do with the quality of his resulting work. James Boswell knew comparatively little about Dr. Johnson's earlier years; it is one of the greatnesses of his *Life of Samuel Johnson LL.D.* (1791) that he succeeded, without inventing matter or deceiving the reader, in giving the sense of a life progressively unfolding. Another masterpiece of reconstruction in the face of little evidence is A.J.A. Symons' biography of the English author and eccentric Frederick William Rolfe, *The Quest for Corvo* (1934). A further difficulty is the unreliability of most collections of papers, letters, and other memorabilia edited before the 20th century. Not only did editors feel free to omit and transpose materials, but sometimes the authors of documents revised their personal writings for the benefit of posterity, often falsifying the record and presenting their biographers with a difficult situation when the originals were no longer extant.

Boswell's great life of Dr. Johnson

The biographer writing the life of a person recently dead is often faced with the opposite problem: an abundance of living witnesses and a plethora of materials, which include the subject's papers and letters, sometimes reports of telephone conversations and conferences transcribed from tape, as well as the record of interviews granted the biographer by his subject's friends and associates. Frank Friedel, for example, in creating a biography of the United States president Franklin D. Roosevelt (1882–1945), has had to wrestle with something like 40 tons of paper. But finally, when writing the life of any man, whether long or recently dead, the biographer's chief responsibility is vigorously to test the authenticity of his materials by whatever rules and techniques are open to him.

Psychological. Assembling a string of facts in chronological order does not constitute the life of a person, it only gives an outline of events. The biographer therefore seeks to elicit from his materials the motives for his subject's actions and to discover the shape of his personality. The biographer who has known his subject in life enjoys the advantage of his own direct impressions, often fortified by what the subject has himself revealed in conversations, and of his having lived in the same era (thus avoiding the pitfalls in depicting distant centuries). But on the debit side, such a biographer's view is coloured by the emotional factor almost inevitably present in a living association. Conversely, the biographer who knows his subject only from written evidence, and perhaps from the report of witnesses, lacks the insight generated by a personal relationship but can generally command a greater objectivity in his effort to probe his subject's inner life.

Biographers of the 20th century have had at their disposal the psychological theories and practice of Sigmund Freud and of his followers and rivals. The extent to which these new biographical tools for the unlocking of personality have been employed and the results of their use have varied greatly. On the one hand, some biographers have deployed upon their pages the apparatus of psychological revelation—analysis of behaviour symbols, interpretation based on the Oedipus complex, detection of Jungian archetypal patterns of behaviour, and the like. Other biographers, usually the authors of scholarly large-scale lives, have continued to ignore the psychological method; while still others, though avoiding explicit psychological analysis and terminology, have nonetheless presented aspects of their subjects' behaviours in such a way as to suggest psychological interpretations. In general, the movement, since World War I, has been toward a discreet use of the psychological method, from Katherine Anthony's *Margaret Fuller* (1920) and Joseph Wood Krutch's study of Edgar Allan Poe (1926), which enthusiastically embrace such techniques, through Erik Erikson's *Young Man Luther* (1958) and *Gandhi's Truth on the Origins of Militant Nonviolence* (1969), where they are adroitly and sagaciously used by a biographer who is himself a psychiatrist, to Leon Edel's vast biography of Henry James (5 vol., 1953–72), where they are used with sophistication by a man of letters. The science of psychology has also begun to affect the biographer's very approach to his subject: a number of 20th-century authors seek to explore their own involvement with the person they are writing about before embarking upon the life itself.

Psychological interpretation of behaviour

Ethical. The biographer, particularly the biographer of a contemporary, is often confronted with an ethical problem: how much of the truth, as he has been able to ascertain it, should be printed? Since the inception of biographical criticism in the later 18th century, this somewhat arid—because unanswerable—question has dominated both literary and popular discussion of biographical literature. Upon the publication of the *Life of Samuel Johnson,* James Boswell was bitterly accused of slandering his celebrated subject. More than a century and a half later, Lord Moran's *Winston Churchill: The Struggle for Survival, 1940–1965* (1966), in which Lord Moran used the Boswellian techniques of reproducing conversations from his immediate notes and jottings, was attacked in much the same terms (though the question was complicated by Lord Moran's confidential position as Churchill's physician). In the United States, William Manchester's *Death of a President* (1967), on John F. Kennedy, created an even greater stir in the popular press. There the issue is usually presented as "the public's right to know"; but for the biographer it is a problem of his obligation to preserve historical truth as measured against the personal anguish he may inflict on others in doing so. Since no standard of "biographical morality" has ever been agreed upon—Boswell, Lord Moran, and Manchester have all, for example, had eloquent defenders—the individual biographer must steer his own course. That course in the 20th century is sometimes complicated by the refusal of the custodians of the papers of important persons, particularly national political figures, to provide access to all the documents.

The public's right to know

Aesthetic. Biography, while related to history in its search for facts and its responsibility to truth, is truly a branch of literature because it seeks to elicit from facts, by selection and design, the illusion of a life actually being lived. Within the bounds of given data, the biographer seeks to transform plain information into illumination. If he invents or suppresses material in order to create an effect, he fails truth; if he is content to recount facts, he fails art. This tension, between the requirements of authenticity and the necessity for an imaginative ordering of materials to achieve lifelikeness, is perhaps best exemplified in the biographical problem of time. On the one hand, the biographer seeks to portray the unfolding of a life with all its cross-currents of interests, changing emotional states, events; yet in order to avoid reproducing the confusion and clutter of actual daily existence, he must interrupt the flow of diurnal time and group his materials so as to reveal traits of personality, grand themes of experience, and the actions and attitudes leading to moments of high decision. His achievement as a biographical artist will be measured, in great part, by his ability to suggest the sweep of chronology and yet to highlight the major patterns of behaviour that give a life its shape and meaning.

KINDS

Biographies are difficult to classify. It is easily recognizable that there are many kinds of lifewriting, but one kind can easily shade into another; no standard basis for classifi-

cation has yet been developed. A fundamental division offers, however, a useful preliminary view: biographies written from personal knowledge of the subject and those written from research.

Firsthand knowledge. The biography that results from what might be called a vital relationship between the biographer and his subject often represents a conjunction of two main biographical forces: a desire on the part of the writer to preserve "the earthly pilgrimage of a man," as the 19th-century historian Thomas Carlyle calls it (*Critical and Miscellaneous Essays,* 1838), and an awareness that he has the special qualifications, because of direct observation and access to personal papers, to undertake such a task. This kind of biography is, in one form or another, to be found in most of the cultures that preserve any kind of written biographical tradition, and it is commonly to be found in all ages from the earliest literatures to the present. In its first manifestations, it was often produced by, or based upon the recollections of, the disciples of a religious figure—such as the biographical fragments concerning Buddha, portions of the Old Testament, and the Christian gospels. It is sometimes called "source biography" because it preserves original materials, the testimony of the biographer, and often intimate papers of the subject (which have proved invaluable for later biographers and historians—as exemplified by Einhard's 9th-century *Vita Karoli imperatoris* ["Life of Charlemagne"] or Thomas Moore's *Letters and Journals of Lord Byron* [1830]). Biography based on a living relationship has produced a wealth of masterpieces: Tacitus' life of his father-in-law in the *Agricola,* William Roper's life of his father-in-law Sir Thomas More (1626), John Gibson Lockhart's biography (1837–38) of his father-in-law Sir Walter Scott, Johann Peter Eckermann's *Conversations with Goethe* (1836; trans. 1839), and Ernest Jones's *Life and Work of Sigmund Freud* (1953–57). Indeed, what is generally acknowledged as the greatest biography ever written belongs to this class: James Boswell's *Life of Samuel Johnson.*

The relationship between writer and subject

Research. Biographies that are the result of research rather than firsthand knowledge present a rather bewildering array of forms. First, however, there should be mentioned two special kinds of biographical activity.

Reference collections. Since the late 18th century, the Western world—and, in the 20th century, the rest of the world as well—has produced increasing numbers of compilations of biographical facts concerning both the living and the dead. These collections stand apart from literature. Many nations have multivolume biographical dictionaries such as the *Dictionary of National Biography* in Britain and the *Dictionary of American Biography* in the United States; general encyclopaedias contain extensive information about figures of world importance; classified collections such as *Lives of the Lord Chancellors* (Britain) and biographical manuals devoted to scholars, scientists, and other groups are available in growing numbers; information about living persons is gathered into such national collections as *Who's Who?* (Britain), *Chi è?* (Italy), and *Who's Who in America?*

Character sketches. The short life, however, is a genuine current in the mainstream of biographical literature and is represented in many ages and cultures. Excluding early quasi-biographical materials about religious or political figures, the short biography first appeared in China at about the end of the 2nd century BC, and two centuries later it was a fully developed literary form in the Roman Empire. The *Shih-chi* ("Historical Records"), by Ssu-ma Ch'ien (145?–*c.* 85 BC), include lively biographical sketches, very short and anecdotal with plentiful dialogue, grouped by character-occupation types such as "maligned statesmen," "rash generals," "assassins," a method that became established tradition with the *Han shu* (*History of the Former Han Dynasty*), by Ssu-ma Ch'ien's successor and imitator, Pan Ku (AD 32–92). Toward the end of the first century AD, in the Mediterranean world, Plutarch's *Lives of the Noble Grecians and Romans,* which are contrasting pairs of biographies, one Greek and one Roman, appeared; there followed within a brief span of years the *Lives of the Caesars,* by the Roman emperor Hadrian's librarian Suetonius. These works established a quite subtle mingling of character sketch with chronological narrative that has ever since been the dominant mark of this genre. Plutarch, from an ethical standpoint emphasizing the political virtues of man as governor, and Suetonius, from the promptings of sheer biographical curiosity, develop their subjects with telling details of speech and action; and though Plutarch, generally considered to be the superior artist, has greatly influenced other arts than biographical literature—witness Shakespeare's Roman plays, which are based on his *Lives*—Suetonius created in the *Life of Nero* one of the supreme examples of the form. Islāmic literature, from the 10th century, produced short "typed" biographies based on occupation—saints, scholars, and the like—or on arbitrarily chosen personal characteristics. The series of brief biographies has continued to the present day with such representative collections as, in the Renaissance, Giorgio Vasari's *Lives of the Most Eminent Italian Painters, Sculptors, and Architects,* Thomas Fuller's *History of the Worthies of England* in the 17th century, Samuel Johnson's *Lives of the English Poets* in the 18th, and, in more recent times, the "psychographs" of the American Gamaliel Bradford (*Damaged Souls,* 1923), Lytton Strachey's *Eminent Victorians* (1918) and the "profiles" that have become a hallmark of the weekly magazine *The New Yorker.*

The first short biography

Further classification of biographies compiled by research can be achieved by regarding the comparative objectivity of approach. For convenience, six categories, blending one into the other in infinite gradations and stretching from the most objective to the most subjective, can be employed.

Informative biography. This, the first category, is the most objective and is sometimes called "accumulative" biography. The author of such a work, avoiding all forms of interpretation except selection—for selection, even in the most comprehensive accumulation, is inevitable—seeks to unfold a life by presenting, usually in chronological order, the paper remains, the evidences, relating to that life. This biographer takes no risks but, in turn, seldom wins much critical acclaim: his work is likely to become a prime source for biographers who follow him. During the 19th century, the *Life of Milton: Narrated in Connection with the Political, Ecclesiastical, and Literary History of his Time* (7 vol., 1859–94), by David Masson, and *Abraham Lincoln: A History* (10 vol., 1890), by John G. Nicolay and John Hay, offer representative samples. In the 20th century such works as Edward Nehls's, *D.H. Lawrence: A Composite Biography* (1957–59) and David Alec Wilson's collection of the life records of Thomas Carlyle (1923–29), in six volumes, continue the traditions of this kind of life writing.

Inevitability of selection in biography

Critical biography. This second category, scholarly and critical, unlike the first, does offer a genuine presentation of a life. These works are very carefully researched; sources and "justifications" (as the French call them) are scrupulously set forth in notes, appendixes, bibliographies; inference and conjecture, when used, are duly labelled as such; no fictional devices or manipulations of material are permitted, and the life is generally developed in straight chronological order. Yet such biography, though not taking great risks, does employ the arts of selection and arrangement. The densest of these works, completely dominated by fact, have small appeal except to the specialist. Those written with the greatest skill and insight are in the first rank of modern life writing. In these scholarly biographies—the "life and times" or the minutely detailed life—the author is able to deploy an enormous weight of matter and yet convey the sense of a personality in action, as exemplified in Leslie Marchand's *Byron* (1957), with some 1,200 pages of text and 300 pages of notes, Dumas Malone's *Jefferson and his Time* (4 vol., 1948–70), Churchill's *Marlborough* (1933–38), Douglas S. Freeman's *George Washington* (1948–57). The critical biography aims at evaluating the works as well as unfolding the life of its subject, either by interweaving the life in its consideration of the works or else by devoting separate chapters to the works. Critical biography has had its share of failures: except in skillful hands, criticism clumsily intrudes upon the continuity of a life, or the works of the subject are made to yield doubtful interpretations of character, particularly

The problems of critical biography

in the case of literary figures. It has to its credit, however, such fine biographies as Arthur S. Link, *Wilson* (5 vol., 1947–65); Richard Ellmann, *James Joyce* (1959); Ernest Jones, *The Life and Works of Sigmund Freud;* Douglas S. Freeman, *Lee* (1934–35); and Edgar Johnson, *Charles Dickens* (1952).

"Standard" biography. This third, and central, category of biography, balanced between the objective and the subjective, represents the mainstream of biographical literature, the practice of biography as an art. From antiquity until the present—within the limits of the psychological awareness of the particular age and the availability of materials—this kind of biographical literature has had as its objective what Sir Edmund Gosse called "the faithful portrait of a soul in its adventures through life." It seeks to transform, by literary methods that do not distort or falsify, the truthful record of fact into the truthful effect of a life being lived. Such biography ranges in style and method from George Cavendish's 16th-century life of Cardinal Wolsey, Roger North's late-17th-century lives of his three brothers, and Boswell's life of Johnson to modern works like Lord David Cecil's *Melbourne,* Garrett Mattingly's *Catherine of Aragon,* Andrew Turnbull's *Scott Fitzgerald,* and Leon Edel's *Henry James.*

Interpretative biography. This fourth category of life writing is subjective and has no standard identity. At its best it is represented by the earlier works of Catherine Drinker Bowen, particularly her lives of Tchaikovsky, *"Beloved Friend"* (1937), and Oliver Wendell Holmes, *Yankee from Olympus* (1944). She molds her sources into a vivid narrative, worked up into dramatic scenes that always have some warranty of documentation—the dialogue, for example, is sometimes devised from the indirect discourse of letter or diary. She does not invent materials; but she quite freely manipulates them—that is to say, interprets them—according to the promptings of insight, derived from arduous research, and with the aim of unfolding her subject's life as vividly as possible. (Mrs. Bowen, much more conservative in her later works, clearly demonstrates the essential distance between the third and fourth categories: her distinguished life of Sir Edward Coke, *The Lion and the Throne* [1957], foregoes manipulation and the "recreation" of dialogue and limits interpretation to the artful deployment of biographical resources.) Very many interpretative biographies stop just short of fictionalizing in the freedom with which they exploit materials. The works of Frank Harris (*Oscar Wilde,* 1916) and Hesketh Pearson (*Tom Paine, Friend of Mankind,* 1937; *Beerbohm Tree,* 1956) demonstrate this kind of biographical latitude.

Fictionalized biography. The books in this fifth category belong to biographical literature only by courtesy. Materials are freely invented, scenes and conversations are imagined; unlike the previous category, this class often depends almost entirely upon secondary sources and cursory research. Its authors, well represented on the paperback shelves, have created a hybrid form designed to mate the appeal of the novel with a vague claim to authenticity. This form is exemplified by writers such as Irving Stone, in his *Lust for Life* (on van Gogh) and *The Agony and the Ecstasy* (on Michelangelo). Whereas the compiler of biographical information (the first category) risks no involvement, the fictionalizer admits no limit to it.

Cursory research in fictionalized biography

Fiction presented as biography. The sixth and final category is outright fiction, the novel written as biography or autobiography. It has enjoyed brilliant successes. Such works do not masquerade as lives; rather, they imaginatively take the place of biography where perhaps there can be no genuine life writing for lack of materials. Among the most highly regarded examples of this genre are, in the guise of autobiography, Robert Graves's books on the Roman emperor Claudius, *I, Claudius* and *Claudius the God and His Wife Messalina;* Mary Renault's *The King Must Die* on the legendary hero Theseus; and Marguerite Yourcenar's *Memoirs of Hadrian.* The diary form of autobiography was amusingly used by George and Weedon Grossmith to tell the trials and tribulations of their fictional character, Charles Poster, in *The Diary of a Nobody* (1892). In the form of biography this category includes Graves's *Count Belisarius* and Hope Muntz's *Golden Warrior* (on Harold II, vanquished at the Battle of Hastings, 1066). Some novels-as-biography, using fictional names, are designed to evoke rather than re-create an actual life, such as W. Somerset Maugham's *Moon and Sixpence* (Gauguin) and *Cakes and Ale* (Thomas Hardy) and Robert Penn Warren's *All the King's Men* (Huey Long).

"Special-purpose" biography. In addition to these six main categories, there exists a large class of works that might be denominated "special-purpose" biography. In these works the art of biography has become the servant of other interests. They include potboilers (written as propaganda or as a scandalous exposé) and "as-told-to" narratives (often popular in newspapers) designed to publicize a celebrity. This category includes also "campaign biographies" aimed at forwarding the cause of a political candidate (Nathaniel Hawthorne's *Life of Franklin Pierce* [1852] being an early example); the weighty commemorative volume, not infrequently commissioned by the widow (which, particularly in Victorian times, has usually enshrouded the subject in monotonous eulogy); and pious works that are properly called hagiography, or lives of holy men, written to edify the reader.

Informal autobiography. Autobiography, like biography, manifests a wide variety of forms, beginning with the intimate writings made during a life that were not intended (or apparently not intended) for publication.

Letters, diaries, and journals. Broadly speaking, the order of this category represents a scale of increasingly self-conscious revelation. Collected letters, especially in carefully edited modern editions such as W.S. Lewis' of the correspondences of the 18th-century man of letters Horace Walpole (34 vol., 1937–65), can offer a rewarding though not always predictable experience: some eminent people commit little of themselves to paper, while other lesser figures pungently re-create themselves and their world. The 15th-century *Paston Letters* constitute an invaluable chronicle of the web of daily life woven by a tough and vigorous English family among the East Anglian gentry during the Wars of the Roses; the composer Mozart and the poet Byron, in quite different ways, are among the most revealing of letter writers. Diarists have made great names for themselves out of what seems a humble branch of literature. To mention only two, in the 20th century the young Jewish girl Anne Frank created such an impact by her recording of narrow but intense experience that her words were translated to stage and screen; while a comparatively minor figure of 17th-century England, Samuel Pepys—he was secretary to the navy—has immortalized himself in a diary that exemplifies the chief qualifications for this kind of writing—candour, zest, and an unself-conscious enjoyment of self. The somewhat more formal journal is likewise represented by a variety of masterpieces, from the notebooks, which reveal the teeming, ardent brain of Leonardo da Vinci, and William Wordsworth's sister Dorothy's sensitive recording of experience in her *Journals* (1897), to French foreign minister Armand de Caulaincourt's recounting of his flight from Russia with Napoleon (translated as *With Napoleon in Russia,* 1935) and the *Journals* of the brothers Goncourt, which present a confidential history of the literary life of mid-19th-century Paris.

Memoirs and reminiscences. These are autobiographies that usually emphasize *what* is remembered rather than *who* is remembering; the author, instead of recounting his life, deals with those experiences of his life, people, and events that he considers most significant. (The extreme contrast to memoirs is the spiritual autobiography, so concentrated on the life of the soul that the author's outward life and its events remains a blur. The artless *res gestae,* a chronology of events, occupies the middle ground.)

The nature of memoirs

In the 15th century, Philippe de Commynes, modestly effacing himself except to authenticate a scene by his presence, presents in his *Mémoires* a life of Louis XI, master of statecraft, as witnessed by one of the most sagacious counsellors of the age. The memoirs of Giacomo Casanova boast of an 18th-century rake's adventures; those of Hector Berlioz explore with great brilliance the trials of a great composer, the reaches of an extraordinary personality, and the musical life of Europe in the first part

of the 19th century. The memoir form is eminently represented in modern times by Sir Osbert Sitwell's polished volumes, presenting a tapestry of recollections that, as has been observed, "tells us little about what it feels like to be in Sir Osbert's skin"—a phrase perfectly illustrating the difference between memoirs and formal autobiography.

Formal autobiography. This category offers a special kind of biographical truth: a life, reshaped by recollection, with all of recollection's conscious and unconscious omissions and distortions. The novelist Graham Greene says that, for this reason, an autobiography is only "a sort of life" and uses the phrase as the title for his own autobiography (1971). Any such work is a true picture of what, at one moment in a life, the subject wished—or is impelled—to reveal of that life. An event recorded in the autobiographer's youthful journal is likely to be somewhat different from that same event recollected in later years. Memory being plastic, the autobiographer regenerates his materials as he uses them. The advantage of possessing unique and private information, accessible to no researching biographer, is counterbalanced by the difficulty of establishing a stance that is neither overmodest nor aggressively self-assertive. The historian Edward Gibbon declares, ". . . I must be conscious that no one is so well qualified as myself to describe the service of my thoughts and actions." The 17th-century English poet Abraham Cowley provides a rejoinder: "It is a hard and nice subject for a man to write of himself; it grates his own heart to say anything of disparagement and the reader's ears to hear anything of praise from him."

There are but few and scattered examples of autobiographical literature in antiquity and the Middle Ages. In the 2nd century BC the Chinese classical historian Ssu-ma Ch'ien included a brief account of himself in the *Shihchi*, "Historical Records." It is stretching a point to include, from the 1st century BC, the letters of Cicero (or, in the early Christian era, the letters of St. Paul); and Julius Caesar's *Commentaries* tell little about Caesar, though they present a masterly picture of the conquest of Gaul and the operations of the Roman military machine at its most efficient. The *Confessions* of St. Augustine, of the 5th century AD, belong to a special category of autobiography discussed below; the 14th-century *Letter to Posterity* of the Italian poet Petrarch is but a brief excursion in the field.

The first autobiography

Speaking generally, then, it can be said that autobiography begins with the Renaissance in the 15th century; and, surprisingly enough, the first example was written not in Italy but in England by a woman entirely untouched by the "new learning" or literature. In her old age Margery Kempe, the sobbing mystic, or hysteric, of Lynn in Norfolk, dictated an account of her bustling, far-faring life, which, however concerned with religious experience, racily reveals her somewhat abrasive personality and the impact she made upon her fellows. This is done in a series of scenes, mainly developed by dialogue. Though calling herself, in abject humility, "the creature," Margery knew, and has effectively transmitted the proof, that she was a remarkable person.

The first full-scale formal autobiography was written a generation later by a celebrated Humanist publicist of the age, Enea Silvio Piccolomini, after he was elevated to the papacy, in 1458, as Pius II—the result of an election that he recounts with astonishing frankness spiced with malice. In the first book of his autobiography—misleadingly named *Commentarii*, in evident imitation of Caesar—Pius II traces his career up to becoming pope; the succeeding 11 books (and a fragment of a 12th, which breaks off a few months before his death in 1464) present a panorama of the age, with its cruel and cultivated Italian tyrants, cynical *condottieri* (professional soldiers), recalcitrant kings, the politics and personalities behind the doors of the Vatican, and the urbane but exuberant character of the Pope himself. Pius II exploits the plasticity of biographical art by creating opportunities—especially when writing of himself as the connoisseur of natural beauties and antiquities—for effective autobiographical narration. His "Commentaries" show the art of formal autobiography in full bloom in its beginnings; they rank as one of its half dozen greatest exemplars.

The neglected autobiography of the Italian physician and astrologer Gironimo Cardano, a work of great charm, and the celebrated adventures of the goldsmith and sculptor Benvenuto Cellini in Italy of the 16th century; the uninhibited autobiography of the English historian and diplomat Lord Herbert of Cherbury, in the early 17th; and Colley Cibber's *Apology for The Life of Colley Cibber, Comedian* in the early 18th—these are representative examples of biographical literature from the Renaissance to the Age of Enlightenment. The latter period itself produced three works that are especially notable for their very different reflections of the spirit of the times as well as of the personalities of their authors: the urbane autobiography of Edward Gibbon, the great historian; the plainspoken, vigorous success story of an American who possessed all the talents, Benjamin Franklin; and the somewhat morbid introspection of a revolutionary Swiss-French political and social theorist, the *Confessions* of J.-J. Rousseau—the latter leading to two autobiographical explorations in poetry during the Romantic Movement (flourished 1798–1837) in England, Wordsworth's *Prelude* and Byron's *Childe Harold*, cantos III and IV. Significantly, it is at the end of the 18th century that the word autobiography apparently first appears in print, in *The Monthly Review*, 1797.

Autobiography in the Age of Enlightenment

Specialized forms. These might roughly be grouped under four heads: thematic, religious, intellectual, and fictionalized. The first grouping includes books with such diverse purposes as Adolf Hitler's *Mein Kampf* (1924), *The Americanization of Edward Bok* (1920), and Richard Wright's *Native Son* (1940). Religious autobiography claims a number of great works, ranging from the *Confessions* of St. Augustine and Peter Abelard's *Historia Calamitatum* (*The Story of My Misfortunes*) in the Middle Ages to the autobiographical chapters of Thomas Carlyle's *Sartor Resartus* ("The Everlasting No," "Centre of Indifference," "The Everlasting Yea") and Cardinal John Newman's beautifully wrought *Apologia* in the 19th century. That century and the early 20th saw the creation of several intellectual autobiographies. The *Autobiography* of the philosopher John S. Mill, severely analytical, concentrates upon "an education which was unusual and remarkable." It is paralleled, across the Atlantic, in the bleak but astringent quest of *The Education of Henry Adams* (printed privately 1906; published 1918). Edmund Gosse's sensitive study of the difficult relationship between himself and his Victorian father, *Father and Son* (1907), and George Moore's quasi-novelized crusade in favour of Irish art, *Hail and Farewell* (1911–14), illustrate the variations of intellectual autobiography. Finally, somewhat analogous to the novel as biography (for example, Graves's *I, Claudius*) is the autobiography thinly disguised as, or transformed into, the novel. This group includes such works as Samuel Butler's *Way of All Flesh* (1903), James Joyce's *Portrait of the Artist as a Young Man* (1916), George Santayana's *Last Puritan* (1935), and the gargantuan novels of Thomas Wolfe (*Look Homeward, Angel* [1929], *Of Time and the River* [1935]).

HISTORICAL DEVELOPMENT

Western literature. *Antiquity.* In the Western world, biographical literature can be said to begin in the 5th century BC with the poet Ion of Chios, who wrote brief sketches of such famous contemporaries as Pericles and Sophocles. It continued throughout the classical period for a thousand years, until the dissolution of the Roman Empire in the 5th century AD. Broadly speaking, the first half of this period exhibits a considerable amount of biographical activity, of which much has been lost; such fragments as remain of the rest—largely funeral elegies and rhetorical exercises depicting ideal types of character or behaviour—suggest that from a literary point of view the loss is not grievous. (An exception is the life of the Roman art patron Pomponius Atticus, written in the 1st century BC by Cornelius Nepos.) Biographical works of the last centuries in the classical period, characterized by numerous sycophantic accounts of emperors, share the declining energies of the other literary arts. But although there are few genuine examples of life writing, in the modern sense of the term, those few are masterpieces. The two greatest teachers

of the classical Mediterranean world, Socrates and Jesus Christ, both prompted the creation of magnificent biographies written by their followers. To what extent Plato's life of Socrates keeps to strict biographical truth cannot now be ascertained (though the account of Socrates given by Plato's contemporary the soldier Xenophon, in his *Memorabilia,* suggests a reasonable faithfulness) and he does not offer a full-scale biography. Yet in his two consummate biographical dialogues—*The Apology* (recounting the trial and condemnation of Socrates) and the *Phaedo* (a portrayal of Socrates' last hours and death)—he brilliantly recreates the response of an extraordinary character to the crisis of existence. Some 400 years later there came into being four lives of Jesus, the profound religious significance of which has inevitably obscured their originality—their homely detail, anecdotes, and dialogue that, though didactic in purpose, also evoke a time and a personality. The same century, the first of the Christian era, gave birth to the three first truly "professional" biographers—Plutarch and Suetonius (discussed above) and the historian Tacitus, whose finely wrought biography of his father-in-law, *Agricola,* concentrating on the administration rather than the man, has something of the monumental quality of Roman architecture. The revolution in thought and attitude brought about by the growth of Christianity is signalled in a specialized autobiography, the *Confessions* of St. Augustine; but the biographical opportunity suggested by Christian emphasis on the individual soul was, oddly, not to be realized. If the blood of the martyrs fertilized the seed of the new faith, it did not promote the art of biography. The demands of the church and the spiritual needs of men, in a twilight world of superstition and violence, transformed biography into hagiography. There followed a thousand years of saints' lives: the art of biography forced to serve ends other than its own.

Plato's accounts of Socrates

Middle Ages. This was a period of biographical darkness, an age dominated by the priest and the knight. The priest shaped biography into an exemplum of otherworldliness, while the knight found escape from daily brutishness in allegory, chivalric romances, and broad satire (the fabliaux). Nevertheless, glimmerings can be seen. A few of the saints' lives, like Eadmer's *Life of Anselm,* contain anecdotal materials that give some human flavour to their subjects; the 13th-century French nobleman Jean, sire de Joinville's life of St. Louis (Louis IX of France), *Mémoires,* offers some lively scenes. The three most interesting biographical manifestations came early. Bishop Gregory of Tours' *History of the Franks* depicts artlessly but vividly, from firsthand observation, the lives and personalities of the four grandsons of Clovis and their fierce queens in Merovingian Gaul of the 6th century. Bede's *Ecclesiastical History of the English People,* of the 8th century, though lacking the immediacy and exuberance—and the violent protagonists—of Gregory, presents some valuable portraits, like those of "the little dark man," Paulinus, who converted the King of Northumbria to Christianity.

Einhard's *Life of Charlemagne*

Most remarkable, however, a self-consciously wrought work of biography came into being in the 9th century: this was *The Life of Charlemagne,* written by a cleric at his court named Einhard. He is aware of his biographical obligations and sets forth his point of view and his motives:

> I have been careful not to omit any facts that could come to my knowledge, but at the same time not to offend by a prolix style those minds that despise everything modern .... No man can write with more accuracy than I of events that took place about me, and of facts concerning which I had personal knowledge....

He composes the work in order to ensure that Charlemagne's life is not "wrapped in the darkness of oblivion" and out of gratitude for "the care that King Charles bestowed upon me in my childhood, and my constant friendship with himself and his children." Though Einhard's biography, by modern standards, lacks sustained development, it skillfully reveals the chief patterns of Charlemagne's character—his constancy of aims, powers of persuasion, passion for education. Einhard's work is far closer to modern biography than the rudimentary poetry and drama of his age are to their modern counterparts.

Renaissance. Like the other arts, biography stirs into fresh life with the Renaissance in the 15th century. Its most significant examples were autobiographical, as has already been mentioned. Biography was chiefly limited to uninspired panegyrics of Italian princes by their court Humanists, such as Simonetta's life of the great *condottiere,* Francesco Sforza, duke of Milan.

During the first part of the 16th century in England, now stimulated by the "new learning" of Erasmus, John Colet, Thomas More, and others, there were written three works that can be regarded as the initiators of modern biography: More's *History of Richard III,* William Roper's *Mirrour of Vertue in Worldly Greatness; or, the life of Syr Thomas More,* and George Cavendish's *Life of Cardinal Wolsey.* The *History of Richard III* (written about 1513 in both an English and a Latin version) unfortunately remains unfinished; and it cannot meet the strict standards of biographical truth since, under the influence of classical historians, a third of the book consists of dialogue that is not recorded from life. However, it is a brilliant work, exuberant of wit and irony, that not only constitutes a biographical landmark but is also the first piece of modern English prose. With relish, More thus sketches Richard's character:

> He was close and secret, a deep dissembler, lowly of countenance, arrogant of heart, outwardly companionable where he inwardly hated, not hesitating to kiss whom he thought to kill.

Worked up into dramatic scenes, this biography, as reproduced in the *Chronicles* of Edward Hall and Raphael Holinshed, later provided both source and inspiration for Shakespeare's rousing melodramatic tragedy, *Richard III.* The lives written by Roper and Cavendish display interesting links, though the two men were not acquainted: they deal with successive first ministers destroyed by that brutal master of politics, Henry VIII; they are written from first hand observation of their subjects by, respectively, a son-in-law and a household officer; and they exemplify, though never preach, a typically Renaissance theme: *Indignatio principis mors est*—"the Prince's anger is death." Roper's work is shorter, more intimate, and simpler; in a series of moving moments it unfolds the struggle within Sir Thomas More between his duty to conscience and his duty to his king. Cavendish offers a more artful and richly developed narrative, beautifully balanced between splendid scenes of Wolsey's glory and vanity and ironically contrasting scenes of disgrace, abasement, and painfully achieved self-knowledge.

Biography in the Renaissance

The remaining period of the Renaissance, however, is disappointingly barren. In Russia, where medieval saints' lives had also been produced, there appears a modest biographical manifestation in the *Stepennaya Kniga* ("Book of Degrees," 1563), a collection of brief lives of princes and prelates. Somewhat similarly, in France, which was torn by religious strife, Pierre Brantôme wrote his *Lives of Famous Ladies* and *Lives of Famous Men.* The Elizabethan Age in England, for all its magnificent flowering of the drama, poetry, and prose, did not give birth to a single biography worthy of the name. Sir Fulke Greville's account of Sir Philip Sidney (1652) is marred by tedious moralizing; Francis Bacon's accomplished life of the first Tudor monarch, *The Historie of the Raigne of King Henry the Seventh* (1622), turns out to be mainly a history of the reign. But Sir Walter Raleigh suggests an explanation for this lack of biographical expression in the introduction to his *History of the World* (1614): "Whosoever, in writing a modern history, shall follow truth too near the heels, it may haply strike out his teeth"—as Sir John Hayward could testify, having been imprisoned in the Tower of London because his account (1599) of Richard II's deposition, two centuries earlier, had aroused Queen Elizabeth's anger.

17th and 18th centuries. In the 17th century the word biography was first employed to create a separate identity for this type of writing. That century and the first half of the 18th presents a busy and sometimes bizarre biographical landscape. It was an era of experimentation and preparation rather than of successful achievement. In the New World, the American Colonies began to develop a scattered biographical activity, none of it of lasting impor-

tance. France offers the celebrated *Letters* of the Marquise de Sévigné to her daughter, an intimate history of the Age of Louis XIV; numerous memoirs, such as those of Louis de Rouvroy, duc de Saint-Simon, and the acerbic ones of the Cardinal de Retz (1717); and the philosopher and critic Pierre Bayle's *Dictionnaire historique et critique* (1697), which was followed by specialized biographical collections and reference works. England saw an outpouring, beginning in the earlier 17th century, of Theophrastan "characters" (imaginary types imitated from the work of Theophrastus, a follower of Aristotle), journals, diaries, the disorganized but vivid jottings of John Aubrey (later published in 1898 as *Brief Lives*); and in the earlier 18th century there were printed all manner of sensational exposés, biographical sketches of famous criminals, and the like. In this era women appear for the first time as biographers. Lady Fanshawe wrote a life of her ambassador-husband (1829); Lucy Hutchinson, one of her Puritan warrior-husbands (written after 1664, published 1806); and Margaret Cavendish, duchess of Newcastle, produced a warm, bustling life—still good reading today—of her duke, an amiable mediocrity (*The Life of the thrice Noble Prince William Cavendishe, Duke Marquess, and Earl of Newcastle*, 1667). This age likewise witnessed the first approach to a professional biographer, the noted lover of angling, Izaak Walton, whose five lives (of the poets John Donne [1640] and George Herbert [1670], the diplomat Sir Henry Wotton [1651], and the ecclesiastics Richard Hooker [1665] and Robert Sanderson [1678]) tend to endow their diverse subjects with something of Walton's own genteel whimsicality but nonetheless create skillful biographical portraits. The masterpieces of the age are unquestionably Roger North's biographies (not published until 1742, 1744) of his three brothers: Francis, the lord chief justice, "my best brother"; the lively merchant-adventurer Sir Dudley, his favourite; and the neurotic scholar John. Also the author of an autobiography, Roger North likewise produced, as a preface to his life of Francis, the first extensive critical essay on biography, which anticipates some of the ideas of Samuel Johnson and James Boswell.

The first "professional" biographer

The last half of the 18th century witnessed the remarkable conjunction of these two remarkable men, from which sprang what is generally agreed to be the world's supreme biography, Boswell's *Life of Samuel Johnson LL.D.* (1791). Dr. Johnson, literary dictator of his age, critic and lexicographer who turned his hand to many kinds of literature, himself created the first English professional biographies in *The Lives of the English Poets*. In essays and in conversation, Johnson set forth principles for biographical composition: the writer must tell the truth—"the business of the biographer is often to . . . display the minute details of daily life," for it is these details that re-create a living character; and men need not be of exalted fame to provide worthy subjects.

For more than one reason the somewhat disreputable and incredibly diligent Scots lawyer James Boswell can be called the unique genius of biographical literature, bestriding both autobiography and biography. Early in his acquaintance with Johnson he was advised by the Doctor "to keep a journal of my [Boswell's] life, full and unreserved." Boswell followed this advice to the letter. His gigantic journals offer an unrivalled self-revelation of a fascinatingly checkered character and career—whether as a young rake in London or thrusting himself upon the aged Rousseau or making his way to Voltaire's seclusion at Ferney in Switzerland with the aim of converting that celebrated skeptic to Christianity. Boswell actively helped to stage the life of Johnson that he knew he was going to write—drawing out Johnson in conversation, setting up scenes he thought likely to yield rich returns—and thus, at moments, he achieved something like the novelist's power over his materials, being himself an active part of what he was to re-create. Finally, though he invented no new biographical techniques, in his *Life of Samuel Johnson* he interwove with consummate skill Johnson's letters and personal papers, Johnson's conversation as assiduously recorded by the biographer, material drawn from interviews with large numbers of people who knew Johnson, and his own observation of Johnson's behaviour, to elicit the living texture of a life and a personality. Boswell makes good his promise that Johnson "will be seen as he really was . . . ." The influence of Boswell's work penetrated throughout the world and, despite the development of new attitudes in biographical literature, has persisted to this day as a pervasive force. Perhaps equally important to life writers has been the inspiration provided by the recognition accorded Boswell's *Life* as a major work of literary art. Since World War II there have often been years, in the United States, when the annual bibliographies reveal that more books or articles were published about Johnson and Boswell than about all the rest of biographical literature together.

Boswell's influence on biography

19th century. The *Life of Johnson* may be regarded as a representative psychological expression of the Age of Enlightenment, and it certainly epitomizes several typical characteristics of that age: devotion to urban life, confidence in common sense, emphasis on man as a social being. Yet in its extravagant pursuit of the life of one individual, in its laying bare the eccentricities and suggesting the inner turmoil of personality, it may be thought of as part of that revolution in self-awareness, ideas, aspirations, exemplified in Rousseau's *Confessions*, the French Revolution, the philosophical writings of the German philosopher Immanuel Kant, the political tracts of Thomas Paine, and the works of such early Romantic poets as Robert Burns, William Blake, Wordsworth—a revolution that in its concern with the individual psyche and the freedom of man seemed to augur well for biographical literature. This promise, however, was not fulfilled in the 19th century.

That new nation, the United States of America, despite the stimulus of a robust and optimistic society, flamboyant personalities on the frontier, a generous share of genius, and the writing of lives by eminent authors such as Washington Irving and Henry James, produced no biographies of real importance. One professional biographer, James Parton, published competent, well-researched narratives, such as his lives of Aaron Burr and Andrew Jackson, but they brought him thin rewards and are today outmoded. In France, biography was turned inward, to romantic introspection, a trend introduced by Étienne Pivert de Senancour's *Obermann* (1804). It was followed by autobiographies thinly disguised as novels such as Benjamin Constant's *Adolphe* (1816), *La Vie de Henri Brulard* of Stendhal (Marie Henri Beyle), and similar works by Alphonse de Lamartine and Alfred de Musset, in which the emotional malaise of the hero is subjected to painstaking analysis. In Great Britain the 19th century opened promisingly with an outburst of biographical–autobiographical production, much of which came from prominent figures of the Romantic Movement, including Samuel Taylor Coleridge, Robert Southey, William Hazlitt, and Thomas De Quincey. Thomas Moore's *Letters and Journals of Lord Byron* (1830), John Gibson Lockhart's elaborate life (1837–38) of his father-in-law, Sir Walter Scott, and, later, Elizabeth Cleghorn Gaskells' *Life of Charlotte Bronte* (1857), James Anthony Froude's study of Carlyle (2 vol. 1882; 2 vol. 1884), John Forster's *Life of Charles Dickens* (1872–74) all followed, to some degree, what may loosely be called the Boswell formula. Yet most of these major works are marred by evasions and omissions of truth—though Lockhart and Froude, for example, were attacked as conscienceless despoilers of the dead—and, before the middle of the century, biography was becoming stifled. As the 20th century biographer and critic Sir Harold Nicolson wrote in *The Development of English Biography* (1927), "Then came earnestness, and with earnestness hagiography descended on us with its sullen cloud . . . ." Insistence on respectability, at the expense of candour, had led Carlyle to observe acridly, "How delicate, how decent is English biography, bless its mealy mouth!" and to pillory its productions as "vacuum-biographies."

Biography during the Victorian age

20th century. The period of modern biography was ushered in, generally speaking, by World War I. All the arts were in ferment, and biographical literature shared in the movement, partly as a reaction against 19th-century conventions, partly as a response to advances in psychology, and partly as a search for new means of expression. This

revolution, unlike that at the end of the 18th century, was eventually destined to enlarge and enhance the stature of biography. The chief developments of modern life writing may be conveniently classified under five heads: (1) an increase in the numbers and general competence of biographies throughout the Western world; (2) the influence on biographical literature of the counterforces of science and fictional writing; (3) the decline of formal autobiography and of biographies springing from a personal relationship; (4) the range and variety of biographical expression; and (5) the steady, though moderate, growth of a literature of biographical criticism. Only the first three of these developments need much elaboration.

Little has been said about biography since the Renaissance in Germany, Spain, Italy, Scandinavia, and the Slavic countries because, as in the case of Russia, there had been comparatively little biographical literature and because biographical trends, particularly since the end of the 18th century, generally followed those of Britain and France. Russian literary genius in prose is best exemplified during both the 19th and 20th centuries in the novel. In the 19th century, however, Leo Tolstoy's numerous autobiographical writings, such as *Childhood* and *Boyhood,* and Sergey Aksakov's *Years of Childhood* and *A Russian Schoolboy,* and in the 20th century, Maksim Gorky's autobiographical trilogy (*Childhood: In the World;* and *My Universities,* 1913–23) represent, in specialized form, a limited biographical activity. The close control of literature exercised by the 20th-century Communist governments of eastern Europe has created a wintry climate for biography. The rest of Europe, outside the iron curtain, has manifested in varying degrees the fresh biographical energies and practices illustrated in British–American life writing: biography is now, as never before, an international art that shares a more or less common viewpoint.

The second characteristic of modern biography, its being subject to the opposing pressures of science and fictional writing, has a dark as well as a bright side. Twentieth-century fiction, boldly and restlessly experimental, has, on the one hand, influenced the biographer to aim at literary excellence, to employ devices of fiction suitable for biographical ends; but, on the other, fiction has also probably encouraged the production of popular pseudo-biography, hybrids of fact and fancy, as well as of more subtle distortions of the art form. Science has exerted two quite different kinds of pressure: the prestige of the traditional sciences, in their emphasis on exactitude and rigorous method, has undoubtedly contributed to a greater diligence in biographical research and an uncompromising scrutiny of evidences; but science's vast accumulating of facts—sometimes breeding the worship of fact for its own sake—has helped to create an atmosphere in which today's massive, note-ridden and fact-encumbered lives proliferate and has probably contributed indirectly to a reluctance in the scholarly community to take the risks inevitable in true biographical composition.

Influence of fiction on biography

The particular science of psychology, as earlier pointed out, has conferred great benefits upon the responsible practitioners of biography. It has also accounted in large part, it would appear, for the third characteristic of modern biography: the decline of formal autobiography and of the grand tradition of biography resulting from a personal relationship. For psychology has rendered the self more exposed but also more elusive, more fascinatingly complex and, in the darker reaches, somewhat unpalatable. Since honesty would force the autobiographer into a self-examination both formidable to undertake and uncomfortable to publish, instead he generally turns his attention to outward experiences and writes memoirs and reminiscences—though France offers something of an exception in the journals of such writers as André Gide (1947–51), Paul Valéry (1957), François Mauriac (1934–50), Julien Green (1938–58). Similarly, psychology, in revealing the fallacies of memory, the distorting power of an emotional relationship, the deceits of observation, has probably discouraged biography written by a friend of its subject. Moreover, so many personal papers are today preserved that a life-long friend of the subject scarcely has time to complete his biography.

The impact of Lytton Strachey

After World War I, the work of Lytton Strachey played a somewhat similar role to that of Boswell in heading a "revolution" in biography. *Eminent Victorians* and *Queen Victoria* (1921), followed by *Elizabeth and Essex* (1928), with their artful selection, lacquered style, and pervasive irony, exerted an almost intoxicating influence in the 1920s and '30s. Writers seeking to capitalize on Strachey's popularity and ape Strachey's manner, without possessing Strachey's talents, produced a spate of "debunking" biographies zestfully exposing the clay feet of famous historical figures. By World War II, however, this kind of biography had been discredited; Strachey's adroit detachment and literary skill were recognized to be his true value, not his dangerously interpretative method; and, since that time, biography has steadied into an established, if highly varied, form of literature.

Other literatures. Biography as an independent art form, with its concentration upon the individual life and its curiosity about the individual personality, is essentially a creation of Western man. In the Orient, for all its long literary heritage, and in Islām, too, biographical literature does not show the development, nor assume the importance, of Western life writing. In China, until comparatively recently, biography had been an appendage, or by-product, of historical writing and scholarly preoccupation with the art of government, in the continuing tradition of the "Historical Records" of Ssu-ma Ch'ien and Pan Ku. In India it has been the enduring concern for spiritual values and for contemplation or mystical modes of existence that have exerted the deepest influence on literature from the first millennium BC to the present, and this has not provided a milieu suitable to biographical composition. Generally speaking, the literary history of Japan, too, offers only fragmentary or limited examples of life writing.

It was not until the beginning of the 20th century in China that biography began to appear as an independent form (and this was evidently the result of western influence), when Liang Ch'i-ch'ao (1873–1929) wrote a number of lives, including one of Confucius, and was followed by Hu Shih (1891–1962), who, like his predecessor, worked to promote biographical composition as an art form. Except for China after the establishment of the Communist state in 1949, biography in the Orient—notably in India and Japan—has shared, to a limited extent, the developments in biographical literature demonstrated in the rest of the world.

BIOGRAPHICAL LITERATURE TODAY

In the United States, Great Britain, and the rest of the Western world generally, biography today enjoys a moderate popular and critical esteem. In the year 1929, at the height of the biographical "boom," there were published in the United States 667 new biographies; in 1962 exactly the same number appeared, the population in the meantime having increased by something like 50 percent. On the average, in the English-speaking world, biographical titles account for approximately 5 percent of the annual output of books. Yet they have won their share of literary prizes and for their authors a considerable degree of literary eminence; if few universally acclaimed masterpieces are being produced, it is probably true that the art of biography is seeing a higher general level of achievement than ever before. The recreation of a life is also now being attempted in other media than that of prose. Biographical drama has of course been staged from before the time of Shakespeare; it continues to be popular, whether translated from narrative to the theatre (as the *Diary of Anne Frank*) or written specifically for the stage, like Jean Anouilh's *Becket* and Robert Bolt's study of Sir Thomas More, *A Man for All Seasons* (which nonetheless owes a great deal to William Roper). The cinema often follows with its versions of such plays; it likewise produces original biographical films, generally with indifferent success. Television, too, offers historical "recreations" of various sorts, and with varying degrees of responsibility, but has achieved only a few notable examples of biographical illumination, for the conflict between gripping visual presentation and the often undramatic, but important, biographical truth is difficult to resolve. Biography, indeed, seems less innovative, less

rewarding of experiment, and less adaptable to new media, than does fiction or perhaps even history. Words are no longer the only way to tell a story and perhaps in time will not be regarded as the chief way; but so far they seem the best way of unfolding the full course of a life and exploring the quirks and crannies of a personality. Anchored in the truth of fact, though seeking the truth of interpretation, biography tends to be more stable than other literary arts; and its future would appear to be a predictably steady evolution of its present trends. (P.M.K.)

Literary criticism

Construed loosely, literary criticism is the reasoned consideration of literary works and issues. It applies, as a term, to any argumentation about literature, whether or not specific works are analyzed. Plato's cautions against the risky consequences of poetic inspiration in general in his *Republic* are thus often taken as the earliest important example of literary criticism. More strictly construed, the term covers only what has been called "practical criticism," the interpretation of meaning and the judgment of quality. Criticism in this narrow sense can be distinguished not only from aesthetics (the philosophy of artistic value) but also from other matters that may concern the student of literature: biographical questions, bibliography, historical knowledge, sources and influences, and problems of method. Thus, especially in academic studies, "criticism" is often considered to be separate from "scholarship." In practice, however, this distinction often proves artificial, and even the most single-minded concentration on a text may be informed by outside knowledge, while many notable works of criticism combine discussion of texts with broad arguments about the nature of literature and the principles of assessing it. Criticism will here be taken to cover all phases of literary understanding, though the emphasis will be on the evaluation of literary works and of their authors' places in literary history. One particular aspect of literary criticism is covered in the article HISTORY, THE STUDY OF: *Textual criticism.* The following article deals with criticism largely in the context of Western literature. Its role in other literatures, along with the history of the literatures themselves, is treated in articles on the arts of various peoples, such as SOUTH ASIAN ARTS and AFRICAN ARTS.

Criticism and scholarship

FUNCTIONS

The functions of literary criticism vary widely, ranging from the reviewing of books as they are published to systematic theoretical discussion. Though reviews may sometimes determine whether a given book will be widely sold, many works succeed commercially despite negative reviews, and many classic works, including Herman Melville's *Moby Dick* (1851), have acquired appreciative publics long after being unfavourably reviewed and at first neglected. One of criticism's principal functions is to express the shifts in sensibility that make such revaluations possible. The minimal condition for such a new appraisal is, of course, that the original text survive. The literary critic is sometimes cast in the role of scholarly detective, unearthing, authenticating, and editing unknown manuscripts. Thus, even rarefied scholarly skills may be put to criticism's most elementary use, the bringing of literary works to a public's attention.

The variety of criticism's functions is reflected in the range of publications in which it appears. Criticism in the daily press rarely displays sustained acts of analysis and may sometimes do little more than summarize a publisher's claims for a book's interest. Weekly and biweekly magazines serve to introduce new books but are often more discriminating in their judgments, and some of these magazines, such as *The* (London) *Times Literary Supplement* and *The New York Review of Books,* are far from indulgent toward popular works. Sustained criticism can also be found in monthlies and quarterlies with a broad circulation, in "little magazines" for specialized audiences, and in scholarly journals and books.

Because critics often try to be lawgivers, declaring which works deserve respect and presuming to say what they are "really" about, criticism is a perennial target of resentment. Misguided or malicious critics can discourage an author who has been feeling his way toward a new mode that offends received taste. Pedantic critics can obstruct a serious engagement with literature by deflecting attention toward inessential matters. As the French philosopher-critic Jean-Paul Sartre observed, the critic may announce that French thought is a perpetual colloquy between Pascal and Montaigne not in order to make those thinkers more alive but to make thinkers of his own time more dead. Criticism can antagonize authors even when it performs its function well. Authors who regard literature as needing no advocates or investigators are less than grateful when told that their works possess unintended meaning or are imitative or incomplete.

Criticism as a target of criticism

What such authors may tend to forget is that their works, once published, belong to them only in a legal sense. The true owner of their works is the public, which will appropriate them for its own concerns regardless of the critic. The critic's responsibility is not to the author's self-esteem but to the public and to his own standards of judgment, which are usually more exacting than the public's. Justification for his role rests on the premise that literary works are not in fact self-explanatory. A critic is socially useful to the extent that society wants, and receives, a fuller understanding of literature than it could have achieved without him. In filling this appetite, the critic whets it further, helping to create a public that cares about artistic quality. Without sensing the presence of such a public, an author may either prostitute his talent or squander it in sterile acts of defiance. In this sense, the critic is not a parasite but, potentially, someone who is responsible in part for the existence of good writing in his own time and afterward.

Although some critics believe that literature should be discussed in isolation from other matters, criticism usually seems to be openly or covertly involved with social and political debate. Since literature itself is often partisan, is always rooted to some degree in local circumstances, and has a way of calling forth affirmations of ultimate values, it is not surprising that the finest critics have never paid much attention to the alleged boundaries between criticism and other types of discourse. Especially in modern Europe, literary criticism has occupied a central place in debate about cultural and political issues. Sartre's own *What Is Literature?* (1947) is typical in its wide-ranging attempt to prescribe the literary intellectual's ideal relation to the development of his society and to literature as a manifestation of human freedom. Similarly, some prominent American critics, including Alfred Kazin, Lionel Trilling, Kenneth Burke, Philip Rahv, and Irving Howe, began as political radicals in the 1930s and sharpened their concern for literature on the dilemmas and disillusionments of that era. Trilling's influential *The Liberal Imagination* (1950) is simultaneously a collection of literary essays and an attempt to reconcile the claims of politics and art.

Such a reconciliation is bound to be tentative and problematic if the critic believes, as Trilling does, that literature possesses an independent value and a deeper faithfulness to reality than is contained in any political formula. In Marxist states, however, literature has usually been considered a means to social ends and, therefore, criticism has been cast in forthrightly partisan terms. Dialectical materialism does not necessarily turn the critic into a mere guardian of party doctrine, but it does forbid him to treat literature as a cause in itself, apart from the working class's needs as interpreted by the party. Where this utilitarian view prevails, the function of criticism is taken to be continuous with that of the state itself, namely, furtherance of the social revolution. The critic's main obligation is not to his texts but rather to the masses of people whose consciousness must be advanced in the designated direction. In periods of severe orthodoxy, the practice of literary criticism has not always been distinguishable from that of censorship.

Criticism in Marxist states

HISTORICAL DEVELOPMENT

Antiquity. Although almost all of the criticism ever written dates from the 20th century, questions first posed

by Plato and Aristotle are still of prime concern, and every critic who has attempted to justify the social value of literature has had to come to terms with the opposing argument made by Plato in *The Republic*. The poet as a man and poetry as a form of statement both seemed untrustworthy to Plato, who depicted the physical world as an imperfect copy of transcendent ideas and poetry as a mere copy of the copy. Thus, literature could only mislead the seeker of truth. Plato credited the poet with divine inspiration, but this, too, was cause for worry; a man possessed by such madness would subvert the interests of a rational polity. Poets were therefore to be banished from the hypothetical republic.

In his *Poetics*—still the most respected of all discussions of literature—Aristotle countered Plato's indictment by stressing what is normal and useful about literary art. The tragic poet is not so much divinely inspired as he is motivated by a universal human need to imitate, and what he imitates is not something like a bed (Plato's example) but a noble action. Such imitation presumably has a civilizing value for those who empathize with it. Tragedy does arouse emotions of pity and terror in its audience, but these emotions are purged in the process (*katharsis*). In this fashion Aristotle succeeded in portraying literature as satisfying and regulating human passions instead of inflaming them.

Although Plato and Aristotle are regarded as antagonists, the narrowness of their disagreement is noteworthy. Both maintain that poetry is mimetic, both treat the arousing of emotion in the perceiver, and both feel that poetry takes its justification, if any, from its service to the state. It was obvious to both men that poets wielded great power over others. Unlike many modern critics who have tried to show that poetry is more than a pastime, Aristotle had to offer reassurance that it was not socially explosive.

Aristotle's practical contribution to criticism, as opposed to his ethical defense of literature, lies in his inductive treatment of the elements and kinds of poetry. Poetic modes are identified according to their means of imitation, the actions they imitate, the manner of imitation, and its effects. These distinctions assist the critic in judging each mode according to its proper ends instead of regarding beauty as a fixed entity. The ends of tragedy, as Aristotle conceived them, are best served by the harmonious disposition of six elements: plot, character, diction, thought, spectacle, and song. Thanks to Aristotle's insight into universal aspects of audience psychology, many of his dicta have proved to be adaptable to genres developed long after his time.

Later Greek and Roman criticism offers no parallel to Aristotle's originality. Much ancient criticism, such as that of Cicero, Horace, and Quintilian in Rome, was absorbed in technical rules of exegesis and advice to aspiring rhetoricians. Horace's verse epistle *The Art of Poetry* is an urbane amplification of Aristotle's emphasis on the decorum or internal propriety of each genre, now including lyric, pastoral, satire, elegy, and epigram, as well as Aristotle's epic, tragedy, and comedy. This work was later to be prized by Neoclassicists of the 17th century not only for its rules but also for its humour, common sense, and appeal to educated taste. *On the Sublime*, by the Roman-Greek known as "Longinus," was to become influential in the 18th century but for a contrary reason: when decorum began to lose its sway encouragement could be found in Longinus for arousing elevated and ecstatic feeling in the reader. Horace and Longinus developed, respectively, the rhetorical and the affective sides of Aristotle's thought, but Longinus effectively reversed the Aristotelian concern with regulation of the passions.

Horatian and Longinian tendencies

Medieval period. In the Christian Middle Ages criticism suffered from the loss of nearly all the ancient critical texts and from an antipagan distrust of the literary imagination. Such Church Fathers as Tertullian, Augustine, and Jerome renewed, in churchly guise, the Platonic argument against poetry. But both the ancient gods and the surviving classics reasserted their fascination, entering medieval culture in theologically allegorized form. Encyclopaedists and textual commentators explained the supposed Christian content of pre-Christian works and the Old Testament. Although there was no lack of rhetoricians to dictate the correct use of literary figures, no attempt was made to derive critical principles from emergent genres such as the fabliau and the chivalric romance. Criticism was in fact inhibited by the very coherence of the theologically explained universe. When nature is conceived as endlessly and purposefully symbolic of revealed truth, specifically literary problems of form and meaning are bound to be neglected. Even such an original vernacular poet of the 14th century as Dante appears to have expected his *Divine Comedy* to be interpreted according to the rules of scriptural exegesis.

The Renaissance. Renaissance criticism grew directly from the recovery of classic texts and notably from Giorgio Valla's translation of Aristotle's *Poetics* into Latin in 1498. By 1549 the *Poetics* had been rendered into Italian as well. From this period until the later part of the 18th century Aristotle was once again the most imposing presence behind literary theory. Critics looked to ancient poems and plays for insight into the permanent laws of art. The most influential of Renaissance critics was probably Lodovico Castelvetro, whose 1570 commentary on Aristotle's *Poetics* encouraged the writing of tightly structured plays by extending and codifying Aristotle's idea of the dramatic unities. It is difficult today to appreciate that this obeisance to antique models had a liberating effect; one must recall that imitation of the ancients entailed rejecting scriptural allegory and asserting the individual author's ambition to create works that would be unashamedly great and beautiful. Classicism, individualism, and national pride joined forces against literary asceticism. Thus, a group of 16th-century French writers known as the Pléiade—notably Pierre de Ronsard and Joachim du Bellay—were simultaneously classicists, poetic innovators, and advocates of a purified vernacular tongue.

Classicism, individualism, and national pride as literary forces

The ideas of the Italian and French Renaissance were transmitted to England by Roger Ascham, George Gascoigne, Sir Philip Sidney, and others. Gascoigne's "Certayne notes of Instruction" (1575), the first English manual of versification, had a considerable effect on poetic practice in the Elizabethan Age. Sidney's *Defence of Poesie* (1595) vigorously argued the poet's superiority to the philosopher and the historian on the grounds that his imagination is chained neither to lifeless abstractions nor to dull actualities. The poet "doth not only show the way, but giveth so sweet a prospect into the way, as will entice any man to enter into it." While still honouring the traditional conception of poetry's role as bestowing pleasure and instruction, Sidney's essay presages the Romantic claim that the poetic mind is a law unto itself.

Neoclassicism and its decline. The Renaissance in general could be regarded as a neoclassical period, in that ancient works were considered the surest models for modern greatness. Neoclassicism, however, usually connotes narrower attitudes that are at once literary and social: a worldly-wise tempering of enthusiasm, a fondness for proved ways, a gentlemanly sense of propriety and balance. Criticism of the 17th and 18th centuries, particularly in France, was dominated by these Horatian norms. French critics such as Pierre Corneille and Nicolas Boileau urged a strict orthodoxy regarding the dramatic unities and the requirements of each distinct genre, as if to disregard them were to lapse into barbarity. The poet was not to imagine that his genius exempted him from the established laws of craftsmanship.

Neoclassicism had a lesser impact in England, partly because English Puritanism had kept alive some of the original Christian hostility to secular art, partly because English authors were on the whole closer to plebeian taste than were the court-oriented French, and partly because of the difficult example of Shakespeare, who magnificently broke all of the rules. Not even the relatively severe classicist Ben Jonson could bring himself to deny Shakespeare's greatness, and the theme of Shakespearean genius triumphing over formal imperfections is echoed by major British critics from John Dryden and Alexander Pope through Samuel Johnson. The science of Newton and the psychology of Locke also worked subtle changes on neoclassical themes. Pope's *Essay on Criticism* (1711) is a Horatian compendium of maxims, but Pope feels obliged

to defend the poetic rules as "Nature methodiz'd"—a portent of quite different literary inferences from Nature. Dr. Johnson, too, though he respected precedent, was above all a champion of moral sentiment and "mediocrity," the appeal to generally shared traits. His preference for forthright sincerity left him impatient with such intricate conventions as those of the pastoral elegy.

Progress of a cult of "feeling"

The decline of Neoclassicism is hardly surprising; literary theory had developed very little during two centuries of artistic, political, and scientific ferment. The 18th century's important new genre, the novel, drew most of its readers from a bourgeoisie that had little use for aristocratic dicta. A Longinian cult of "feeling" gradually made headway, in various European countries, against Neoclassical canons of proportion and moderation. Emphasis shifted from concern for meeting fixed criteria to the subjective state of the reader and then of the author himself. The spirit of nationalism entered criticism as a concern for the origins and growth of one's own native literature and as an esteem for such non-Aristotelian factors as "the spirit of the age." Historical consciousness produced by turns theories of literary progress and primitivistic theories affirming, as one critic put it, that "barbarous" times are the most favourable to the poetic spirit. The new recognition of strangeness and strong feeling as literary virtues yielded various fashions of taste for misty sublimity, graveyard sentiments, medievalism, Norse epics (and forgeries), Oriental tales, and the verse of plowboys. Perhaps the most eminent foes of Neoclassicism before the 19th century were Denis Diderot in France and, in Germany, Gotthold Lessing, Johann von Herder, Johann Wolfgang von Goethe, and Friedrich Schiller.

Romanticism. Romanticism, an amorphous movement that began in Germany and England at the turn of the 19th century, and somewhat later in France, Italy, and the United States, found spokesmen as diverse as Goethe and August and Friedrich von Schlegel in Germany, William Wordsworth and Samuel Taylor Coleridge in England, Madame de Staël and Victor Hugo in France, Alessandro Manzoni in Italy, and Ralph Waldo Emerson and Edgar Allan Poe in the United States. Romantics tended to regard the writing of poetry as a transcendentally important activity, closely related to the creative perception of meaning in the world. The poet was credited with the godlike power that Plato had feared in him; Transcendental philosophy was, indeed, a derivative of Plato's metaphysical Idealism. In the typical view of Percy Bysshe Shelley, poetry "strips the veil of familiarity from the world, and lays bare the naked and sleeping beauty, which is the spirit of its forms."

Wordsworth's preface to *Lyrical Ballads* (1800), with its definition of poetry as the spontaneous overflow of powerful feelings and its attack on Neoclassical diction, is regarded as the opening statement of English Romanticism. In England, however, only Coleridge in his *Biographia Literaria* (1817) embraced the whole complex of Romantic doctrines emanating from Germany; the British empiricist tradition was too firmly rooted to be totally washed aside by the new metaphysics. Most of those who were later called Romantics did share an emphasis on individual passion and inspiration, a taste for symbolism and historical awareness, and a conception of art works as internally whole structures in which feelings are dialectically merged with their contraries. Romantic criticism coincided with the emergence of aesthetics as a separate branch of philosophy, and both signalled a weakening in ethical demands upon literature. The lasting achievement of Romantic theory is its recognition that artistic creations are justified, not by their promotion of virtue, but by their own coherence and intensity.

The late 19th century. The Romantic movement had been spurred not only by German philosophy but also by the universalistic and utopian hopes that accompanied the French Revolution. Some of those hopes were thwarted by political reaction, while others were blunted by industrial capitalism and the accession to power of the class that had demanded general liberty. Advocates of the literary imagination now began to think of themselves as enemies or gadflies of the newly entrenched bourgeoisie. In some hands the idea of creative freedom dwindled to a bohemianism pitting "art for its own sake" against commerce and respectability. Aestheticism characterized both the Symbolist criticism of Charles Baudelaire in France and the self-conscious decadence of Algernon Swinburne, Walter Pater, and Oscar Wilde in England. At an opposite extreme, realistic and naturalistic views of literature as an exact record of social truth were developed by Vissarion Belinsky in Russia, Gustave Flaubert and Émile Zola in France, and William Dean Howells in the United States. Zola's program, however, was no less anti-bourgeois than that of the Symbolists; he wanted novels to document conditions so as to expose their injustice. Post-Romantic disillusion was epitomized in Britain in the criticism of Matthew Arnold, who thought of critical taste as a substitute for religion and for the unsatisfactory values embodied in every social class.

Toward the end of the 19th century, especially in Germany, England, and the United States, literary study became an academic discipline "at the doctoral level." Philology, linguistics, folklore study, and the textual principles that had been devised for biblical criticism provided curricular guidelines, while academic taste mirrored the prevailing impressionistic concern for the quality of the author's spirit. Several intellectual currents joined to make possible the writing of systematic and ambitious literary histories. Primitivism and Medievalism had awakened interest in neglected early texts; scientific Positivism encouraged a scrupulous regard for facts; and the German idea that each country's literature had sprung from a unique national consciousness provided a conceptual framework. The French critic Hippolyte Taine's *History of English Literature* (published in French, 1863–69) reflected the prevailing determinism of scientific thought; for him a work could be explained in terms of the race, milieu, and moment that produced it. For other critics of comparable stature, such as Charles Sainte-Beuve in France, Benedetto Croce in Italy, and George Saintsbury in England, historical learning only threw into relief the expressive uniqueness of each artistic temperament.

Merging intellectual currents

THE 20TH CENTURY

The ideal of objective research has continued to guide Anglo-American literary scholarship and criticism and has prompted work of unprecedented accuracy. Bibliographic procedures have been revolutionized; historical scholars, biographers, and historians of theory have placed criticism on a sounder basis of factuality. Important contributions to literary understanding have meanwhile been drawn from anthropology, linguistics, philosophy, and psychoanalysis. Impressionistic method has given way to systematic inquiry from which gratuitous assumptions are, if possible, excluded. Yet demands for a more ethically committed criticism have repeatedly been made, from the New Humanism of Paul Elmer More and Irving Babbitt in the United States in the 1920s, through the moralizing criticism of the Cambridge don F.R. Leavis and of the American poet Yvor Winters, to the most recent demands for "relevance."

No sharp line can be drawn between academic criticism and criticism produced by authors and men of letters. Many of the latter are now associated with universities, and the main shift of academic emphasis, from impressionism to formalism, originated outside the academy in the writings of Ezra Pound, T.S. Eliot, and T.E. Hulme, largely in London around 1910. Only subsequently did such academics as I.A. Richards and William Empson in England and John Crowe Ransom and Cleanth Brooks in the United States adapt the New Criticism to reform of the literary curriculum—in the 1940s. New Criticism has been the methodological counterpart to the strain of modernist literature characterized by allusive difficulty, paradox, and indifference or outright hostility to the democratic ethos. In certain respects the hegemony of New Criticism has been political as well as literary; and anti-Romantic insistence on irony, convention, and aesthetic distance has been accompanied by scorn for all revolutionary hopes. In Hulme conservatism and classicism were explicitly linked. Romanticism struck him as "spilt religion," a dangerous

exaggeration of human freedom. In reality, however, New Criticism owed much to Romantic theory, especially to Coleridge's idea of organic form, and some of its notable practitioners have been left of centre in their social thought.

Multiplicity and factionalism

The totality of Western criticism in the 20th century defies summary except in terms of its restless multiplicity and factionalism. Schools of literary practice, such as Imagism, Futurism, Dadaism, and Surrealism, have found no want of defenders and explicators. Ideological groupings, psychological dogmas, and philosophical trends have generated polemics and analysis, and literary materials have been taken as primary data by sociologists and historians. Literary creators themselves have continued to write illuminating commentary on their own principles and aims. In poetry, Paul Valéry, Ezra Pound, Wallace Stevens; in the theatre, George Bernard Shaw, Antonin Artaud, Bertolt Brecht; and in fiction, Marcel Proust, D.H. Lawrence, and Thomas Mann have contributed to criticism in the act of justifying their art.

Most of the issues debated in 20th-century criticism appear to be strictly empirical, even technical, in nature. By what means can the most precise and complete knowledge of a literary work be arrived at? Should its social and biographical context be studied or only the words themselves as an aesthetic structure? Should the author's avowed intention be trusted, or merely taken into account, or disregarded as irrelevant? How is conscious irony to be distinguished from mere ambivalence, or allusiveness from allegory? Which among many approaches—linguistic, generic, formal, sociological, psychoanalytic, and so forth—is best adapted to making full sense of a text? Would a synthesis of all these methods yield a total theory of literature? Such questions presuppose that literature is valuable and that objective knowledge of its workings is a desirable end. These assumptions are, indeed, so deeply buried in most critical discourse that they customarily remain hidden from critics themselves, who imagine that they are merely solving problems of intrinsic interest.

What separates modern criticism from earlier work is its catholicity of scope and method, its borrowing of procedures from the social scienes, and its unprecedented attention to detail. As literature's place in society has become more problematic and peripheral, and as humanistic education has grown into a virtual industry with a large group of professionals serving as one another's judges, criticism has evolved into a complex discipline, increasingly refined in its procedures but often lacking a sense of contact with the general social will. Major modern critics, to be sure, have not allowed their "close reading" to distract them from certain perennial questions about poetic truth, the nature of literary satisfaction, and literature's social utility, but even these matters have sometimes been cast in "value-free" empirical terms.

Science as the outstanding influence

Recourse to scientific authority and method, then, is the outstanding trait of 20th-century criticism. The sociology of Marx, Max Weber, and Karl Mannheim, the mythological investigations of Sir James George Frazer and his followers, Edmund Husserl's phenomenology, Claude Levi-Strauss's anthropological structuralism, and the psychological models proposed by Sigmund Freud and C.G. Jung have all found their way into criticism. The result has been not simply an abundance of technical terms and rules, but a widespread belief that literature's governing principles can be located outside literature. Jungian "archetypal" criticism, for example, regularly identifies literary power with the presence of certain themes that are alleged to inhabit the myths and beliefs of all cultures, while psychoanalytic exegetes interpret poems in exactly the manner that Freud interpreted dreams. Such procedures may encourage the critic, wisely or unwisely, to discount traditional boundaries between genres, national literatures, and levels of culture; the critical enterprise begins to seem continuous with a general study of man. The impetus toward universalism can be discerned even in those critics who are most skeptical of it, the so-called historical relativists who attempt to reconstruct each epoch's outlook and to understand works as they appeared to their first readers. Historical relativism does undermine cross-cultural notions of beauty, but it reduces the record of any given period to data from which inferences can be systematically drawn. Here, too, in other words, uniform methodology tends to replace the intuitive connoisseurship that formerly typified the critic's sense of his role.

The debate over poetic truth may illustrate how modern discussion is beholden to extraliterary knowledge. Critics have never ceased disputing whether literature depicts the world correctly, incorrectly, or not at all, and the dispute has often had more to do with the support or condemnation of specific authors than with ascertainable facts about mimesis. Today it may be almost impossible to take a stand regarding poetic truth without also coming to terms with positivism as a total epistemology. The spectacular achievements of physical science have (with logic questioned by some) downgraded intuition and placed a premium on concrete, testable statements very different from those found in poems. Some of the most influential modern critics, notably I.A. Richards in his early works, have accepted this value order and have confined themselves to behavioristic study of how literature stimulates the reader's feelings. A work of literature, for them, is no longer something that captures an external or internal reality, but is merely a locus for psychological operations; it can only be judged as eliciting or failing to elicit a desired response.

Literature as a form of knowing

Other critics, however, have renewed the Shelleyan and Coleridgean contention that literary experience involves a complex and profound form of knowing. In order to do so they have had to challenge Positivism in general. Such a challenge cannot be convincingly mounted within the province of criticism itself and must depend rather on the authority of antipositivist epistemologists such as Alfred North Whitehead, Ernst Cassirer, and Michael Polanyi. If it is now respectable to maintain, with Wallace Stevens and others, that the world is known through imaginative apprehensions of the sort that poetry celebrates and employs, this is attributable to developments far outside the normal competence of critics.

The pervasive influence of science is most apparent in modern criticism's passion for total explanation of the texts it brings under its microscope. Even formalist schools, which take for granted an author's freedom to shape his work according to the demands of art, treat individual lines of verse with a dogged minuteness that was previously unknown, hoping thereby to demonstrate the "organic" coherence of the poem. The spirit of explanation is also apparent in those schools that argue from the circumstances surrounding a work's origin to the work itself, leaving an implication that the former have caused the latter. The determinism is rarely as explicit or relentless as it was in Taine's scheme of race, milieu, and moment, but this may reflect the fact that causality in general is now handled with more sophistication than in Taine's day.

Whether criticism will continue to aim at empirical exactitude or will turn in some new direction cannot be readily predicted, for the empiricist ideal and its sanctuary, the university, are not themselves secure from attack. The history of criticism is one of oscillation between periods of relative advance, when the imaginative freedom of great writers prompts critics to extend their former conceptions, and periods when stringent moral and formal prescriptions are laid upon literature. In times of social upheaval criticism may more or less deliberately abandon the ideal of disinterested knowledge and be mobilized for a practical end. Revolutionary movements provide obvious instances of such redirection, whether or not they identify their pragmatic goals with the cause of science. It should be evident that the future of criticism depends on factors that lie outside criticism itself as a rationally evolving discipline. When a whole society shifts its attitudes toward pleasure, unorthodox behaviour, or the meaning of existence, criticism must follow along.

Literature as a source of order

As Matthew Arnold foresaw, the waning of religious certainty has encouraged critics to invest their faith in literature, taking it as the one remaining source of value and order. This development has stimulated critical activity, yet, paradoxically, it may also be responsible in part

for a growing impatience with criticism. What Arnold could not have anticipated is that the faith of some moderns would be apocalyptic and Dionysian rather than a sober and attenuated derivative of Victorian Christianity. Thought in the 20th century has yielded a strong undercurrent of anarchism which celebrates libidinous energy and self-expression at the expense of all social constraint, including that of literary form. In the critical writings of D.H. Lawrence, for example, fiction is cherished as an instrument of unconscious revelation and liberation. A widespread insistence upon prophetic and ecstatic power in literature seems at present to be undermining the complex, irony-minded formalism that has dominated modern discourse. As literary scholarship has acquired an ever-larger arsenal of weapons for attacking problems of meaning, it has met with increasing resentment from people who wish to be nourished by whatever is elemental and mysterious in literary experience.

An awareness of critical history suggests that the development is not altogether new, for criticism stands now approximately where it did in the later 18th century, when the Longinian spirit of expressiveness contested the sway of Boileau and Pope. To the extent that modern textual analysis has become what Hulme predicted, "a classical revival," it may not be welcomed by those who want a direct and intense rapport with literature. What is resisted now is not Neoclassical decorum but impersonal methodology, which is thought to deaden commitment. Such resistance may prove beneficial if it reminds critics that rationalized procedures are indeed no substitute for engagement. Excellent work continues to be written, not because a definitive method or synthesis of methods has been found, but on the contrary because the best critics still understand that criticism is an exercise of private sympathy, discrimination, and moral and cultural reflection.

(F.C.C.)

CHILDREN'S LITERATURE

Children's literature first clearly emerged as a distinct and independent form of literature in the second half of the 18th century, before which it had been at best only in an embryonic stage. During the 20th century, however, its growth has been so luxuriant as to make defensible its claim to be regarded with the respect—though perhaps not the solemnity—that is due any other recognized branch of literature.

DEFINITION OF TERMS

"Children." All potential or actual young literates, from the instant they can with joy leaf through a picture book or listen to a story read aloud, to the age of perhaps 14 or 15, may be called children. Thus "children" includes "young people." Two considerations blur the definition. Today's young teenager is an anomaly: his environment pushes him toward a precocious maturity. Thus, though he may read children's books, he also, and increasingly, reads adult books. Second, the child survives in many adults. As a result, some children's books (*e.g.*, Lewis Carroll's *Alice in Wonderland*, A.A. Milne's *Winnie-the-Pooh*, and, at one time, Munro Leaf's *Story of Ferdinand*) are also read widely by adults.

"Literature." In the term children's literature, the more important word is literature. For the most part, the adjective imaginative is to be felt as preceding it. It comprises that vast, expanding territory recognizably staked out for a junior audience, which does not mean that it is not also intended for seniors. Adults admittedly make up part of its population: children's books are written, selected for publication, sold, bought, reviewed, and often read aloud by grown-ups. Sometimes they seem also to be written with adults in mind, as for example the popular French *Astérix* series of comics parodying history. Nevertheless, by and large there *is* a sovereign republic of children's literature. To it may be added five colonies or dependencies: first, "appropriated" adult books satisfying two conditions—they must generally be read by children and they must have sharply affected the course of children's literature (Daniel Defoe's *Robinson Crusoe*, Jonathan Swift's *Gulliver's Travels*, the collection of folktales by the brothers Jacob and Wilhelm Grimm, the folk-verse anthology *Des Knaben Wunderhorn* ["The Boy's Magic Horn"], edited by Achim von Arnim and Clemens Brentano, and William Blake's *Songs of Innocence*); second, books the audiences of which seem not to have been clearly conceived by their creators (or their creators may have ignored, as irrelevant, such a consideration) but that are now fixed stars in the child's literary firmament (Mark Twain's *Adventures of Huckleberry Finn*, and Charles Perrault's fairy tales; third, picture books and easy-to-read stories commonly subsumed under the label of literature but qualifying as such only by relaxed standards (though Beatrix Potter and several other writers do nonetheless qualify); fourth, first quality children's versions of adult classics (Walter de la Mare's *Stories from the Bible*, perhaps Howard Pyle's retellings of the Robin Hood ballads and tales; finally, the domain of once oral "folk" material that children have kept alive—folktales and fairy tales; fables, sayings, riddles, charms, tongue twisters; folksongs, lullabies, hymns, carols, and other simple poetry; rhymes of the street, the playground, the nursery; and, supremely, *Mother Goose* and nonsense verse.

Categories often considered children's literature

Five categories that are often considered children's literature are excluded from this section. The broadest of the excluded categories is that of unblushingly commercial and harmlessly transient writing, including comic books, much of which, though it may please young readers, and often for good reasons, is for the purposes of this article notable only for its sociohistorical, rather than literary, importance. Second, all books of systematic instruction are barred except those sparse examples (*e.g.*, the work of John Amos Comenius) that illuminate the history of the subject. Third, excluded from discussion is much high literature that was not originally intended for children: from the past, Jean de La Fontaine's *Fables*, James Fenimore Cooper's Leatherstocking tales, Sir Walter Scott's *Ivanhoe*, Charlotte Brontë's *Jane Eyre*, Alexandre Dumas' *Three Musketeers*, Rudyard Kipling's *Kim*; from the modern period, Marjorie Kinnan Rawlings' *Yearling*, J.D. Salinger's *Catcher in the Rye*, *The Diary of Anne Frank*, Thor Heyerdahl's *Kon-Tiki*, Enid Bagnold's *National Velvet*. A fourth, rather minor, category comprises books about the young where the content but not the style or point of view is relevant (Sir James Barrie's *Sentimental Tommy*, William Golding's *Lord of the Flies*, F. Anstey's [Thomas Anstey Guthrie] *Vice Versa*). Finally, barred from central, though not all, consideration is the "nonfiction," or fact, book. Except for a handful of such books, the bright pages of which still rain influence or which possess artistic merit, this literature should be viewed from its socioeducational-commercial aspect.

THE CASE FOR A CHILDREN'S LITERATURE

Many otherwise comprehensive histories of literature slight or omit the child's reading interests. Many observers have made explicit the suspicion that children's literature, like that of detection or suspense, is "inferior." They cannot detect a sufficiently long "tradition"; distinguish an adequate number of master works; or find, to use on thoughtful critic's words, "style, sensibility, vision."

Others, holding a contrary view, assert that a tradition of two centuries is not to be ignored.

Though the case for a children's literature must primarily rest on its major writers (including a half dozen literary geniuses), it is based as well on other supports that bolster its claim to artistic stature.

Children's literature, while a tributary of the literary mainstream, offers its own identifiable, semidetached history. In part it is the issue of certain traceable social movements, of which the "discovery" of the child (see below) is the most salient. It is independent to the degree

that, while it must meet many of the standards of adult literature, it has also developed aesthetic criteria of its own by which it may be judged. According to some of its finest practitioners, it is independent, too, as the only existing literary medium enabling certain things to be said that would otherwise remain unsaid or unsayable. The nature of its audience sets it apart; it is often read, especially by children younger than 12, in a manner suggesting trance, distinct from that of adult reading. Universally diffused among literate peoples, it offers a rich array of genres, types, and themes, some resembling grown-up progenitors, many peculiar to itself. Its "style, sensibility, vision" range over a spectrum wide enough to span matter-of-fact realism and tenuous mysticism.

Scholarship and criticism

Other measures of its maturity include an extensive body (notably in Germany, Italy, Sweden, Japan, and the United States) of commentary, scholarship, criticism, history, biography, and bibliography, along with the beginnings of an aesthetic theory or philosophy of composition. Finally, one might note its power to engender its own institutions: publishing houses, theatres, libraries, itinerant storytellers, critics, periodicals, instruction in centres of higher learning, lectureships, associations and conferences, "book weeks," collections, exhibitions, and prizes. Indeed, the current institutionalizing of children's literature on an international scale has gone so far, some feel, as to cast a shadow on the spontaneity and lack of self-consciousness that should lie at its heart.

SOME GENERAL FEATURES AND FORCES

The discovery of the child. A self-aware literature flows from a recognition of its proper subject matter. The proper subject matter of children's literature, apart from informational or didactic works, is children. More broadly, it embraces the whole content of the child's imaginative world and that of his daily environment, as well as certain ideas and sentiments characteristic of it. The population of this world is made up not only of children themselves but of animated objects, plants, even grammatical and mathematical abstractions; toys, dolls, and puppets; real, chimerical, and invented animals; miniature or magnified humans; spirits or grotesques of wood, water, air, fire, and space; supernatural and fantasy creatures; figures of fairy tale, myth, and legend; imagined familiars and doppelgänger; and grown-ups as seen through the child's eyes—whether Napoleon, Dr. Dolittle, parents, or the corner grocer. That writers did not detect this lively cosmos for two and a half millennia is one of the curiosities of literature. At any moment there has always been a numerous, physically visible, and audible company of children. Whether this sizable minority, appraised as literary raw material, could be as rewarding as the adult majority was never asked.

And so, almost to the dawn of the Industrial Revolution, children's literature remained recessive. The chief, though not the only, reason is improbably simple: the child himself, though there, was not seen—not seen, that is, as a child.

In preliterate societies he was and is viewed in the light of his social, economic, and religious relationship to the tribe or clan. Though he may be nurtured in all tenderness, he is thought of not as himself but as a pre-adult, which is but one of his many forms. Among Old Testament Jews the child's place in society replicated his father's, molded by his relation to God. So, too, in ancient Greece and Rome the child, dressed in the modified adult costume that with appropriate changes of fashion remained his fate for centuries to come, was conceived as a miniature adult. His importance lay not in himself but in what Aristotle would have called his final cause: the potential citizen-warrior. A girl child was a seedbed of future citizen-warriors. Hence classical literature either does not see the child at all or misconstrues him. Astyanax and Ascanius, as well as Medea's two children, are not persons. They are stage props. Aristophanes scorns as unworthy of dramatic treatment the children in Euripides' *Alcestis*.

Throughout the Middle Ages and far into the late Renaissance the child remained, as it were, terra incognita. A sharp sense of generation gap—one of the motors of a children's literature—scarcely existed. The family, young and old, was a kind of homogenized mix. Sometimes children were even regarded as infrahuman: for Montaigne they had "neither mental activities nor recognizable body shape." The year 1658 is a turning point. In that year a Moravian educator, Comenius, published *Orbis Sensualium Pictus* (*The Visible World in Pictures*, 1659), a teaching device that was also the first picture book for children. It embodied a novel insight: children's reading should be of a special order because children are not scaled-down adults. But the conscious, systematic, and successful exploitation of this insight was to wait for almost a century.

Beginnings of children's literature

It is generally felt that, both as a person worthy of special regard and as an idea worthy of serious contemplation, the child began to come into his own in the second half of the 18th century. His emergence, as well as that of a literature suited to his needs, is linked to many historical forces, among them the development of Enlightenment thought (Rousseau and, before him, John Locke); the rise of the middle class; the beginnings of the emancipation of women (children's literature, unlike that for grown-ups, is in large measure a distaff product) and Romanticism, with its minor strands of the cult of the child (Wordsworth and others) and of genres making a special appeal to the young (folktales and fairy tales, myths, ballads). Yet, with all these forces working for the child, he still might not have emerged had it not been for a few unpredictable geniuses: William Blake, Edward Lear, Lewis Carroll, George MacDonald, Louisa May Alcott, Mark Twain, Collodi, Hans Christian Andersen. But, once tentatively envisaged as an independent being, a literature proper to him could also be envisaged. And so in the mid-18th century what may be defined as children's literature was at last developing.

Shifting visions of the child. Even after the child had been recognized, his literature on occasion persisted in viewing him as a diminutive adult. More characteristically, however, "realistic" (that is, nonfantastic) fiction in all countries regarded the discovered child in a mirror that provided only a partial reflection of him. There are fewer instances of attempts to present the child whole, in the round, than there are (as in Tolstoy or Joyce) attempts to represent the whole adult. Twain's Huck Finn, Erich Kästner's Emil (in *Emil and the Detectives*), Vadim Frolov's Sasha (in *What It's All About*), and Maria Gripe's delightful Josephine all exemplify in-the-round characterization. More frequently, however, children's literature portrays the young as types. Thus there is the brand of hell of the Puritan tradition; the moral child of Mrs. Trimmer; the well-instructed child of Madame de Genlis; the small upper class benefactor of Arnaud Berquin; the naughty child, modulated variously in Catherine Sinclair's *Holiday House* and in the books of Comtesse de Ségur, E. Nesbit, Dr. Heinrich Hoffmann (*Struwwelpeter*), and Wilhelm Busch (*Max und Moritz*); the rational child of Maria Edgeworth; the little prig of Thomas Day's *Sandford and Merton;* the little angel (Frances Hodgson Burnett's *Little Lord Fauntleroy*); the forlorn waif (Hector Malot's *Sans Famille*); the manly, outdoor child (Arthur Ransome's *Swallows and Amazons*); etc. The rationale behind these shifting visions of childhood is akin to Renaissance theories of "humours" or "the ruling passion." Progress in children's literature depended partly on abandoning this mechanical, part-for-the-whole attitude. One encouraging note in realistic children's fiction of the second half of the 20th century in all advanced countries is the appearance of a more organic view.

Slow development. A third universal feature: children's literature appears later than adult and grows more slowly. Only after the trail has been well blazed does it make use of new techniques, whether of composition or illustration. As for content, only after World War II did it exploit certain realistic themes and attitudes, turning on race, class, war, and sex, that had been part of general literature at least since the 1850s. This tardiness may be due to the child's natural conservatism.

Realistic themes and attitudes

Fourth, the tempo of development varies sharply from country to country and from region to region. It is plausible that England should create a complex children's literature, while a less-developed region (the Balkans, for

example) might not. Less clear is why the equally high cultures of France and England should be represented by unequal literatures.

The didactic versus the imaginative. The fifth, and most striking, general feature is the creative tension resulting from a constantly shifting balance between two forces: that of the pulpit-schoolroom and that of the imagination. The first force may take on many guises. It may stress received religious or moral doctrine, thus generating the Catholic children's literature of Spain or the moral tale of Georgian and early Victorian England. It may bear down less on morality than on mere good manners, propriety, or adjustment to the prevailing social code. It may emphasize nationalist or patriotic motives, as in Edmondo De Amicis' post-Risorgimento *Cuore* (*The Heart of a Child*) or much Soviet production. Or its concern may be pedagogical, the imparting of "useful" information, frequently sugarcoated in narrative or dialogue. Whatever its form, it is distinguishable from the shaping spirit of imagination, which ordinarily embodies itself in children's games and rhymes, the fairy tale, the fantasy, animal stories such as Kipling's *Jungle Books,* nonsense, nonmoral poetry, humour, or the realistic novel conceived as art rather than admonition.

Children's literature designed for entertainment rather than self-improvement, aiming at emotional expansion rather than acculturation, usually develops late. *Alice in Wonderland,* the first supreme victory of the imagination (except for *Mother Goose*), did not appear until 1865. Frequently the literature of delight has underground sources of nourishment and inspiration: oral tradition, nursery songs, and the folkish institutions of the chapbook and the penny romance.

While the didactic and the imaginative are conveniently thought of as polar, they need not always be inimical. *Little Women* and *Robinson Crusoe* are at once didactically moral and highly poetical. Nevertheless, many of the acknowledged classics in the field, from *Alice* to *The Hobbit,* incline to fantasy, which is less true of literature for grown-ups.

THE DEVELOPMENT OF CHILDREN'S LITERATURE

Criteria. Keeping these five general features of development in mind, certain criteria may now be suggested as helpful in making a gross estimate of the degree of that development within any given country. Some of these criteria are artistic. Others link with social progress, wealth, technological level, or the political structure. In what seems their order of importance, these criteria are:

1. Degree of awareness of the child's identity (see above).
2. Progress made beyond passive dependence on oral tradition, folklore, and legend.
3. Rise of a class of professional writers, as distinct from moral reformers, schoolteachers, clerics, or versatile journalists—all those who, for pedagogical, doctrinal, or pecuniary reasons turn themselves into writers for children. For example, a conscious Italian literature for young people may be said to have begun in 1776 with the Rev. Francesco Soave's moralistic "Short Stories," and largely because that literature continued to be composed largely by nonprofessionals, its record has been lacklustre. It took more than a century after the Rev. Francesco to produce a *Pinocchio.* And only in the 20th century, as typified by the outstanding work of a professional like Gianni Rodari (*e.g., Telephone Tales*), did children's literature in Italy seem to be getting into full stride.
4. Degree of independence from authoritarian controls: church, state, school system, a rigid family structure. Although this criterion might be rejected by historians of some nations, one must somehow try to explain why the Spanish, a great and imaginative people, took so long—indeed until 1952—to produce, in Sanchez-Silva, a children's writer of any notable talent.
5. Number of "classics" the influence of which transcends national boundaries.
6. Invention of new forms or genres and the exploitation of a variety of traditional ones.
7. Measure of dependence on translations.
8. Quantity of primary literature: that is, annual production of children's books and, more to the point, of good children's books.
9. Quantity of secondary literature: richness and scope of a body of scholarship, criticism, reviewing.
10. Level of institutional development: libraries, publishing houses, associations, etc.

To these criteria some might add a vigorous tradition of illustration. But that is arguable. While Beatrix Potter's words and pictures compose an indivisible unit, it is equally true that a country may produce a magnificent school of artists (Czechoslovakia's Jiří Trnka, Ota Janeček, and others) without developing a literature of matching depth and variety.

The criteria applied: three examples. *West versus East.* The first application of such standards reveals the expected: a gap separating the achievement of the Far East from that of the West. Some Eastern literatures (New Guinea) have not advanced beyond the stage of oral tradition. Others (India, the Philippines, Ceylon, Iran) have been handicapped by language problems. Professional children's writers are rarer than in the West: according to D.R. Kalia, former director of the Delhi Public Library, "No such class exists in Hindi." In Japan, authoritarian patterns—filial piety and ancestor worship—have operated as brakes, though far less since World War II. A low economic level and inadequate technology discourage, in such countries as Burma, Sri Lanka (Ceylon), and Thailand, the origination and distribution of indigenous writing. A towering roadblock is the tendency to imitate the children's books of the West.

It is true that this vast Eastern region, considered as a whole, has produced a number of works ranking as "classics." Most advanced is Japan. Its literature for children goes back at least to the late 19th century and by 1928 was established in its own right. Japan's "discovery" of the child seems to have been made directly after World War II. In Iwaya Sazanami, Japan has its Grimm; in Ogawa Minei, perhaps its Andersen; in the contemporary Ishii Momoko, a critic and creative writer of quality; in Takeyama Michio's *Harp of Burma* (available in English), a high-quality postwar controversial novel. But, though less markedly in Japan, the basic Oriental inspiration remains fixed in folklore (also, in China and Japan, in nursery songs and rhymes), and the didactic imperative continues to act as a hobble. By most criteria the development of Eastern (as compared with Western) children's literature still appears to be sparse and tentative. Japanese development

North versus south. In western Europe there is a sharp variation or unevenness, as between north and south, in the tempo of development. This basic feature was first pointed out by Paul Hazard, a French critic, in *Les Livres, les enfants et les hommes* (Eng. trans. by Marguerite Mitchell, *Books, Children and Men,* 1944; 4th ed., 1960): "In the matter of literature for children the North surpasses the South by a large margin." For Hazard, Spain had no children's literature; Italy, with its *Pinocchio* and *Cuore,* could point only to an isolated pair of works of note, and even France in order to strengthen its claims had to include northern Frenchmen: Erckmann-Chatrian, Jules Verne—and the classic Comtesse de Ségur came from Russia.

Hazard wrote in the 1920s. Since then the situation has improved, not only in his own country, but in Italy and in Portugal. Yet he is essentially correct: the south cannot match the richness of England, Scotland, Germany, and the Scandinavian countries. To reinforce his position, one might also adduce the United States, noting that the Mason–Dixon line is (though not in the field of general literature) a dividing line: the American South, even including the Uncle Remus stories, has supplied very little good children's reading. As for nursery literature, though analogous rhymes are found everywhere, especially in China, the English *Mother Goose* is unique in the claims made for it as a work of art.

Why is the north superior to the south? The first criterion of development may be illuminating. It simply restates Hazard's dictum: "For the Latins, children have never been anything but future men. The Nordics have understood better this truer truth, that men are only grown- Superiority of northern literature

up children." ("Adults are obsolete children," says the American children's author "Dr. Seuss.") Hazard does not mention other factors. Historically, the south has shown greater attachment to authoritarian controls. Also, up to recent times, it has depended heavily on reworked folklore as against free invention. Besides, there is the mysterious factor of climate: it could be true that children in Latin countries mature faster and are sooner ready for adult literature. In France a special intellectual tradition, that of Cartesian logic, tends to discourage a children's literature. Clear and distinct ideas, excellent in themselves, do not seem to feed the youthful imagination.

Latin America. Again applying the chosen criteria, familiar patterns are recognizable: unevenness, as compared with the United States; belatedness—in Argentina the *cuento infantil* is hardly detectable before 1900; and especially an unbalanced polarity, with didacticism decidedly the stronger magnet. The close connection of the church with the child's family and school life has encouraged a literature stressing piety, and this at a time when the West, at least in its northern latitudes, is concerned less with the salvation than with the imagination of the child. Fantasy emerged only in the 1930s, in Brazil and in Mexico, where a Spanish exile, Antoniorrobles (pen name of Antonio Robles), continued to develop his inventive vein. And realistic writing about the actual life of the young evolved even more deliberately, being generally marked by a patriotic note. Though understandable and wholesome, this did not seem to help the cause of the imagination.

Folklore has been vigorously exploited, often by scholars of high repute. It is largely influenced by the legendry of Spain. Cuba, however, has produced interesting Afro-American tales for children; Argentina offers some indigenous folk stories and tales of gaucho life; and Central America is rich in native traditional verse enjoyed by children.

Characteristics of Latin-American literature

Latin American literature in general displays a special characteristic, part of its Iberian heritage: a partiality for linguistic decoration, which is unpalatable to the relatively straightforward taste of the young reader. Also the Latin-American view of the child remains tinged with a sentimentality from which many European countries and the United States had by 1914 more or less freed themselves. Thus verse for children, a medium specially cultivated in Latin America, has run to the soft, the sweet, even the lachrymose rather than to the gay, the humorous, or the sanguine—moods more congenial to the child's sensibility. This is true even of the children's verse of the Nobel Prize-winning poet Gabriela Mistral. To these two weaknesses one must add a third: the practical difficulty involved in the fact that most families cannot afford books. The absence of a powerful middle class has had a retarding effect.

Children in Latin America often complain that the authors write not for them but for their parents. They are given *lectura* ("reading matter") rather than *literatura,* which is but to say that in Latin America the admonitory note, considered so useful by church, state, and parent, continues to be sounded.

In summary, and applying the criteria: some less advanced Latin-American countries can hardly be said to have a children's literature at all. Others have produced notable writers: Brazil's José Bento Monteiro Lobato, Argentina's Ana Maria Berry, Colombia's Rafael Pombo, Uruguay's Horacio Quiroga. Yet the quality gap separating Latin-American children's literature from that of its northern neighbour is still wide.

HISTORICAL SKETCHES OF THE MAJOR LITERATURES

England. *Overview.* The English have often confessed a certain reluctance to say good-bye to childhood. This curious national trait, baffling to their continental neighbours, may lie at the root of their supremacy in children's literature. Yet it remains a mystery.

But, if it cannot be accounted for, it can be summed up. From the critic's vantage point, the English (as well as the Scots and the Welsh) must be credited with having originated or triumphed in more children's genres than any other country. They have excelled in the school story, two solid centuries of it, from Sarah Fielding's *The Governess; or, The Little Female Academy* (1745) to, say, C. Day Lewis' *Otterbury Incident* (1948) and including such milestones as Thomas Hughes's *Tom Brown's School Days* (1857) and Kipling's *Stalky & Co.* (1899); and the boy's adventure story, with one undebatable world masterpiece in Stevenson's *Treasure Island* (1883), plus a solid line of talented practitioners, from the Victorian Robert Ballantyne (*The Coral Island*) to the contemporary Richard Church and Leon Garfield (*Devil-in-the-Fog*); the "girls' book," often trash but possessing in Charlotte M. Yonge at least one writer of exceptional vitality; historical fiction, from Marryat's vigorous but simple *Children of the New Forest* (1847) to the even more vigorous but burnished novels of Rosemary Sutcliff; the "vacation story," in which Arthur Ransome still remains unsurpassed; the doll story, from Margaret Gatty and Richard Henry Horne to the charming fancies of Rumer Godden and the remarkable serious development of this tiny genre in Pauline Clarke's *Return of the Twelves* (1962); the realism-cum-fantasy novel, for which E. Nesbit provided a classic, and P.L. Travers a modern, formulation; high fantasy (Lewis Carroll, George MacDonald, C.S. Lewis, Alan Garner); nonsense (Carroll again, Lear, Belloc); and nursery rhymes. In Jonathan Swift's *Gulliver's Travels* and Daniel Defoe's *Robinson Crusoe,* the English furnished two archetypal narratives that have bred progeny all over the world, and in Mary Norton's Tom-Thumb-and-Gulliver-born *The Borrowers* (1952) a work of art. In Leslie Brooke (*Johnny Crow's Garden*) and Beatrix Potter (*e.g., The Tale of Peter Rabbit*) they have two geniuses of children's literature (and illustration) for very small children—probably the most difficult of all the genres. In poetry they begin at the top with William Blake and continue with Christina Rossetti, Robert Louis Stevenson, Eleanor Farjeon, Walter de la Mare, A.A. Milne, and James Reeves. In the mutation of fantasy called whimsy, Milne (*Winnie-the-Pooh*) reappears as a master. In the important field of the animal story, Kipling, with his *Jungle Books* (1894, 1895) and *Just So Stories* (1902), remains unsurpassed. Finally the English have produced a number of unclassifiable masterpieces such as Kenneth Grahame's *Wind in the Willows* (which is surely more than an animal story) and several unclassifiable writers (Mayne and Lucy Boston, for example).

Genres of English children's literature

The social historian, surveying the same field from a different angle, would point out that the English were the first people in history to develop not only a self-conscious, independent children's literature but also the commercial institutions capable of supporting and furthering it. He would note the striking creative swing between didacticism and delight. He would detect the sources in ballads, chapbooks, nurses' rhymes, and street literature that have at critical moments prompted the imagination. What would perhaps interest him most is the way in which children's literature reflects, over more than two centuries, the child's constantly shifting position in society.

Prehistory (early Middle Ages to 1712). "Children's books did not stand out by themselves as a clear but subordinate branch of English literature until the middle of the 18th century." At least one critic has used "prehistorical" to designate all children's books published in England up to 1744, when John Newbery offered *A Little Pretty Pocket-Book.*

Before that, and as far back as the Middle Ages, children came in contact with schoolroom letters. There was the Anglo-Saxon theologian and historian the Venerable Bede, with his textbook on natural science, *De natura rerum.* There were the question-and-answer lesson books of the great English scholar Alcuin; the *Colloquy* of the English abbot Aelfric; the *Elucidariun* of the archbishop of Canterbury Anselm, often thought of as the first "encyclopaedia" for young people. Not until the mid-14th century was English (the genius of which somehow seems fitter than Latin for children's books) thought of as proper for literature. For his son "litel Lowis" Geoffrey Chaucer wrote in English the "Treatise on the Astrolabe" (1391). The English child was also afflicted, in the 15th and 16th centuries, by many "Books of Courtesy" (such as *The Babees Boke, c.* 1475), the ancestors of modern, equally ineffective manuals of conduct.

Along with these instructional works, there flourished, at least from the very early Renaissance, an unofficial or popular literature. It may not have been meant for children but—no one quite knows how—children managed to recognize it as their own. It included fables, especially those of Aesop; folk legends, such as those in the much read *Gesta Romanorum;* bestiaries, which, along with Aesop, may be ancestral to that flourishing children's genre, the animal story; romances, often clustering around King Arthur and Robin Hood; fairy tales, of which Jack the Giant Killer was the type; and nursery rhymes, probably largely orally transmitted. Perhaps the most influential underground literature consisted of the chapbooks, low-priced folded sheets containing ballads and romances (*Bevis of Southampton,* and *The Seven Champions of Christendom* [1597] were favourites), sold by wandering hawkers and peddlers. They fed the imagination of the poor, old and young, from Queen Anne's reign almost through Queen Victoria's. These native products of fancy were, in the early 18th century, reinforced by the first English translations of the classically simple French fairy tales of Charles Perrault and the more self-conscious ones of Madame D'Aulnoy.

Against this primitive literature of entertainment stands a primitive literature of didacticism stretching back to the early Middle Ages. This underwent a Puritan mutation after the Restoration. It is typified by that classic for the potentially damned child, *A Token for Children* (1671), by James Janeway. The Puritan outlook was elevated by Bunyan's *Pilgrim's Progress* (1678), which, often in simplified form, was either forced upon children or more probably actually enjoyed by them in lieu of anything better. Mrs. Overtheway (in Juliana Ewing's *Mrs. Overtheway's Remembrances,* 1869), recalling her childhood reading, refers to it as "that book of wondrous fascination." A softened Puritanism also reveals itself in Bunyan's *Book for Boys and Girls: or, Country Rhymes for Children* (1686), as well as the *Divine and Moral Songs for Children* by the hymn composer Isaac Watts, whose "How doth the little busy bee" still exhales a faint endearing charm.

Robinson Crusoe and *Gulliver's Travels*

The entire pre-1744 period is redeemed by two works of genius. Neither *Robinson Crusoe* nor *Gulliver's Travels* was meant for children. Immediately abridged and bowdlerized, they were seized upon by the prosperous young. The poorer ones, the great majority, had to wait for the beginning of the cheap reprint era. Both books fathered an immense progeny in the children's field. Defoe engendered a whole school of "Robinsonnades" in most European countries, the most famous example being Wyss's *Swiss Family Robinson* (1812–13).

On the whole, during the millennium separating Alcuin from Newbery, the child's mind was thought of, if at all, as something to be improved; his imagination as something to be shielded; his soul as something to be saved. And on the whole the child's mind, imagination, and soul resisted, persisted, and somehow, whether in a dog-eared penny history of *The Babes in the Wood* or the matchless chronicle of Gulliver among the Lilliputians, found its own nourishment.

From "T.W." to "Alice" (1712?–1865). Napoleon called the English a "nation of shopkeepers," and in England art may owe much to trade. Children's literature in England got its start from merchants such as Thomas Boreman, of whom little is known, and especially John Newbery, of whom a great deal more is known. Research has established that at least as early as 1730 Boreman began publishing for children (largely educational works) and that in 1742 he produced what sounds like a recreational story, *Cajanus, the Swedish Giant.* Beginnings of English children's literature might be dated from the first decade of the 18th century, when a tiny 12-page, undated book called *A Little Book for Little Children* by "T.W." appeared. It is instructional but, as the critic Percy Muir says, important as the earliest publication in English "to approach the problem from the point of view of the child rather than the adult." In sum, without detracting from the significance of Newbery, it may be said that he was merely the first great success in a field that had already undergone a certain amount of exploitation.

Newbery's publications

The elevation of the publisher-bookseller-editor Newbery (who also sold patent medicines) to the position of patron saint is an excusable piece of sentiment. Perhaps it originated with one of his back writers who doubled as a man of genius. In Chapter XVIII of *The Vicar of Wakefield* (1766), Oliver Goldsmith lauds his employer as "the philanthropic bookseller of St. Paul's Churchyard, who has written so many books for children, calling himself their friend, but who was the friend of all mankind." There is no reason to believe that Newbery was anything but an alert businessman who discovered and shrewdly exploited a new market: middle class children, or rather their parents. Nevertheless this was a creative act. In 1744 he published *A Little Pretty Pocket-Book.* Its ragbag of contents—pictures of children's games, jingles, fables, "an agreeable Letter to read from Jack the Giant Killer," plus a bonus in the form of "a Ball and a Pincushion"—are of interest only because, addressing itself single-mindedly to a child audience, it aimed primarily at diversion. Thus children's literature clearly emerged into the light of day.

The climate of Newbery's era was nevertheless more suited to a literature of didacticism than to one of diversion. John Locke's *Some Thoughts concerning Education* (1693) is often cited as an early Enlightenment emancipatory influence. But close inspection of this manual for the mental conditioning of gentlemen reveals a strong English stress on character building and practical learning. Locke thinks little of the natural youthful inclination to poetry: "It is seldom seen that anyone discovers mines of Gold or Silver in Parnassus." He does endorse, as a daring idea, the notion that a child should read for pleasure, and he recommends Aesop. But the decisive influence was not Locke's. It came from across the Channel with Rousseau's best-seller *Émile* (1762). What is positive in Rousseau—his recognition that the child should not be too soon forced into the straitjacket of adulthood—was more or less ignored. Other of his doctrines had a greater effect on children's literature. For all his talk of freedom, he provided his young Émile with an amiable tyrant for a teacher, severely restricting his reading to one book *Robinson Crusoe.* It was his didactic strain, exemplified in the moral French children's literature of Arnaud Berquin and Madame de Genlis, that attracted the English.

Influence of Rousseau on English children's literature

They took more easily to Rousseau's emphasis on virtuous conduct and instruction via "nature" than they did to his advocacy of the liberation of personality. Some writers, such as Thomas Day, with his long-lived *Sandford and Merton,* were avowedly Rousseauist. Others took from him what appealed to them. Sarah Kirby Trimmer, whose *Fabulous Histories* specialized in piety, opposed the presumably free-thinking Rousseau on religious grounds but was in other respects strongly influenced by him. The same is true of Anna Laetitia Barbauld, with her characteristically titled *Lessons for Children.* But Mary Martha Sherwood could hardly have sympathized with Rousseau's notion of the natural innocence of children; the author of *The History of the Fairchild Family* (1818–47) based her family chronicle on the proposition (which she later softened) that "all children are by nature evil." Of all the members of the flourishing Rousseauist or quasi-Rousseauist school of the moral tale, only one was a true writer. Maria Edgeworth may still be read.

Though the tone varies from Miss Edgeworth's often sympathetic feeling for children to Mrs. Sherwood's Savonarolan severities, one idea dominates: a special literature for the child must be manufactured in order to improve or reform him. The reigning mythology is that of reason, a mythology difficult to sell to the young.

Yet during the period from John Newbery's *Little Pretty Pocket-Book* to Lewis Carroll's *Alice in Wonderland,* children's literature also showed signs of antisolemnity. In verse there was first of all William Blake. His *Songs of Innocence* (1789) was not written for children, perhaps indeed not written for anyone. But its fresh, anti-restrictive sensibility, flowing from a deep love for the very young, decisively influenced all English verse for children. Yet the poetry the young really read or listened to at the opening of the 19th century was not Blake but *Original Poems for Infant Minds* (1804), by "Several Young Persons," in-

cluding Ann and Jane Taylor. The Taylor sisters, though adequately moral, struck a new note of sweetness, of humour, at any rate of nonpriggishness. Their "Twinkle, twinkle, little star," included in *Rhymes for the Nursery* (1806), has not only been memorized but actually liked by many generations of small children. No longer read, but in its way similarly revolutionary, was *The Butterfly's Ball and the Grasshopper's Feast* (1807), by William Roscoe, a learned member of Parliament and writer on statistics. The gay and fanciful nonsense of this rhymed satiric social skit enjoyed, despite the seeming dominance of the moral Barbaulds and Trimmers, a roaring success.

Lear's nonsense verse

Great nonsense verse, however, had to await the coming of a genius, Edward Lear, whose *Book of Nonsense* (1846) was partly the product of an emergent and not easily explainable Victorian feeling for levity and partly the issue of a fruitfully neurotic personality, finding relief for its frustrations in the noncontingent world of the absurd and the free laughter of children.

In prose may be noted, toward the end of the period under discussion, the dawn of romantic historical fiction, with Frederick Marryat's *Children of the New Forest* (1847), a story of the English Civil War; and of the manly open-air school novel, with Thomas Hughes's *Tom Brown's School Days* (1857). A prominent milestone in the career of the "realistic" children's family novel is *Holiday House* (1839), by Catherine Sinclair, in which at last there are children who are noisy, even naughty, yet not destined for purgatory. Though Miss Sinclair's book does conclude with a standard deathbed scene, the overall atmosphere is one of gaiety. The victories in the field of children's literature may seem small, but they can be decisive. It was a small, decisive victory to have introduced in *Holiday House* an Uncle David, whose parting admonition to his nieces and nephews is: "Now children! I have only one piece of serious, important advice to give you all, so attend to me!—Never crack nuts with your teeth!"

A similar note was struck by Henry (later Sir Henry) Cole with his *Home Treasury* series, featuring traditional fairy tales, ballads, and rhymes. The fairy tale then began to come into its own, perhaps as a natural reaction to the moral tale. John Ruskin's *King of the Golden River* (1851) and William Makepeace Thackeray's "fireside pantomime" *The Rose and the Ring* (1855) were signs of a changing climate, even though the Grimm-like directness of the first is partly neutralized by Ruskin's moralistic bent and the gaiety of the second is spoiled by a laborious, parodic slyness. More important than these fairy tales, however, was the aid supplied by continental allies: the English publication in 1823–26 of the Grimms' *Fairy Tales;* in 1846 of Andersen's utterly personal fairy tales and folktales; in the '40s and '50s of other importations from the country of fancy, notably Sir George Dasent's version of the stirring *Popular Tales from the Norse* (1859), collected by Peter Christen Asbjørnsen and J.E. Moe. Though the literature of improvement continued to maintain its vigour, England was readying itself for Lewis Carroll.

Coming of age (1865–1945). In 1863 there appeared *The Water-Babies* by Charles Kingsley. In this fascinating, yet repulsive, "Fairy Tale for a Land-Baby," an unctuous cleric and a fanciful poet, uneasily inhabiting one body, collaborated. *The Water-Babies* may stand as a rough symbol of the bumpy passage from the moral tale to a lighter, airier world. Only two years later that passage was achieved in a masterpiece by an Oxford mathematical don, the Reverend Charles Lutwidge Dodgson (Lewis Carroll). *Alice's Adventures in Wonderland* improved none, delighted all. It opened what from a limited perspective seems the Golden Age of English children's literature, a literature in fair part created by Scotsmen: George Macdonald, Andrew Lang, Robert Louis Stevenson, Kenneth Grahame, James Barrie.

The Golden Age in English children's literature

The age is characterized by a literary level decisively higher than that previously achieved; the creation of characters now permanent dwellers in the child's imagination (from Alice herself to Mary Poppins, and including Long John Silver, Mowgli, intelligent Mr. Toad, and—if Hugh Lofting, despite his American residence, be accepted as English—Dr. Dolittle); the exaltation of the imagination in the work of Carroll, Macdonald, Stevenson, E. Nesbit, Grahame, Barrie, Hudson, Lofting, Travers, and the early Tolkien (*The Hobbit* [1938]); the establishment of the art fairy tale (Jean Ingelow with *Mopsa the Fairy* [1869]; Dinah Maria Mulock Craik with *The Little Lame Prince* [1875]; Mrs. Ewing with *Old Fashioned Fairy Tales* [1882]; Barrie's *Peter Pan* [1904]; and the exquisite artifices of Oscar Wilde in *The Happy Prince, and Other Tales* [1888]); the transmutation and popularization, by Andrew Lang, Joseph Jacobs, and others, of traditional fairy tales from all sources; the development of a quasi-realistic school in the fiction of Charlotte M. Yonge (*Countess Kate*); Mrs. Ewing (*Jan of the Windmill*); and Mrs. Molesworth; and, furthering this trend, a growing literary population of real, or at least more real, children (by E. Nesbit and Ransome).

It is further characterized by the rapid evolution of a dozen now-basic genres, including the school story, the historical novel, the vacation story, the "group" or "gang" novel, the boy's adventure tale, the girl's domestic novel, the animal tale, the career novel (Noel Streatfeild's *Ballet Shoes,* 1936), the work of pure whimsy (A.A. Milne's *Winnie-the-Pooh,* 1926); the solution, a brilliant one by Beatrix Potter and a charming one by L. Leslie Brooke, of the problem of creating literature for pre-readers and beginning readers; and the growth of an impressive body of children's verse: the lyric delicacy of Christina Rossetti in *Sing-Song* (1872), the accurate reflection of the child's world in Stevenson's *Child's Garden of Verses,* the satirical nonsense of Hilaire Belloc in his *The Bad Child's Book of Beasts* (1896), the incantatory, other-worldly magic of Walter de la Mare with his *Songs of Childhood* (1902) and *Peacock Pie* (1913), the fertile gay invention of Eleanor Farjeon, and the irresistible charm of Milne in *When We Were Very Young* (1924).

Finally it is characterized by the dominance in children's fiction of middle and upper middle class mores; the appearance, in the late 1930s, with Eve Garnett's *The Family from One End Street,* of stories showing a sympathetic concern with the lives of slum children; the reflection, also in the 30s, of a serious interest, influenced by modern psychology, in the structure of the child's vision of the world; the rise, efflorescence, and decline of the children's magazine: *Boy's Own Magazine* (1855–74), *Good Words for the Young* (1867–77), *Aunt Judy's Magazine* (1866–85), and—famous for its outstanding contributors—*The Boy's Own Paper* (1879–1912); the beginning, with F.J.H. Darton and other scholars, of an important critical-historical literature; institutionalization, commercialization, standardization—the popularity, for example, of the "series"; and the dominating influence of the better English work on the reading taste of American, Continental, and Oriental children.

During these 80 years a vast amount of trash and treacle was produced. What will be remembered is the work of a few dozen creative writers who applied to literature for children standards as high as those ordinarily applied to mainstream literature.

Contemporary times. If the contemporary wood cannot be seen for the trees, it is in part because the number of trees has grown so great. The profusion of English, as of children's books in general, makes judgment difficult. Livelier merchandising techniques (the spread of children's bookshops, for example), the availability of cheap paperbacks, improved library services, serious and even distinguished reviewing—these are among the post-World War II institutional trends helping to place more books in the hands of more children. Slick transformation formulas facilitate the rebirth of books in other guises: radio, television, records, films, digests, cartoon versions. Such processes may also create new child audiences, but that these readers are undergoing a literary experience is open to doubt.

Post-World War II literature

Among the genres that fell in favour, the old moral tale, if not a corpse, surely became obsolescent but raised the question whether it was being replaced by a subtler form of didactic literature, preaching racial, class, and international understanding. The standard adventure story too

seemed to be dying out, though excellent examples, such as *The Cave* (U.S. title, *Five Boys in a Cave* [1950]), by Richard Church, continued to appear. The boy's school story suffered a similar fate, despite the remarkable work of William Mayne in *A Swarm in May* (1955). Children's vese by Ian Serraillier, Ted Hughes, James Reeves, and the later Eleanor Farjeon, excellent though it was, did not speak with the master tones of a de la Mare or the precise simplicity of a Stevenson. In science fiction one would have expected more of a boom; yet nothing appeared comparable to Jules Verne.

Conversely, there was a genuine boom in fact books: biographical series, manuals of all sorts, popularized history, junior encyclopaedias. Preschool and easy-to-read beginners' books, often magnificently produced, multiplied. So did specially prepared decoys for the reluctant reader. After the discovery of the child came that of the postchild: conscientiously composed teen-age and "young adult" novels were issued in quantity, though the quality still left something to be desired. A 19th-century phenomenon—experimentation in the juvenile field by those who normally write for grown-ups—took on a second life after World War II. Naomi Mitchison, Richard Church, P.H. Newby, Richard Graves, Eric Linklater, Norman Collins, Roy Fuller, C. Day Lewis, and Ian Fleming, with his headlong pop extravaganza *Chitty Chitty Bang Bang* (1964), come to mind.

Teenage novels

A post-World War II stress on building bridges of understanding was reflected both in an increase in translations and in the publication of books, whether fiction or nonfiction, dealing responsibly and unsentimentally with the sufferings of a war-wounded world. One example among many was Serraillier's *Silver Sword* (1958), recounting the trans-European adventures that befell four Polish children after the German occupation. *The Silver Sword* was a specialized instance of a general trend toward the interpretation for children of a postwar world of social incoherence, race and class conflict, urban poverty, and even mental pathology. Such novels as John Rowe Townsend's *Gumble's Yard* (1961); *Widdershins Crescent* (1965); *Pirate's Island* (1968); Eve Garnett's *Further Adventures of the Family from One End Street* (1956); and Leila Berg's *Box for Benny* (1958) represented a new realistic school, restrained in England, less so in the United States, but manifest in the children's literature of much of the world. It failed to produce a masterpiece, perhaps because the form of the realistic novel must be moderately distorted to make it suitable for children.

In two fields, however, English postwar children's literature set new records. These were the historical novel and that cloudy area comprising fantasy, freshly wrought myth, and indeed any fiction not rooted in the here and now.

Historical fiction for children

There was fair reason to consider Rosemary Sutcliff not only the finest writer of historical fiction for children but quite unconditionally among the best historical novelists using English. A sound scholar and beautiful stylist, she made few concessions to the presumably simple child's mind and enlarged junior historical fiction with a long series of powerful novels about England's remote past, especially that dim period stretching from pre-Roman times to the coming of Christianity. Among her best works are *The Eagle of the Ninth* (1954), *The Shield Ring* (1956), *The Silver Branch* (1957), *The Lantern Bearers* (1959), and especially *Warrior Scarlet* (1958).

Not as finished in style, but bolder in the interpretation of history in terms "reflecting the changed values of the age," was the pioneering Geoffrey Trease. He also produced excellent work in other juvenile fields. Typical of his highest energies is the exciting *Hills of Varna* (1948), a story of the Italian Renaissance in which Erasmus and the great printer Aldus Manutius figure prominently. Henry Treece, whose gifts were directed to depicting violent action and vigorous, barbaric characters, produced a memorable series of Viking novels of which *Swords from the North* (1967) is typical.

This new English school, stressing conscientious scholarship, realism, honesty, social awareness, and general disdain for mere swash and buckle, produced work that completely eclipsed the rusty tradition of Marryat and George Alfred Henty. Some of its foremost representatives were Cynthia Harnett, Serraillier, Barbara Leonie Picard, Ronald Welch (pseudonym of Ronald O. Felton), C. Walter Hodges, Hester Burton, Mary Ray, Naomi Mitchison, and K.M. Peyton, whose "Flambards" series is a kind of Edwardian historical family chronicle. Leon Garfield, though not working with historical characters, created strange picaresque tales that gave children a thrilling, often chilling insight into the 18th-century England of Smollett and Fielding.

In the realm of imagination England not only retained but enhanced its supremacy with such classics as *Tom's Midnight Garden* (1958), by Ann Philippa Pearce, a haunting, perfectly constructed story in which the present and Victoria's age blend into one. There is the equally haunting Green Knowe series, by Lucy M. Boston, the first of which, *The Children of Greene Knowe*, appeared when the author was 62. The impingement of a world of legend and ancient, unsleeping magic upon the real world is the basic theme of the remarkable novels of Alan Garner. Complex, melodramatic, stronger in action than in characterization, they appeal to imaginative, "literary" children. Garner's rather nightmarish narrative *The Owl Service* (1967) is perhaps the most subtle.

Novels of Tolkien and C.S. Lewis

Finally there is a trio of masters, each the architect of a complete secondary world. The vast Middle Earth trilogy *The Lord of the Rings* (1954–55), by the Anglo-Saxon and Middle English language scholar J.R.R. Tolkien, was not written with children in mind. But they have made it their own. It reworks many of the motives of traditional romance and fantasy, including the Quest, but is essentially a structure, conceivably but not inevitably allegorical, of sheer invention on a staggering scale. It is also a sociocultural phenomenon, selling 3,000,000 copies in nine languages and functioning, for a certain class of American teenagers, as a semisacred cult object.

Tolkien's fellow scholar, C.S. Lewis, created his own otherworld of Narnia. It is more derivative than Tolkien's (he owes something, for example, to Nesbit), more clearly Christian-allegorical, more carefully adapted to the tastes of children. Though uneven, the seven volumes of the cycle, published through the years 1950 to 1956, are exciting, often humorous, inventive, and, in the final scenes of *The Last Battle*, deeply moving.

The third of these classic secondary worlds is in a sense not a creation of fantasy. The four volumes (1952–61) about the Borrowers, with their brief pendant, *Poor Stainless* (1971), ask the reader to accept only a single impossibility, that in a quiet country house, under the grandfather clock, live the tiny Clock family: Pod, Homily, and their daughter Arrietty. All that follows from this premise is logical, precisely pictured, and carries absolute conviction. Many critics believe that this miniature world so lovingly, so patiently fashioned by Mary Norton will last as long as those located at the bottom of the rabbit hole and through the looking glass.

United States. *Overview.* Compared with England, the United States has fewer peaks. In *Huckleberry Finn*, of course, it possesses a world masterpiece matched in the children's literature of no other country. *Little Women*, revolutionary in its day, radiates a century later a special warmth and may still be the most beloved "family story" ever written. Though *The Wonderful Wizard of Oz* has been recklessly compared with *Alice*, it lacks Carroll's brilliance, subtlety, and humour. Nonetheless, its story and characters apparently carry, like *Pinocchio*, an enduring, near-universal appeal for children. To these older titles might be added *Stuart Little* (1945) and *Charlotte's Web* (1952), by E.B. White, two completely original works that appear to have become classics. To this brief list of high points few can be added, though, on the level just below the top, the United States bears comparison with England and therefore any other country.

American classics

The "law" of belated development applies in a special way. From Jamestown to the end of the Civil War, American children's literature virtually depended on currents in England. In the adult field Cooper and Washington Irving may stand for a true declaration of independence. But it was not until the 1860s and '70s, with Mary

Mapes Dodge's *Hans Brinker,* Louisa May Alcott's *Little Women,* Lucretia Hale's *Peterkin Papers,* Mark Twain's *Tom Sawyer,* and *St. Nicholas* magazine, that children's literature finally severed its attachment to the mother country. In the marketplace, however, a uniquely American note was sounded much earlier, the first of the Peter Parley series of Samuel Goodrich having appeared in 1827.

In certain important fields, the United States pioneered. These include everyday-life books for younger readers; the non-class-based small-town story such as *The Moffats* by Eleanor Estes; the Americanized fairy tale and folktale such as *Uncle Remus* (1880), not originally meant for children, and Carl Sandburg's *Rootabaga Stories* (1922); beginners' books such as Dr. Seuss's *The Cat in the Hat* (1957); and the "new realism." One might maintain that American children's literature, particularly that since World War II, is bolder, more experimental, more willing to try and fail, than England's. Moreover, it set new standards of institutionalization, "packaging," merchandising, and publicity, as well as mere production, especially of fact books and "subject series."

Prehistory (1646?–1865). The prehistoric annals are short and simple. Dominated by England, native creativity—to refer only to books with even the thinnest claim to literary quality—amounted to little. The Puritan view of the unredeemable child obtained almost into the era of Andrew Jackson. Jonathan Edwards put it neatly: unrepentant children were "young vipers and infinitely more hateful than vipers." More moderate notions also existed. Imported English ballads and tales, even a few "shockers," were enjoyed by the young vipers. But in general, from John Cotton's *Spiritual Milk for Boston Babes* (1646) through the Civil War, the admonitory and exemplary tract and the schoolmaster's pointer prevailed. Occasionally there is the cheerful note of non-improvement, as in Clement Moore's "Visit from St. Nicholas" (1823), sounding against the successful lesson-cum-moral tales of Peter Parley (Goodrich) and the didactic "Rollo" series of Jacob Abbott. The latter's *Franconia Stories* (1850–53), however, showing traces of Rousseau and Johann Pestalozzi, is the remote ancestor of those wholesome, humorous pictures of small-town child life in which American writers excelled after World War I. Affectionately based on the author's own memories, they occasionally reveal children rather than improvable miniatures of men.

The children's magazines of the early 19th century did their best to amuse as well as instruct the young. Sara Josepha Hale's "Mary Had a Little Lamb" appeared in *The Juvenile Miscellany* (1826–34). The atmosphere was further lightened by *Grandfather's Chair* (1841) and its sequels, retellings of stories from New England history by Nathaniel Hawthorne. These were followed in 1852–53 by his redactions, rather unacceptable today, of Greek legends in *The Wonder Book for Girls and Boys* and *Tanglewood Tales for Girls and Boys.* Hawthorne's death date (1864) coincided roughly with a qualified subsidence of the literature of the didactic.

Peaks and plateaus (1865–1940). During the period from the close of the Civil War to the turn of the century an Americanized white, Anglo-Saxon, Protestant, Victorian gentility dominated as the official, though not necessarily real, culture. At first glance such a climate hardly seems to favour the growth of a children's literature. But counterforces were at work: a vigorous upsurge of interest, influenced by European thinkers, in the education and nurture of children; the dying-out of the old Puritanism; and the accumulation of enough national history to stimulate the imagination. To these forces must be added the appearance in Louisa May Alcott of a minor genius and in Samuel Clemens (Mark Twain) of a major one.

Dominance of Victorian gentility

American materialism (and also its optimism) expressed itself in the success myth of Horatio Alger, while a softened didacticism, further modified by a mild talent for lively narrative, was reflected in the 116 novels of Oliver Optic (William Taylor Adams). But a quartet of books appearing from 1865 to 1880—heralded a happier day. These were Mary Mapes Dodge's *Hans Brinker, or the Silver Skates* (1865), which for all its Sunday-school tone, revealed to American children an interesting foreign culture and told a story that still has charm; Louisa May Alcott's *Little Women* (1868; vol. ii, 1869; and its March family sequels), which lives by virtue of the imaginative power that comes from childhood truly and vividly recalled; Lucretia Hale's *Peterkin Papers* (1880), just as funny today as a century ago, perfect nonsense produced in a non-nonsensical era; and Thomas Bailey Aldrich's *Story of a Bad Boy* (1870). This, it is often forgotten, preceded *Tom Sawyer* by seven years, offered a model for many later stories of small-town bad boys, and is a fair example of the second-class classic. But it took *Tom Sawyer* and *Huckleberry Finn* to change the course of American writing and give the first deeply felt vision of boyhood in juvenile literature.

To these names should be added Frank Stockton (whose *Ting-a-Ling Tales* [1870] showed the possibilities inherent in the invented fairy tale) and especially the writer-illustrator Howard Pyle. His reworkings of legend (*The Merry Adventures of Robin Hood,* 1883; the King Arthur stories, 1903–1910, and his novels of the Middle Ages [*Otto of the Silver Hand,* 1888; and *Men of Iron,* 1892]) exemplify perfectly the romantic feeling of his time, as does the picture of Shakespeare's England drawn by John Bennett in *Master Skylark* (1897).

Contributions of Howard Pyle

The sentimentality that is sometimes an unconscious compensatory gesture in a time of ruthless materialism expressed itself in the idyllic *Poems of Childhood* (1896), by Eugene Field, and the rural dialect *Rhymes of Childhood* (1891), by James Whitcomb Riley. These poems can hardly speak to the children of the second half of the 20th century. But it is not clear that the same is true of the equally sentimental novels of Frances Hodgson Burnett. It is easy to smile over *Little Lord Fauntleroy* (1886) or her later and superior novels, *A Little Princess* (1905) and *The Secret Garden* (1911). Back of the absurd sentimentality, however, lies an extraordinary narrative skill, as well as an ability to satisfy the perennial desire felt by children at a certain age for life to arrange itself as a fairy tale.

The development of a junior literature from 1865 to about 1920 is ascribable less to published books than to two remarkable children's magazines: *The Youth's Companion* (1827–1929, when it merged with *The American Boy*) and the relatively nondidactic *St. Nicholas* magazine (1873–1939), which exerted a powerful influence on its exclusively respectable child readers. (It is surely needless to point out that up to the 1960s children's literature has been by and for the middle class). These magazines published the best material they could get, from England as well as the United States. For all their gentility, standards, including that of illustration, were high. The contributors' names in many cases became part of the canon of world literature. To the children of the last quarter of the 19th and first quarter of the 20th century, the periodical delivery of these magazines presumably meant something that film and television cannot mean to today's children. The magazines were not "media." They were friends.

Development of a junior literature

Appropriately the new century opened with a novelty: a successful American fairy tale. *The Wonderful Wizard of Oz* (1900) is vulnerable to attacks on its prose style, incarnating mediocrity. But there is something in it, for all its doctrinaire moralism, that lends it permanent appeal: a prairie freshness, a joy in sheer invention, the simple, satisfying characterization of Dorothy and her three old, lovable companions. Several of the sequels—but only those bearing L. Frank Baum's name—are not greatly inferior.

The century underwent for the next two decades a rather baffling decline. Some institutional progress was made in library development, professional education, and the reviewing of children's books. Much useful work was also accomplished in the field of fairy-tale and folktale collections. But original literature did not flourish. There were Pyle and Mrs. Burnett and the topflight nonsense verses of Laura E. Richards, whose collected rhymes in *Tirra Lirra* (1932) will almost bear comparison with those of Edward Lear. Less memorable are the works of Lucy Fitch Perkins, Joseph Altsheler, Ralph Henry Barbour, Kate Douglas Wiggin, Eliza Orne White, and the two Burgesses—Thornton and Gelett. During these decades, de la Mare, Miss Potter, Kipling, Barrie, Grahame, and E. Nesbit were at work in England.

During the period between world wars new trails were blazed in nonfiction with van Loon's *Story of Mankind* and V.M. Hillyer's *Child's History of the World* (1922). The *Here and Now Story Book*, by Lucy Sprague Mitchell, published in the 1920s, was the first real example of the "direct experience" school of writing, but it is more properly part of the chronicle of pedagogy than of literature. The small child was far better served by a dozen talented writer-illustrators, such as Wanda Gág, with her classic *Millions of Cats* (1928) and other delightful books; and Ludwig Bemelmans, with *Madeline* (1939) and its sequels. Other distinguished names in the important and growing picture-book field were Marjorie Flack, Hardie Gramatky, James Daugherty, the d'Aulaires, and Virginia Lee Burton.

In the field of comic verse and pictures for children of almost all ages, Dr. Seuss (Theodore Geisel), starting with *And to Think That I Saw It on Mulberry Street* (1937), continued to lead, turning out so many books that one tended to take him for granted. His talent is of a very high order.

Literature of the 1920s and '30s

The 1920s and '30s produced many well-written historical novels, striking a new note of authority and realism, such as *Drums* (1925, transformed in 1928 into a boy's book with N.C. Wyeth's illustrations), by James Boyd, and *The Trumpeter of Kracow* (1928), by Eric Kelly. The "junior novel" came to the fore in the following decade, together with an increase in books about foreign lands, minority groups, and a boom in elaborate picture books. Children's verse was well served by such able practitioners as Dorothy Aldis and Rosemary and Stephen Vincent Benét, with their stirring, hearty ballad-like poems collected in *A Book of Americans* (1933). But the only verse comparable to that of Stevenson or de la Mare was the exquisite *Under the Tree* (1922), by the novelist Elizabeth Madox Roberts, a treasure that should never be forgotten.

At least three other writers produced work of high and entirely original quality. Two of them—Florence and Richard Atwater—worked as a pair. Their isolated effort, *Mr. Popper's Penguins* (1938), will last as a masterpiece of deadpan humour that few children or adults can resist. The third writer is Laura Ingalls Wilder. Her *Little House* books, nine in all, started in 1932 with *The Little House in the Big Woods*. The entire series, painting an unforgettable picture of pioneer life, is a masterpiece of sensitive recollection and clean, effortless prose.

Work of quality was contributed during these two lively decades by authors too numerous to list. Among the best of them are Will James, with his horse story *Smoky* (1926); Rachel Field, whose *Hitty* (1929) is one of the best doll stories in the language; Elizabeth Coatsworth, with her fine New England tale *Away Goes Sally* (1934); and the well-loved story of a New York tomboy in the 1890s, *Roller Skates* (1936), by the famous oral storyteller Ruth Sawyer.

Contemporary times. Since the 1930s the quality and weight of American children's literature were sharphy affected by the business of publishing, as well as by the social pressures to which children, like adults, were subjected. Intensified commercialization and broad-front expansion had some good effects and some bad ones as well.

For any book of interest to adults, publishers constructed a corresponding one scaled to child size. The practice of automatic miniaturization stimulated a pullulation of fact books—termed by an unsympathetic observer "the information trap"—marked by a flood of subject series and simplified technology. Paperbacks and cheap reprints of juvenile favourites enlarged the youthful reading public, just as the multiplication of translations widened its horizon. More science fiction was published, a field in which the stories of Robert Heinlein and *A Wrinkle in Time* (1962), by Madeleine L'Engle, stood out. An increase was also noticeable in books for the disadvantaged child and in work of increasingly high quality by and for blacks. In the early 1950s, children's book clubs flourished, though they appeared to be on the wane little more than a decade later. Simple narration using "scientifically determined vocabulary" also seemed to decrease in popularity. There was a marked tendency to orient titles, fiction and nonfiction, to the requirements of the school curriculum. Another trend was toward collaborative "international" publishing. This had the double effect of cutting colour-plate costs and promoting blandness, since it was important that no country's readers be offended or surprised by anything in text or illustration. Still another alteration took place in the conventional notion of age and grade levels. Teenagers reached out for adult books; younger children read junior novels.

Growth of "realist" fiction

The most striking development was the growth of the "realists," most of them as earnest as Maria Edgeworth, a few of them lighter fingered, with a fringe of far-outers. The latter were fairly represented by Nat Hentoff in *Jazz Country* (1965), for example, and Maria Wojciechowska in *The Rotten Years* (1971). Teenage fiction as well as nonfiction dealt mercilessly with ethnic exploitation, poverty, broken homes, desertion, unemployment, adult hypocrisy, drug addiction, sex (including homosexuality), and death. A whole new "problem" literature became available, with no sure proof that it was warmly welcomed. The aesthetic dilemmas posed by this literature are still to be faced and resolved. The new social realist story often had the look of an updated moral tale: the dire consequences of nondiligence were replaced by those of pot smoking.

Nevertheless such original works as *Harriet the Spy* (1964) and *The Long Secret* (1965), by Louise Fitzhugh, showed how a writer adequately equipped with humour and understanding could incorporate into books for 11-year-olds subjects—even menstruation—ordinarily reserved for adult fiction. Similarly trailblazing were the semidocumentary novels of Joseph Krumgold: . . . *And Now Miguel* (1953), *Onion John* (1958), and *Henry 3* (1967), the last about a boy with an I.Q. of 154 trying to get along in a society antagonistic to brains. The candid suburban studies of E.L. Konigsburg introduced a new sophistication. Her 1968 Newbery Medal winner, *From the Mixed-Up Files of Mrs. Basil E. Frankweiler*, was original in its tone and humour.

As for the more traditional genres, a cheering number of high-quality titles rose above the plain of mediocrity. The nonfantastic animal story *Lassie Come Home* (1940), by Eric Knight, survived adaptation to film and television. In the convention of the talking animal, authentic work was produced by Ben Lucien Burman, with his wonderful "Catfish Bend" tales (1952–67). The American-style, wholesome, humorous family story was more than competently developed by Eleanor Estes, with her "Moffat" series (1941–43) and *Ginger Pye* (1951); Elizabeth Enright, with her Melendy family (1941–44); and Robert McCloskey, with *Homer Price* (1943)—to name only three unfailingly popular writers. Text-and-picture books for the very young posed an obdurate challenge: to create literature out of absolutely simple materials. That challenge, first successfully met by Beatrix Potter, attracted Americans. The modern period produced many enchanting examples of this tricky genre: *The Happy Lion* (1954) and its sequels, the joint work of the writer Louise Fatio and her artist husband, Roger Duvoisin; the "Little Bear" books, words by Else Holmelund Minarik, pictures by Maurice Sendak; and several zany tours de force by Dr. Seuss, including his one-syllable revolution *The Cat in the Hat* (1957). The picture books of Sendak, perhaps one of the few original geniuses in his restricted field, were assailed by many adults as frightening or abnormal. The children did not seem to mind.

Fiction about foreign lands

Fiction about foreign lands boasted at least one modern American master in Meindert De Jong, whose most sensitive work was drawn from recollections of his Dutch early childhood. A Hans Christian Andersen and Newbery winner, he is best savoured in *The Wheel on the School* (1954), and especially in the intuitive *Journey from Peppermint Street* (1968). The historical novel fared less well in America than in England. *Johnny Tremain* (1943), by Esther Forbes, a beautifully written, richly detailed story of the Revolution, stood out as one of the few high points, as did *The Innocent Wayfaring* (1943), a tale of Chaucer's England by the equally scholarly Marchette Chute. Poetry for children had at least two talented representatives. One was the eminent poet-critic John Ciardi, the other

David McCord, a veteran maker of nonsense and acrobat of language.

In fantasy, the farcical note was struck with agreeable preposterousness by Oliver Butterworth in *The Enormous Egg* (1956) and *The Trouble with Jenny's Ear* (1960). The prolific writer-illustrator William Pène Du Bois has given children nothing more uproariously delightful than *The Twenty-one Balloons* (1947), merging some of the appeals of Jules Verne with those of Samuel Butler's *Erewhon* and adding a sly humour all his own. Two renowned *New Yorker* writers, James Thurber and E.B. White, developed into successful fantasists, Thurber with an elaborate series of ambiguous literary fairy tales such as *The Thirteen Clocks*, White with his pair of animal stories *Stuart Little* and *Charlotte's Web* that for their humanity and uninsistent humour stand alone. The vein of "high fantasy" of the more traditional variety, involving magic and the construction of a legendary secondary world, was represented by the five highly praised volumes of the Prydain cycle (1964–68) by Newbery Medal winner Lloyd Alexander.

Two other works of pure imagination gave the 1960s some claim to special notice. The first was *The Phantom Tollbooth* (1961) by Norton Juster, a fantasy about a boy "who didn't know what to do with himself." Not entirely unjustly, it has been compared to *Alice*. The second received less attention but is more remarkable: *The Mouse and His Child* (1969), by Russell Hoban, who had been a successful writer of gentle tales for small children. But here was a different affair altogether: a flawlessly written, densely plotted story with quiet philosophical overtones. It involved a clockwork mouse, his attached son, and an unforgettable assortment of terribly real, humanized animals. Like *Alice* and *The Borrowers* —indeed like all major children's literature—it offered as much to the grown-up as to the young reader. With this moving, intellectually demanding fantasy the decade ended on a satisfactory note.

Germany and Austria. A. Merget's *Geschichte der deutschen Jugendliteratur* ("History of German Children's Literature") appeared in 1867, some years before the Germans had much children's literature to consider, a demonstration of Teutonic thoroughness. By two criteria—degree of awareness of the child's identity and level of institutional development—Germany leads the world. It has built a vast structure of history, criticism, analysis, and controversy devoted to a subject the chief property of which would appear to be its charm rather than its obscurity. One estimate has it that in West Germany alone there are over 300 associations dedicated to the study and promotion of children's literature. Such conscientiousness, nowhere else matched, such a serious desire to relate the child's reading to his nurture, education, and *Weltanschauung*, has an admirable aspect. But by attaching juvenile books too closely to the theory and demands of pedagogy, it may have constricted a marked native genius.

Historical influences

The dominant historical influences roughly coincide with those that have affected German mainstream literature, though, as expected, they were exerted more slowly. The Reformation, stressing the Bible, the catechism, and the hymnbook, bent the literature of childhood toward the didactic, the monitory, and the pious. The Enlightenment, however, did something to help toward the identification of the child as an independent being. With this insight are associated the educational theories of J.B. Basedow, J.F. Herbart, and Friedrich Froebel. One fruit of the movement was *Robinson der Jüngere* (1779; "The Young Robinson"), by Joachim Heinrich Campe, who adapted Defoe along Rousseauist lines, his eye sharply fixed on what he considered to be the natural interests of the child. Interchapters of useful moral conversations between the author and his pupils were a feature of the book. Campe's widespread activities on behalf of children, though less commercially motivated, recall Newbery's.

Rationalism, piety, and the German partiality for disciplined conduct were modified by the influence of two crucial works, not intended for children but soon taken over by them. Both are part of the Romantic movement that swept Germany and much of the Continent during the early 19th century. *Des Knaben Wunderhorn* (1805–08; "The Youth's Magic Horn"), a collection of old German songs and folk verse, included many children's songs, or songs that were so denominated by the editors, Achim von Arnim and Clemens Brentano. The effect of the book was to retrieve for Germany much of its rich folk heritage, to promote a new emotional sensibility, and to draw attention to the link, as the Romantics thought, binding folk feeling to the child's vision of the world. *Des Knaben Wunderhorn* became a part of German childhood, as La Fontaine's *Fables* in France and *Mother Goose* in England had become a part of growing up in those countries. It helped inspire several excellent writers of verse for children: A.H. Hoffmann von Fallersleben; August Kopisch; the writer-illustrator Count Franz Pocci, the first German to write nonsense verse for the young; F.W. Güll; and later poets such as Paula and Richard Dehmel.

German fairy tales

Just as *Des Knaben Wunderhorn* became a source of poetry, so the epochal folktale collection of the brothers Grimm helped to develop a school of prose fairy-tale writers. Not all of these Romantics wrote with children in mind. But some of the simplest of their tales have become part of the German child's inheritance. In today's presumably practical era, they are once more in favour. Among these masters of the "art" *Märchen* are E.T.A. Hoffmann; C.M. Brentano; Ludwig Tieck; de la Motte Fouqué, author of *Undine;* and Wilhelm Hauff, whose talents are most nearly adapted to the tastes of children.

Two curious half-geniuses of comic verse and illustration wrote and drew for the hitherto neglected small child. *Struwwelpeter* ("Shock-headed Peter"), by the premature surrealist Heinrich Hoffmann, aroused cries of glee in children across the continent. Wilhelm Busch created the slapstick buffoonery of Max and Moritz, the ancestors of the Katzenjammer Kids and indeed of many aspects of the comic strip.

The second half of the 19th century saw an increase in commercialized sentimentality and sensation and a corresponding decline in quality. The bogus Indian and Wild West tales of Karl May stand out luridly in the history of German children's literature. Up to about 1940, 7,500,000 of his books had been sold to German readers alone. (Emilio Salgari in Italy, G.A. Henty in England, and "Ned Buntline" in the United States, who were contemporaneously satisfying the same hunger for the suspenseful, did not approach's May's talent for fabrication without the slightest root in reality.)

It may have been May and others like him who roused an educator, Heinrich Wolgast, to publish in 1896 his explosive *Das Elend unserer Jugendliteratur* ("The Sad State of Our Children's Literature"). The event was an important one. It advanced for the first time the express thesis that "Creative children's literature must be a work of art"; Wolgast resolutely decried nationalistic and didactic deformations. He precipitated a controversy the echoes of which are still audible. On the whole his somewhat excessive zeal had a wholesome effect.

Two post-Wolgast poets of childhood worthy of mention are Christian Morgenstern, whose macabre, pre-Dada poetry for adults later came into vogue, and the lesser-gifted Joachim Ringelnatz. The nondidactic note they sounded in modern times was strengthened by a whole school of children's poets. No other country produced work in this difficult field superior to the finest verse of the multitalented James Krüss, and especially Josef Guggenmos, whose lyric simplicity at times recalls Blake. Guggenmos also has to his credit a translation of *A Child's Garden of Verses*, in itself an original work of art.

Between the world wars, prose showed few high points and, after the advent of Hitler, many low ones. *Der Kampf der Tertia* (1927; "The Third-Form Struggle"), by Wilhelm Speyer, was Germany's excellent contribution to the genre of the school story. Erich Kästner's *Emil and the Detectives* (1929) ranked not only as a work of art, presenting city boys with humour and sympathy, but as an immediate classic in an entirely new field, the juvenile detective story (Mark Twain's awkward *Tom Sawyer, Detective* [1896] may be ignored). Kästner, the dean of German writers for children, won an international audience with a long series of stories of which the thesis-fable *Die Konferenz der Tiere* (1949; Eng. trans. *The Animals'*

Conference, 1949) is perhaps the funniest as well as the most serious.

Post-World War II literature

Post-World War II literature, recovering from the Nazi blight, was strong in several fields. In realistic fantasy there is *Vevi* (1955), by the Austrian Erica Lillegg, an extraordinary tale of split personality, odd, exciting, even profound. Michael Ende's *Jim Knopf und Lucas der Lokomotivführer* (1961; Eng. trans., *Jim Button and Luke the Engine Driver,* 1963) has more than a touch of *Oz;* and both Kästner and Krüss have made agreeable additions to the realm of fantasy.

In the domain of the historical novel, Hans Baumann is a distinguished name. Lacking the narrative craft of Miss Sutcliff, whose story lines are always clean and clear, he matched her as a scholar and mounted scenes of great intensity in such novels as *Die Barke der Brüder* (1956; Eng. trans., *The Barque of the Brothers,* 1958) and especially *Steppensöhne* (1954; Eng. trans., *Sons of the Steppe,* 1958), a tale about two grandsons of Genghis Khan. His narrative history of some exciting archaeological discoveries, *Die Höhlen der grossen Jäger* (1953; Eng. trans., *The Caves of the Great Hunters,* 1954; rev. ed., 1962), is a minor classic. Mention should be made of Fritz Mühlenweg, a veteran of the Sven Hedin expedition of 1928–32 to Inner Mongolia and the author of *Grosser-Tiger und Kompass-Berg* (1950; Eng. trans., *Big Tiger and Christian,* 1952). A long, richly coloured narrative of a journey made by two boys, Chinese and European, through the Gobi Desert, it should stand as one of the finest adventure stories of the postwar years.

One general conclusion regarding West German children's literature after 1945 was that the native genius, which had been impeded by pedagogical theory and nationalist dogma, again appeared to be in free flow.

In East Germany, production was conditioned by the association with the Soviet Union, and it appeared to be recapitulating the developments in children's literature that had occurred in the Soviet Union after 1917. Socialist Realism was the basic food offered to the literary appetites of young East Germans.

Scandinavia. *Sweden.* Scandinavia, but especially Sweden, inevitably suggests a question as to why a group of small, sparsely populated countries ranks directly after England and the United States for the variety, vigour, and even genius of its children's literature. Hazard's north–south theory describes; it does not explain. A few possible factors may be listed: the inspiration of the master Andersen—yet he does not seem greatly to have inspired his homeland; the appearance in 1900 of the Swedish Ellen Key's two-volume *Barnets århundrede* (Eng. trans., *The Century of the Child,* 1909), pivotal in the history of the discovery that children really exist; a general modern atmosphere of social enlightenment; welfare statism tempered by regard for the individual; a school and library system, notably in Sweden, of extraordinary humanity and efficiency; perhaps even the long, lively career of the Stockholm Children's Theatre, a centre of creative activity. Yet the mystery persists. Since the first half of the 19th century, Scandinavia produced Andersen, Zacharias Topelius, Jorgen Moe, Henrik Wergeland, Helena Nyblom, Selma Lagerlöf, Elsa Beskow, Astrid Lindgren, Tove Jansson, Maria Gripe, Anna Lisa Warnlöf, Lennart Hellsing, Karin Anckarsvärd, Inger Sandberg, plus a school of critics and historians second only to that of Germany, plus many talented illustrators.

Children's literature in Sweden for centuries reflected that of Germany, of which Sweden was a cultural province during the Reformation and even through the Enlightenment period. The historian Göte Klingberg traced some kind of religious-instructive reading for children back to 1600. There is a record, though the manuscripts have vanished, of children's plays produced at the country manors during the 1700s and into the following century. The tradition of children's theatre has always been stronger in Sweden than elsewhere in Europe.

True Swedish national literature

A true native literature is usually dated from 1751-53, when the tutor Count Carl Tessin wrote his "Old Man's Letters to a Young Prince" (Gustav III), in which instruction was tempered by the first fairy tales written for Swedish children. The German influence, however, persisted until about the middle of the 19th century, when Fredrika Bremer, traveller and feminist, tried to stimulate the work of indigenous children's writers. The dominant influence of the Finnish-born but basically Swedish Topelius, of Hans Christian Andersen, and of the romantic spirit in general was felt at this time. Later in the century two followers of Andersen—Helena Nyblom and Anna Wahlenberg—enriched the tradition of the fairy tale. The former's *Sagokrans* (1903; Eng. trans., *The Witch of the Woods,* 1968), preserves a rare charm.

The great landmark, however, is Miss Lagerlöf's world classic *Nils Holgerssons underbara resa genom Sverige,* 2 vol. (1906–07; Eng. trans., *The Wonderful Adventures of Nils,* 1907; *Further Adventures of Nils,* 1911). Written (at the request of the state ministry of education) as a school geography, it is the rare example of an officially commissioned book that turned out to be a work of art. *Nils,* for all its burden of instruction, is a fantasy. At the same time, a realistic breakthrough was achieved by Laura Fitinghoff, whose historical novel about the famine of the 1860s, *Barnen från Frostmofjället* (1907; Eng. trans., *Children of the Moor,* 1927), ranks as a classic.

According to the historian Eva von Zweigbergk, didacticism ("diligence, obedience, and moderation") obtained up to the 1920s, though she also views the period 1890–1915 as Sweden's Golden Age. It included not only *Nils* but the emergence of a school of creators of picture books for small children headed by Elsa Beskow, whose work in pictures and text, extending over the years from 1897 to 1952, was decisive in its influence. This pre-modern period also saw many good writers for grown-ups devoting their talents to juvenile fiction. The sailing story *Mälarpirater* (1911; "The Pirates of Lake Mälaren"), by the novelist Sigfrid Siwertz, is a still-remembered example.

The period from 1940 on has called forth a bewildering array of talented writers and artist-writers. In the field of humour and nonsense there are Åke Holmberg, with his parodic Ture Sventon detective series; the outstanding poet Lennart Hellsing, with *Daniel Doppsko* (1959); Astrid Lindgren, successful in a half dozen genres but perhaps best known as the creator of the supergirl Pippi Longstocking; Gösta Knutsson, with her well-liked *Pelle svanslös* (1939; Eng. trans., *The Adventures of the Cat Who Had No Tail*). The psychological realistic novel, delving deeply into the inner lives of children, has been developed by Maria Gripe, whose *Hugo and Josephine* trilogy may become classic; Gunnel Linde's *Tacka vet jag Skorstensgränd* (1959; Eng. trans., *Chimney-Top Lane,* 1965); and Anna Lisa Warnlöf, writing under the pseudonym of "Claque," whose two series about Pella and Fredrika show an intuitive understanding of lonely and misunderstood children.

Harry Kullman and Martha Sandwall-Bergström are among the few Swedish writers who have used working class industrial backgrounds successfully. Kullman is also a historical novelist. The prolific Edith Unnerstad has written charming family stories, with a touch of fantasy, as has Karin Anckarsvärd, whose *Doktorns pojk'* (1963; Eng. trans., *Doctor's Boy,* 1965) is a quietly moving tale of small-town life in the horse-and-buggy days. The Sandbergs, Inger and Lasse, have advanced the Beskow tradition in a series of lovely picture books. Fantasy has been well served by Lindgren, Edith Unnerstad, Holmberg, Hellsing, and others. Children's poetry is a lively contemporary art, one distinguished poet being Britt G. Hallqvist.

By most criteria of development the Swedes rank high among those creating a children's literature that is both broad and deep.

Norway. Norway cannot boast a genius of worldwide fame. But, beginning with the 1830s when a new literary language, based on spoken Norwegian, was forged, Norway has possessed an identifiable children's literature. From 1837 to 1844 Asbjørnsen and Moe, the Grimms of Norway, published their remarkable collection of folk stories, and thus created not only a literary base on which the future could build but a needed sense of national identity. Moe also wrote specifically for children. His poems are part of Norwegian childhood, and his nature fantasy *I bronden*

og i tjernet ("In the Well and the Lake," 1851) made Viggo and his little sister Beate familiar for more than a century. Equally enduring are the fairy tales and children's verse of Norway's greatest poet Henrik Wergeland.

Golden Age of Norwegian literature

The Norwegian critic Jo Tenfjord believes that the 30 years from 1890 to 1920 represented a golden age. With this period are associated Dikken Zwilgmeyer, author of the "Inger Johanne" series about a small-town little girl; Barbra Ring, creator of the popular "Peik" stories and of a play *The Princess and the Fiddler,* which was produced yearly at the National Theatre in Oslo; Gabriel Scott; and the fairy-tale writer Johan Falkberget.

Among the more prominent and well-loved moderns are Halvor Floden, whose most famous work, centred on a gypsy waif, is *Gjenta fra lands vegen* ("The Girl from the Road"); the nonsense versifier Zinken Hopp; the poet Jan-Magnus Bruheim, three of whose collections have won state prizes; Finn Havrevold, whose toughminded boys' teenage novel *Han Var Min Ven* became available in English translation as *Undertow* in 1968, and who also wrote successfully for girls; Leif Hamre, specializing in air force adventures; the prolific, widely translated Aimée Sommerfelt, whose works range from "puberty novels" to faraway stories set in Mexico City and northern India; Thorbjørn Egner, who is the author of, among other books, a tiny droll fantasy, *Karius and Baktus* (1958; Eng. trans. 1962), which will actually persuade small children to brush their teeth; and Alf Prøysen, creator of Mrs. Pepperpot, a delightful little old lady who never knows when she is going to shrink to pepperpot size. Fantasy of this kind seems less characteristic of contemporary Norway than does the realistic novel, especially that designed for older children.

Denmark. Without Hans Christian Andersen, Danish children's literature might have fared better. It is not that his countrymen deify him, as much as it is that the outside world does. Indeed, because modernized versions of his tales do not exist, his now rather antiquated Danish tends to outmode him. Yet his gigantic shadow must have intimidated his literary descendants, just as Dante and Cervantes intimidated theirs. Doubtless other forces also account for the sparseness and relative conventionality of Danish children's literature.

The earliest books were written for the children of the nobility. Not till the passage of the Education Act of 1814 did the poorer ones have access to any suitable reading matter, and this, obedient to the prevailing European fashion, was dour in tone. The climate, of course, relaxed when Andersen appeared with his phenomenal series, still the finest of their kind, of invented or reworked fantastic tales. In 1884 H.V. Kaalund published a picture book of "Fables for Children" based on the popular verse narratives (1833) of a Thüringian pastor, Wilhelm Hey. Three years later an unidentified Danish humorist added three cautionary tales to a translation of six *Struwwelpeter* stories. Though it does not seem to have appeared as a picture book until 1900, Christian Winther in 1830 wrote a pleasing trifle, with an unusual fantastic touch, called "Flugten til Amerika" ("Flight to America"). It is still ranked as a classic. Such are some of the 19th-century oases.

Denmark's general tendency has been to over-rely on translations or adaptations, drawn especially from its neighbour Germany. As against this, it can point to an excellent original tradition of nursery and nonsense rhymes.

Early nursery and nonsense rhymes

The first such collection, made as early as 1843, stimulated not only Andersen but such other 19th-century figures as Johan Krohn, whose "Peter's Christmas" remains a standard seasonal delight. The tradition is relayed to the 20th century by Halfdan Rasmussen, whose collected *Bjørnerim* ("Verse for Children") won the 1964 Danish Children's Book Prize, and Ib Spang Olsen, with his nonsense picture book *The Boy in the Moon* (1962). As for the complementary prose tradition of fireside tales, Denmark had to wait (Andersen was artist, not scholar) for its Grimm until 1884, when a collection made by Svend Grundtvig, the son of N.F.S. Grundtvig, a great bishop-educator, was posthumously published.

As compared with other Scandinavian countries, post-World War II developments lagged. Picture books exhibited much more originality than did teenage literature. Jytte Lyngbirk's girls' novels, notably the love story "Two Days in November," however, are well reputed, as are the realistic fictions, laid against an industrial background, of Tove Ditlevsen. Perhaps Denmark's boldest original talent is Anne Holm, who aroused healthy controversy with her (to some) shocking narrative of a displaced boy's journey to Denmark, the novel *David* (1963; Eng. trans., *North to Freedom,* 1965).

Some informed observers ascribe Denmark's only moderate performance to domination by the teaching profession, to the lingering influence of conventional didacticism, and to the lack of the economic-social forces that stimulate professional writers. As late as 1966 the Minister of Culture commented on the scarcity of Danish juvenile authors, and this at a time when the rest of Scandinavia was, as it remained, in the full flood of the modern movement.

Finland. Although its language and people are not of European origin, Finland is loosely conceived as part of the Scandinavian bloc. Only since December 6, 1917, has it been formally independent. During much of its history Swedish was the language of the educated class. Thus its two outstanding premodern children's writers, the father figure Zacharias Topelius and Anni Swan, wrote their fairy tales and folktales primarily for a Swedish-reading audience. Their works however were promptly translated into Finnish and became part of the native heritage. The same is true of the contemporary Tove Jansson, 1966 Andersen Medal winner, whose series of novels about the fantastic self-contained world of Moomintrolls, though less successful with English-reading children, enchants young readers throughout northern and central Europe.

The labours of Topelius in the children's field and of Elias Lönnrot (compiler of the great Finnish epic-miscellany the *Kalevala,* 1835) in the field of national folklore constituted the soil from which Finnish children's literature was eventually to derive nutriment. But that literature emerged as an identifiable whole only after World War I. It is largely folktale rooted. Indeed this small country became an international focus of folklore research. One student has said that it probably possesses the largest number of folktales in existence, some 30,000 of them. In the early 1960s a fairy tale competition yielded 795 manuscripts, a phenomenal statistic in view of Finland's sparse population.

Finland, despite the fact that its language tends to limit its audience, is part of the main current of children's literature, even though only Jansson has won anything like an international reputation. Two children's poets, Aila Meriluoto and Kirsi Kunnas, have achieved renown.

France. *Overview.* The French themselves are not happy with their record. Writing in the late 1940s, critic Jean de Trigon, in *Histoire de la littérature enfantine, de ma Mère l'Oye au Roi Babar* (Paris, Librairie Hachette, 1950) said: "The French have created little children's literature. They have received more than they have given, but they have assimilated, adapted, transformed. The two are not the same thing, for one must love childhood in general if one is to please children other than one's own." In 1923 Marie-Thérèse Latzarus tolled the passing bell in *La littérature enfantine en France dans la seconde moitié du XIX^e^ siècle* (Paris: Les Presses Universitaires de France): "Children's literature, more's the pity, is dying." And in 1937, in their introduction to *Beaux livres, belles histoires,* the compilers Marguerite Gruny and Mathilde Leriche wrote: "Children's literature in France is still poor, despite the earnest efforts of the last decade."

Criticism of French children's literature

Surely Trigon was too severe. Even more surely Mlle Latzarus has proved a false Cassandra. As for the compilers, the very decade they scorned saw at least three magnificent achievements. The first was Jean de Brunhoff's. Equally talented as author and artist, in 1931 he gave the world that enlightened monarch Babar the Elephant, one of the dozen or so immortal characters in children's literature. The next year saw the start of Paul Faucher's admirable Père Castor series, imaginatively conceived, beautifully designed educational picture books for the very young—not literature, perhaps, but historically comparable to Comenius. Finally, in 1934 appeared the first of Marcel Aymé's miraculous stories about two little girls and the talking animals whose adventures they shared. These

grave-comic fantasies were later collected as *Les Contes du chat perché* (1939; Eng. trans., *The Wonderful Farm*, 1951; *Return to the Wonderful Farm*, 1954), and, along with de Brunhoff and Faucher, were enough to make the decade great.

But there are no other decades to match it. There does exist a disproportion between French literary genius as a whole and the children's literature it has been able to produce. The explanation is uncertain. Mme Le Prince de Beaumont, an adventurous 18th-century lady who wrote over 70 volumes for the young, thought that children's stories should be pervaded by "the spirit of geometry." It is possible that the blame for France's showing might in part be laid on a persistent Cartesian spirit, reinforced by rationalist and positivist philosophies. The Cartesian does not readily surrender to fancy, especially of the more wayward variety. And so, even counting Charles Perrault, the later Charles Nodier, and the contemporary Simone Ratel and Maurice Vauthier, a dearth of first-rate fairy tales may be noted. Cartesians would tend to be weak also in children's verse, in nonsense of any sort, in humour (despite Babar), even in the more imaginative kind of historical novel exemplified by Hans Baumann in Germany and Rosemary Sutcliff in England. Perhaps French children's literature has been restrained by a Catholicism or by a Protestantism that continued to insist on the edifying when mainstream literature had already freed itself from explicit moralism. It may not even be true, as Trigon thinks, that the French have fruitfully assimilated the children's literature of foreign countries. *Alice* has more or less bewildered them; *Huckleberry Finn* has never been digested. The child's cause was not much aided by the triumph of a post-Napoleonic bourgeois cast of thought—or by the wave of post-1871 nationalism.

It is a complicated problem. But perhaps the heart of it lies in the value the French set on maturity. For them childhood at times has seemed less a normal human condition than a handicap. The children themselves have often seemed to feel the pressure, which may account for the fact that they absorb French adult books precociously. The French came much later than did many other countries to the discovery of the child as a figure worthy of the most sensitive understanding; that is what makes Père Castor so important. One is not surprised to note the comparatively recent date (1931) of a study by Aimé Dupuy, translatable as *The Child: A New Character in the French Novel*.

History. If one skips Jean de La Fontaine, whose *Fables* (1668; 1678–79; and 1693), though read by the young, were not meant for them, French children's literature from one point of view begins with the classic fairy tales of Charles Perrault. These were probably intended for the salon rather than the nursery, but their narrative speed and lucidity commended them at once to children. The fairy tales of his contemporary Mme d'Aulnoy, like many others produced in the late 17th and early 18th centuries, are hardly the real thing. With a Watteau-like charm, they taste of the court, as does the *Télémaque* of François Fénelon, a fictionalized lecture on education.

Perrault's fairy tales

Rousseau, as has been noted, did make a difference. *Émile* at least drew attention to what education might be. But the effect on children's literature was not truly liberating. His disciple, Mme de Genlis, set a stern face against make-believe of any sort; all marvels must be explained rationally. Her stories taught children more than they wanted to know, a circumstance that endeared her to a certain type of parent. Sainte-Beuve, to be fair, called her "the most gracious and gallant of pedagogues." One of her qualities, priggishness, was energetically developed by Arnaud Berquin in his *Ami des enfants*. Berquin created the French equivalent of the concurrent English bourgeois morality. In effect, he unconsciously manufactured an adult literature for the young, loading the dice in favour of the values held by parents to be proper for children. Yet one must beware of judging Berquin or his equally moralistic successor Jean-Nicolas Bouilly by today's standards. Children accepted them because they were the best reading available; and Anatole France's tribute in *Le Petit Pierre* (1918) shows that they must have exerted some charm.

The didactic strain, if less marked than in England or Germany, persisted throughout most of the 19th century. To it, Mme de Ségur, in her enormously popular novels, added sentimentality, class snobbery, but also some liveliness and occasional fidelity to child nature. Her "Sophie" series (1850s and 60s), frowned on by modern critics, is still loved by obstinate little French girls. *Sans Famille* (1878), by Hector Malot, a minor classic of the "unhappy child" school, also continues to be read and is indeed a well-told story. But the century's real writer of genius is of course Jules Verne, whose first book, *Un Voyage en ballon*, was originally published in 1851 in a children's magazine, *Le Musée des Familles*.

The period was lively enough. Production was vast. Children's magazines flourished, particularly the remarkable *Magasin d'Éducation et de Récréation*, brilliantly edited by Jules Hetzel. Writers of the stature of George Sand, Alphonse Daudet, and Alexandre Dumas *père* were not too proud to write for children. Much worthy, though transient, work was produced along with a mass of mediocrity, as was the case also in England and the United States. But on the whole, as the century drew to a close, French children might have been better served, even though one critic sees the apogee as occurring between 1860 and 1900.

From the turn of the century to the close of World War II, a number of superior works were produced. The books of de Brunhoff and Faucher have already been cited. A remarkable picture of prehistoric life by J.-H. Rosny (pseudonym of J.-H.-H. Boex) appeared in 1911 and has proved so durable that in 1967 an English translation, *The Quest for Fire*, appeared. *Patapoufs et filifers*, by André Maurois, a gentle satire on war, has lasted (Eng. trans. *Pattypuffs and Thinifers*, 1948; reissued 1968). His fantastic *Le Pays des 36,000 volontés* is almost as popular. The famous dramatist Charles Vildrac has done much to advance the cause of French children's literature. Two pleasant stories of his, remotely decended from *Robinson Crusoe*, *L'Isle rose* and its sequel *La Colonie*, appeared in the 1920s and 1930s. In 1951 his now-classic comic animal tale *Les Lunettes du lion* won immediate success (Eng. trans., *The Lion's Eyeglasses*, 1969). On a high literary level, not accessible to all children, was *Le Petit Prince* (1943, both French and English, *The Little Prince*) by the famous aviator-author Antoine de Saint-Exupéry. The very vagueness of this mystical parable has lent it a certain magnetism. Finally, it is necessary to mention a field in which the French proved incomparable: the comic strip combining action and satire, conceived on a plane of considerable sophistication. Hergé's *Tintin* started in the 1930s and sold over 25,000,000 copies. Also successful was the later and even more unconventional *Astérix* series.

Early 20th-century French literature

Production after 1945 so multiplied that to single out names is bound to involve some injustice. A few, however, by reason either of the originality of their talent or the scope of their achievement, stand out. One is Maurice Druon, whose *Tistou of the Green Fingers* (1957; Eng. trans. 1958), a kind of children's *Candide*, demonstrated how the moral tale, given sufficient sensitivity and humour, can be transmuted into art. Perhaps the most original temperament was that of Henri Bosco, author of four eerie, haunting Provençal novels about the boy Pascalet and his strange involvements with a gypsy companion, a fox, and a dog in a shifting, legend-shrouded natural world. It may be that time will rate these books, like those of the English writer Walter de la Mare, among the finest of their kind. Bosco's *L'Enfant et la rivière* (1955; Eng. trans., *The Boy and the River*, 1956), *Le Renard dans l'île* (1956; Eng. trans., *The Fox in the Island*, 1958), and *Barboche* (1957; Eng. trans. 1959) are notable.

Sound, realistic novels, almost free of excess moralism, were written by at least a dozen reputable authors. Among them Colette Vivier (*The House of the Four Winds*), Paul-Jacques Bonzon (*The Orphans of Simitra*), and Étienne Cattin (*Night Express!*) were distinguished. The domain of the imaginative tale was well represented by Maurice Vauthier, especially by his *Ecoute, petit loup*. Among those noted for their prolific output as well as the high level of their art two names emerged. One is Paul Berna, who has worked in half a dozen genres, including detective stories and science fiction. His *Cheval sans tête* (1955) was pub-

lished in England as *A Hundred Million Francs* and in the United States as *The Horse Without a Head* and was made into a successful Disney film. A "gang" story, using a hard, unemotional tone that recalls Simenon, it may be the best of its kind since *Emil and the Detectives*.

The death of René Guillot removed a deeply conscientious and responsible artist. Guillot, though probably not of the first rank, was not far below it. He left more than 50 widely translated novels for the young and about 10 nonfiction works. For his entire body of work, he received in 1964 the Andersen Prize. His finest achievements in the adventure novel, based on his experiences in Africa, include *The White Shadow* (1948) and *Riders of the Wind* (1953).

Children's verse has at least one delightful practitioner in Pierre Gamarra. His *Mandarine et le Mandarin* contains Fontainesque fables of notable drollery and high technical skill. The Belgian author Maurice Carême also has some repute as a children's poet. In summary, contemporary French activity seems a bit lacking in colour and versatility. But one solid achievement must be registered: the 19th century's legacy was decisively rejected, and at last a natural child prevailed in the imaginative work of the best French contemporaries.

Russia/Soviet Union. Here history breaks cleanly into two periods: pre-1917 and post-1917. In pre-Revolutionary Russia may be observed a most dramatic illustration of the disproportion that may exist between a children's and a mainstream literature. Beyond question the latter is one of the greatest of the modern world. But Russia's pre-1917 children's literature is anemic. It does include the fables of Ivan Krylov; a great treasury of Russian folktales (*skazki*) assembled by A.N. Afanasyev; the epic tales (*byliny*) sung or told to children; the classic by Pyotr Yrshov, *Konyok gorbunok* (1834; English adaption by Ireene Wicker, *The Little Hunchback Horse,* 1942); and other stories and poems enjoyed by young Russians but not originally designed for them. To this folk material should be added the McGuffeyish moral tales that Tolstoy wrote for a series of graded readers. There is also the poet-translator Vasily Zhukovsky, praised by the respected critic Vissarion Belinsky as one of the few poets of the century, part of whose work was dedicated to children.

Pre-Revolutionary Russian literature

On the whole, however, pre-Revolutionary Russia could make only a few feeble gestures toward the creation of an independent children's literature. The submerged peasantry relied on the fireside tale teller. The middle class, while far stronger than is generally recognized, was in no position to stimulate or support a literature for its children. The privileged class looked to the West: the children read Mme de Genlis. Thus it came about that the child was recognized later in Russia than in other parts of western Europe. The critic and children's writer Korney Chukovsky speaks of the "indifference" with which "early childhood was regarded in the past." He then points out that attitudes have changed, so that now the child is "an adored hero."

The Revolution was the watershed. After 1917 Soviet children's literature developed more or less in accord with the necessities of the state. This is not to say that it became identical with Soviet propaganda. Indeed one of the finest teenage novels, Vadim Frolov's *Chto k chemu* (Eng. trans., *What It's All About,* 1965), is quite untouched by dogma of any kind. Soviet children's literature, and especially its vast body of popularized science and technology for the young, however, was in general governed by the ideals of socialist realism, the idolization of the "new Soviet man" (as in the widely read works of Boris Zhitkov and Arkady Gaydar), the exaltation of the machine over the irresponsible furniture of fairyland, and especially a revised version of the pre-18th-century miniature adult view of the child: he now had become a potential Soviet citizen and architect of the Communist future.

Juvenile fiction and biography naturally tended to cue themselves into the crucial episodes of Soviet history. But the theory underlying this basically nationalist literature (suggesting similar developments in Italy and England in the latter half of the 19th century) is by no means clear-cut. The most influential thinker was Maksim Gorky, who during the 1920s called for "creative fantasy," for children's stories "which make out of the human being, instead of a will-less creature or an indifferent workman, a free and active artist, creator of a new culture." He asked for books that would encourage the child to become "a knight of the spirit." Gorky's essays are a curious, endearing mixture of Marxist doctrine (with a utopian slant) and quite standard Western humanistic ideas. It is in Korney Chukovsky's remarkable book *Malenkiye deti* (1925) or *Ot dvukh do pyati* (Eng. trans., *From Two to Five,* 1963), however, that the opposition of two familiar forces, entertainment and instruction, can be sensed most clearly. The tension is typically expressed in Chukovsky's account of the Soviet war over the fairy tale, the opposition to which reached its high point in the 1920s and '30s. "We propose," wrote one journalist in a Moscow magazine in 1924, "to replace the unrealistic folktales and fantasies with simple realistic stories taken from the world of reality and from nature." Chukovsky, himself a writer full of humour and invention, opposed this view, as had Gorky before him.

Gorky's contributions

Though rich in folklore drawn from its many peoples and languages, Soviet culture remained weak in the realm of fantasy. A fairy play such as Marshak's *Krugly god* (Eng. trans., *The Month Brothers,* 1967) seems (at least in English) fatally heavy-handed. That Soviet children's literature was vigorous, varied, and motivated by a genuine concern for the child is undoubted. However, there certainly existed no Soviet "Narnia" series, a Soviet *Borrowers*.

It is not difficult to see that contemporary children's literature in Russia is lively, copious, and probably enjoyed. It is much more difficult for those who have no Russian to judge its value. Occasionally in translation one will come across something as superb as the beautiful nature and animal tales in *Arcturus the Hunting Hound and Other Stories* (1968) by Yury Kazakov. But one can only record, without judging, the vast production of such popular children's writers as Samuil Marshak, Sergey Mikhalkov, Lev Kassil, and N. Nosov. Especially notable is the popularity of poetry, whether it be the work of such past generation writers as Vladimir Mayakovsky or that of the contemporary Agniya Barto. Apparently Russian children read poetry with more passion and understanding than do English-speaking children. The mind of the Russian child is carefully looked after. He is provided with books, often beautifully illustrated, which many Western countries may find hard to match. "Demand from them as much as possible, respect them as much as possible," says Anton Makarenko, the theorist of children's literature. (C.Fa.)

BIBLIOGRAPHY

The scope of literature. *General works:* KENNETH BURKE, *The Philosophy of Literary Form,* 2nd ed. (1967); I.A. RICHARDS, *Practical Criticism: A Study of Literary Judgment* (1929, reprinted 1968) and *Principles of Literary Criticism* (1924, reprinted 1961); GEORGE SAINTSBURY, *A History of Criticism and Literary Taste in Europe from the Earliest Texts to the Present Day,* 3 vol. (1900–04, reprinted 1961); NOWELL C. SMITH (ed.), *Literary Criticism* (1905); KONSTANTIN KOLENDA, *Philosophy in Literature* (1982).

Ancient to modern: A Translation of the Latin Works of Dante Alighieri (1904), see Letter X to Can Grande; CHARLES SEARS BALDWIN, *Ancient Rhetoric and Poetic, Interpreted from Representative Works* (1924), *Medieval Rhetoric and Poetic to 1400, Interpreted from Representative Works* (1928, reprinted 1971), and *Renaissance Literary Theory and Practice* (1939); EDWARD H. BLAKENEY (ed.), *Horace on the Art of Poetry* (1928); CECIL MAURICE BOWRA, *Primitive Song* (1962); S.H. BUTCHER, *Aristotle's Theory of Poetry and Fine Art,* with a critical text and translation of the *Poetics,* 4th ed. (1907; reprinted with corrections, 1932); INGRAM BYWATER, *Aristotle on the Art of Poetry* (1909), reprinted in Aristotle's *Poetics* and *Longinus on the Sublime,* ed. by CHARLES SEARS BALDWIN (1930); PIERRE CORNEILLE, *Oeuvres,* 3 vol. (1862), containing the "Discourse on Dramatic Poetry" and "Discourse on the Three Unities"; ALBERT S. COOK (ed.), *The Art of Poetry* (1892, reprinted 1926), containing a translation of Horace's *Art of Poetry;* J.D. DENNISTON, *Greek Literary Criticism* (1924, reprinted 1971), translations, beginning with Aristophanes; *Dryden's Essays on the Drama,* ed. by WILLIAM STRUNK (1898); ALLAN H. MENCKEN, *A Mencken Chrestomathy* (1949); PAUL ELMER MORE, *The Demon of the Absolute* (1928) and *Shelburne Essays*, 11 series (1904–21); ERIEDRICH NIETZSCHE, *Ecce Homo* and *The Birth of Tragedy*, trans. by CLIFTON EADIMAN (1927); HORATIO, *Works*, 10 vol. (1910); GEORGY V. PLEKHANOV, *Art and Society*, trans. by ALERED GOLDSTEIN (1936), a Marxist analysis; EDGAR ALLAN POE, *Selections from the Critical Writings of Edgar Allan Poe*, ed. with an introduction by E.C. PRESCOTT (1909); EZRA POUND, *ABC of Reading* (1934) and *Literary Essays* (1954); HERBERT READ, *Reason and Romanticism* (1926); CHARLES AUGUSTIN SAINTE-BEUVE, *Causeries du lundi*, 15 vol. (1852–62; Eng. trans., 8 vol., 1909–11), contains "What Is a Classic?"; *Shelley's Literary and Philosophical Criticism*, ed. by JOHN SHAWCROSS (1909); LEO TOLSTOY, *What Is Art?*, trans. by AYLMAR MAUDE (1932); LEON TROTSKY, *Literature and Revolution*, trans. by ROSE STRUNSKY (1925, reprinted 1957); PAUL VALERY, *Littérature* (1929) and *Variété*, trans. by MALCOLM COWLEY (1927); WILLIAM CARLOS WILLIAMS, *In the American Grain* (1925); EDMUND WILSON, *Axel's Castle* (1931) and *The Triple Thinkers*, rev. ed. (1952 and 1963); EMILE ZOLA, *The Experimental Novel and Other Essays*, trans. by BELLE M. SHERMAN (1893).

Contemporary: CECIL MAURICE BOWRA, *In General and Particular* (1964); STANLEY BURNSHAW (ed.), *The Poem Itself*, rev. ed. (1967); CYRIL CONNOLLY, *The Modern Movement* (1965); PAUL GOODMAN, *The Structure of Literature* (1954); MARSHALL MCLUHAN, *Understanding Media* (1964); R.E. SCHOLES and R.L. KELLOGG, *The Nature of Narrative* (1966); HERBERT READ, *The Nature of Literature* (1956).

The nature of poetry. The most convenient way to get to know poetry is to read poetry. It would be invidious for the writer of a general article on the subject to prejudice the reader by making a selection of poems or poets; in experience, anyhow, one's acquaintance with poetry comes about chiefly by love and accident, supported, when not undermined, by schools, colleges, and libraries. Beyond that, the bibliographical temptation is to put before the reader numerous learned works that are not poetry but about poetry; whatever their usefulness at various stages of study, and it may be great, they must not substitute for the reading of poetry itself. Therefore no such list is attempted.

The beginning reader, however, may well be able to use some help in interpreting, such as a critical or explanatory anthology. CLEANTH BROOKS and ROBERT PENN WARREN, *Understanding Poetry*, 4th ed. (1976), is still probably the best of its kind, as numerous imitations amply attest. See also TZVETAN TODOROV, *Introduction to Poetics* (1981; originally published in French, 1973), a comprehensive introduction to modern poetics.

Prosody. *Greek and Latin prosody:* PAUL MAAS, *Greek Metre*, trans. by HUGH LLOYD-JONES (1962); ULRICH VON WILAMOWITZ-MOLLENDOREE, *Griechische Verskunst* (1921), the definitive work on the subject but difficult for beginners.

Prose rhythm: MORRIS W. CROLL, *Style, Rhetoric, and Rhythm* (1966), contains classic essays on the period styles of prose and on musical scansion of verse; GEORGE SAINTSBURY, *A History of English Prose Rhythm* (1912, reprinted 1965).

History and uses of English prosody: WILLIAM BEARE, *Latin Verse and European Song: A Study in Accent and Rhythm* (1957); ROBERT BRIDGES, *Milton's Prosody*, rev. ed. (1921); HARVEY S. GROSS, *Sound and Form in Modern Poetry: A Study of Prosody from Thomas Hardy to Robert Lowell* (1964); T.S. OMOND, *English Metrists* (1921, reprinted 1968); GEORGE SAINTSBURY, *A History of English Prosody from the Twelfth Century to the Present*, 3 vol. (1906–10); JOHN THOMPSON, *The Founding of English Metre* (1961).

Theories of prosody: SEYMOUR B. CHATMAN, *A Theory of Meter* (1965); OTTO JESPERSEN, "Notes on Metre," in *The Selected Writings of Otto Jespersen* (1962); WILLIAM K. WIMSATT, JR., and MONROE C. BEARDSLEY, "The Concept of Metre: An Exercise in Abstraction," in WILLIAM K. WIMSATT, JR., *Hateful Contraries* (1965); YVOR WINTERS, "The Audible Reading of Poetry," in *The Function of Criticism* (1957).

Non-Western prosody: ROBERT H. BROWER and EARL MINER, *Japanese Court Poetry* (1961); JAMES LEGGE (ed. and trans.), *The Chinese Classics*, vol. 4 (1960).

General works: PAUL EUSSELL, JR., *Poetic Meter and Poetic Form* (1965); HARVEY S. GROSS (ed.), *The Structure of Verse: Modern Essays on Prosody* (1966); JOSEPH MALOE, *A Manual of English Meters* (1970).

Epic. H.M. CHADWICK, *The Heroic Age* (1912), and H.M. and N.K. CHADWICK, *The Growth of Literature*, vol. 1, *The Ancient Literatures of Europe* (1932), are two classic works on European heroic poetries that are still valuable. A more comprehensive and up-to-date general survey is given in C.M. BOWRA, *Heroic Poetry* (1952); and J. DE VRIES, *Heldenlied und Heldensage* (1961; Eng. trans., *Heroic Song and Heroic Legend*, 1963). A.B. LORD, *The Singer of Tales* (1960), was written by an authority on the Balkan oral epic of the *guslari*. On Homer, see G.S. KIRK, *The Songs of Homer* (1962); W. SCHADEWALDT, *Von Homers Welt und Werk*, 4th ed. (1965); C.M. BOWRA, *Homer and His Forerunners* (1955); and R. CARPENTER, *Folk Tale, Fiction and Saga in the Homeric Epics* (1946). E.R. SCHRODER, *Germanische Heldendichtung* (1935), is a basic reference book for the study of the Germanic epic. J.B. PRITCHARD, *The Ancient Near East* (1958), gives summaries and translations of Akkadian and Ugaritic epics. A theory of the epics of the Indo-Europeans is presented by G. DUMEZIL in *Mythe et épopée*, vol. 1–2 (1968–71). For the use of mythical themes in the epics of the Indo-Europeans, see also D. WARD, *The Divine Twins: An Indo-European Myth in Germanic Tradition* (1968). MICHAEL MURRIN, *The Allegorical Epic* (1980), is a survey of the European tradition.

Fable, parable, and allegory. *Fable:* F. CHAMBRY, *Fables* (1927), in Greek and French; S.A. HANDEORD, *Fables of Aesop* (1956); B. PARES, *Krylov's Fables* (1926); MARIANNE MOORE, *Fables of La Fontaine* (1954). For commentary on fables, see: P. CLARAC, *La Fontaine, l'homme et l'oeuvre* (1947); B.E. PERRY, *Aesopica* (1952).

Parable: A.M. HUNTER, *The Parables Then and Now* (1971); ETA LINNEMANN, *Gleichnisse Jesu*, 3rd ed. (1964; Eng. trans., *The Parables of Jesus*, 1966); T.W. MANSON (ed.), *The Sayings of Jesus as Recorded in the Gospels According to St. Matthew and St. Luke* (1949); D.C. ALLEN, *The Legend of Noah: Renaissance Rationalism in Art, Science and Letters* (1963); HEINZ POLITZER, *Franz Kafka: Parable and Paradox* (1962).

Allegory: (*General theory and history*): D.C. ALLEN, *Mysteriously Meant: The Rediscovery of Pagan Symbolism and Allegorical Interpretation in the Renaissance* (1970); C.H. DODD, *The Authority of the Bible* (1958); A.S. FLETCHER, *Allegory: The Theory of a Symbolic Mode* (1964); R.M. GRANT, *The Letter and the Spirit* (1958); EDWIN HONIG, *Dark Conceit: The Making of Allegory* (1959); C.S. LEWIS, *The Allegory of Love* (1936); JEAN PEPIN, *Mythe et allégorie* (1958); ROSEMOND TUVE, *Allegorical Imagery* (1966); MAUREEN QUILLIGAN, *The Language of Allegory: Defining the Genre* (1979).

(*Pagan and Christian interpretation*): KENNETH BURKE, *The Rhetoric of Religion* (1961); HENRY CHADWICK, *Early Christian Thought and the Classical Tradition* (1966); C.H. DODD, *The Interpretation of the Fourth Gospel* (1968); A.O. LOVEJOY, *The Great Chain of Being* (1936); H. DE LUBAC, *Exégèse médiévale: les quatre sens de l'Écriture* (1959–64); A. MOMIGLIANO (ed.), *The Conflict Between Paganism and Christianity in the Fourth Century* (1963); G. VON RAD, *Theologie des Alten Testaments*, 2nd ed. (1958; Eng. trans., *Old Testament Theology*, 2 vol., 1962–65), RENE ROQUES, *L'Univers dionysien* (1954); B. SMALLEY, *The Study of the Bible in the Middle Ages*, 2nd ed. (1952); H.A. WOLFSON, *The Philosophy of the Church Fathers* vol. 1, *Faith, Trinity, Incarnation* (1956); *Philo, Foundations*

of Religious Philosophy in Judaism, Christianity, and Islam, 2 vol. (1947).

(*Typology and typological symbolism*): ERICH AUERBACH, "Figura," in *Scenes from the Drama of European Literature: Six Essays* (1959); A.C. CHARITY, *Events and Their Afterlife: The Dialectics of Christian Typology in the Bible and Dante* (1966); JEAN DANIELOU, *Sacramentum futuri: études sur les origines de la typologie biblique* (1950; Eng. trans., *From Shadows to Reality: Studies in the Biblical Typology of the Fathers,* 1960); AUSTIN EARRER, *A Rebirth of Images: The Making of St. John's Apocalypse* (1949); R.P.C. HANSON, *Allegory and Event* (1959); W.G. MADSEN, *From Shadowy Types to Truth: Studies in Milton's Symbolism* (1968).

(*Medieval allegory*): ERICH AUERBACH, *Dante als Dichter der irdischen Welt* (1929; Eng. trans., *Dante: Poet of the Secular World,* 1961); M.W. BLOOMEIELD, "Symbolism in Medieval Literature," *Modern Philology,* 56:73–81 (1958), and *Piers Plowman As a Fourteenth-Century Apocalypse* (1962); EDGAR DE BRUYNE, *Études d'esthétique médiévale,* 3 vol. (1946); M.D. CHENU, *La Théologie au douzième siècle* (1957; Eng. trans. of nine selected essays, *Nature, Man, and Society in the Twelfth Century,* 1968); E.R. CURTIUS, *Europäische Literatur und lateinisches Mittelalter* (1948; Eng. trans., *European Literature and the Latin Middle Ages,* 1953); RAYMOND KLIBANSKY, *The Continuity of the Platonic Tradition During the Middle Ages* (1939); C.S. LEWIS, *The Discarded Image: An Introduction to Medieval and Renaissance Literature* (1964); JOSEPH A. MAZZEO, *Medieval Cultural Tradition in Dante's Comedy* (1960); D.W. ROBERTSON and B.F. HUPPE, *Piers Plowman and Scriptural Tradition* (1951); CHARLES SINGLETON, *Dante Studies,* vol. 1, *Commedia* (1954).

(*Renaissance and modern allegory*): DOUGLAS BUSH, *Mythology and the Renaissance Tradition in English Poetry,* rev. ed. (1963); WALTER BENJAMIN, *Ursprung des deutschen Trauerspiels* (1928); HAROLD BLOOM, *The Visionary Company* (1961); A.S. ELETCHER, *The Prophetic Moment: An Essay on Spenser* (1971); ALASTAIR FOWLER, *Triumphal Forms: Structural Patterns in Elizabethan Poetry* (1970); NORTHROP ERYE, *Fearful Symmetry: A Study of William Blake* (1947); U.M. KAUEMAN, *The Pilgrim's Progress and Traditions in Puritan Meditation* (1966); MICHAEL MURRIN, *The Veil of Allegory: Some Notes Toward a Theory of Allegorical Rhetoric in the English Renaissance* (1969); JEAN SEZNEC, *La Survivance des dieux antiques* (1939; Eng. trans., *The Survival of the Pagan Gods,* rev. ed., 1953); E.M.W. TILLYARD, *The Elizabethan World Picture* (1943); EDGAR WIND, *Pagan Mysteries in the Renaissance,* new ed. (1968).

Ballad. F.J. CHILD (ed.), *The English and Scottish Popular Ballads,* 5 vol. (1882–98), is the canon of traditional balladry, the tunes for which are supplied in B.H. BRONSON (ed.), *Traditional Tunes of the Child Ballads,* 4 vol. (1959–72). Important broadside collections include *The Roxburghe Ballads,* ed. by W. CHAPPELL and J.W. EBSWORTH, 9 vol. (1871–99); and *The Pepys Ballads,* ed. by H.E. ROLLINS, 8 vol. (1929–32). See also *The Common Muse: An Anthology of Popular British Ballad Poetry, XVth–XXth Century,* ed. by V. DE SOLA PINTO and A.E. RODWAY (1957); C.M. SIMPSON, *The British Broadside Ballad and Its Music* (1966); T.P. COFFIN, *The British Traditional Ballad in North America,* rev. ed. (1963); and G.M. LAWS, *Native American Balladry,* rev. ed. (1964). Ballad criticism and scholarship are analyzed in S.B. HUSTVEDT, *Ballad Books and Ballad Men* (1930); D.K. WILGUS, *Anglo-American Folksong Scholarship Since 1898* (1959); A.B. FRIEDMAN, *The Ballad Revival: Studies in the Influence of Popular on Sophisticated Poetry* (1961); C.J. SHARP, *English Folk-Song: Some Conclusions* (1907); G.H. GEROULD, *Ballad of Tradition* (1932); and M.J.C. HODGART, *Ballads* (1950). A.T. QUILLERCOUCH (ed.), *The Oxford Book of Ballads* (1910, reissued 1951); M. LEACH (ed.), *The Ballad Book* (1955); and A.B. ERIEDMAN (ed.), *Folk Ballads of the English Speaking World* (1956), are the standard anthologies.

Romance. Among older works the most notable are RICHARD HURD, *Letters on Chivalry and Romance* (1764); GEORGE ELLIS, *Specimens of Early English Metrical Romances,* 3 vol. (1805); and SIR WALTER SCOTT, "Essay on Romance" in the Supplement to the 1815–24 edition of the *Encyclopædia Britannica.* The academic study of romance as a form of imaginative narrative may be said to have begun in 1897 with the publication of W.P. KER, *Epic and Romance* (2nd ed. 1908, reprinted 1957), and of GEORGE SAINTSBURY, *The Flourishing of Romance and the Rise of Allegory.* (*Origins and sources*): EDMOND EARAL, *Recherches sur les sources latines des contes et romans courtois du moyen âge* (1913); JESSIE L. WESTON, *From Ritual to Romance* (1920, reprinted 1957); ROGER S. LOOMIS, *Arthurian Tradition and Chrétien de Troyes* (1949); and JEAN MARX, *La Légende arthurienne et le Graal* (1952). (*Nature and development*): FANNI BOGDANOW, *The Romance of the Grail* (1966); EUGENE VINAVER, *The Rise of Romance* (1971); and ROSEMOND TUVE, *Allegorical Imagery* (1966). J.D. BRUCE, *The Evolution of Arthurian Romance,* 2nd ed., 2 vol. (1928), at one time the standard work in this field, has now been largely superseded by R.S. LOOMIS (ed.), *Arthurian Literature in the Middle Ages: A Collaborative History* (1959). Since 1949 the International Arthurian Society has been publishing an annual *Bibliographical Bulletin* covering the whole range of Arthurian literature in all languages.

Saga. The best guide to current research is the annual *Bibliography of Old Norse-Icelandic Studies* (from 1964); for earlier works on the sagas, see *Islandica* (from 1908). Standard editions of important texts include *Íslenzk fornrit* (from 1933); *Altnordische Saga-Bibliothek,* ed. by G. CEDERSCHIOLD *et al.,* 18 vol. (1892–1929); *Editiones Arnamagnaeanae* (from 1958); *Fornaldar Sögur Nordurlanda,* 4 vol. (1950); *Sturlunga saga,* 2 vol. (1946); and *Nelson's Icelandic Texts* (from 1957), with English translations. Useful general surveys of the sagas are PETER HALLBERG, *Den Isländska Sagan* (1956; Eng. trans., *The Icelandic Saga,* 1962); s. NORDAL, *Sagalitteraturen* (1953); and KURT SCHIER, *Sagaliteratur* (1969). For criticism and interpretation of the saga, see WALTER BAETKE, *Über die Entstehung der Isländersagas* (1956); THEODORE M. ANDERSSON, *The Problem of Icelandic Saga Origins* (1964); GABRIEL TURVILLE-PETRE, *Origins of Icelandic Literature* (1953); THEODORE M. ANDERSSON, *The Icelandic Family Saga: An Analytic Reading* (1967); HERMANN PALSSON, *Art and Ethics in Hrafnkel's Saga* (1971); EINAR O. SVEINSSON, *Á Njálsbúd, bok um mikid listaverk* (1943; Eng. trans., *Njáls Saga: A Literary Masterpiece,* 1971); GABRIEL TURVILLE-PETRE, *The Heroic Age of Scandinavia* (1951) and *Myth and Religion of the North* (1964); and HERMANN PALSSON and PAUL EDWARDS, *Legendary Fiction in Medieval Iceland* (1970). See also MARGARET SCHLAUCH, *Romance in Iceland* (1934); and E.E. HALVORSEN, *The Norse Version of the Chanson de Roland* (1959).

Of translations into English, the following may be mentioned: L.M. HOLLANDER (ed. and trans.), *Heimskringla: History of the Kings of Norway* (1964) and *The Sagas of Kormák and the Sworn Brothers* (1949); GWYN JONES (ed. and trans.), *The Vatnsdalers' Saga* (1944), *Egil's Saga* (1960), and *Eirik the Red, and Other Icelandic Sagas* (1961); GEORGE JOHNSTON (ed. and trans.), *The Saga of Gisli* (1963); HERMANN PALSSON (ed. and trans.), *Hrafnkel's Saga and Other Icelandic Stories* (1971); PAUL EDWARDS and HERMANN PALSSON (eds. and trans.), *Arrow-Odd: A Medieval Novel* (1970), *Gautrek's Saga, and Other Medieval Tales* (1968), *Hrolf Gautreksson: A Viking Romance* (1972), and *Eyrbyggja Saga* (1973); MAGNUS MAGNUSSON and HERMANN PALSSON (eds. and trans.), *Njal's Saga* (1960), *The Vinland Sagas* (1965), *King Harald's Saga* (1966), and *Laxdaela Saga* (1969); M.H. SCARGILL and MARGARET SCHLAUCH (eds. and trans.), *Three Icelandic Sagas* (1950); J.I. YOUNG (ed. and trans.), *The Prose Edda of Snorri Sturluson: Tales from Norse Mythology* (1954); J.H. MCGREW (ed. and trans.), *Sturlunga Saga,* vol. 1 (1970); DENTON EOX and HERMANN PALSSON (eds. and trans.), *Grettir's Saga* (1973).

Novel. The following works deal in general terms with the reader's approach to the novel: WALTER ALLEN, *Reading a Novel,* rev. ed. (1963); VAN METER AMES, *Aesthetics of the Novel* (1928, reprinted 1966); CLEANTH BROOKS and R.P. WARREN (eds.), *Understanding Fiction,* 3rd. ed. (1979); ALEXANDER COMEORT, *The Novel and Our Time* (1948); PELHAM EDGAR, *The Art of the Novel* (1933, reprinted 1966); WILSON EOLLETT, *The Modern Novel: A Study of the Purpose and Meaning of Fiction,* rev. ed. (1923); E.M. FORSTER, *Aspects of the Novel* (1927, many reprintings); PERCY LUBBOCK, *The Craft of Fiction,* new ed. (1957).

The following are concerned with the problems of writing fiction and are all the work of novelists: PHYLLIS BENTLEY, *Some Observations on the Art of Narrative* (1946); *Conrad's Prefaces to His Works,* with an essay by EDWARD GARNETT (1937); HENRY JAMES, *The Art of Fiction and Other Essays,* ed. by MORRIS ROBERTS (1948), and *The Art of the Novel,* introduction by R.P. BLACKMUR (1934); EDITH WHARTON, *The Writing of Fiction* (1925); THOMAS WOLFE, *The Story of a Novel* (1936).

The various elements of the novel are dealt with in the following: BONAMY DOBREE, *Modern Prose Style,* 2nd ed. (1964); MAREN ELWOOD, *Characters Make Your Story* (1942); MANUEL KOMROEE, *How to Write a Novel* (1950); W. VAN O'CONNOR (ed.), *Forms of Modern Fiction* (1948); GEORGE G. WILLIAMS (ed.), *Readings for Creative Writers* (1938).

The following studies deal with the style and philosophy of the novel in the wider sense: DAVID DAICHES, *The Novel and the Modern World,* rev. ed. (1960); AGNES HANSEN, *Twentieth Century Forces in European Fiction* (1934); ALERED KAZIN, *On Native Grounds* (1942); Y. KRIKORIAN (ed.), *Naturalism and the Human Spirit* (1944); GEORGE LUKACS, *Studies in European Realism* (1950), and *The Historical Novel* (1962); H.J. MULLER, *Modern Fiction* (1937); and MAS'UD ZAVARZADEH, *The Mythopoeic Reality: The Postwar American Nonfiction Novel* (1976).

Short story. K.P. KEMPTON examines the genre, emphasizing

theme and meaning, in *The Short Story* (1947). An excellent analysis of story techniques is offered in SEAN O'FAOLAIN, *The Short Story* (1948). BRANDER MATTHEWS, *The Philosophy of the Short Story* (1901, reprinted 1931), is predicated on Poe's theories. A provocative thesis regarding the nature of stories is presented in FRANK O'CONNOR, *The Lonely Voice: A Study of the Short Story* (1963). H.S. SUMMERS has collected some of the more important discussions of the form in *Discussions of the Short Story* (1963). *Storytellers and Their Art*, ed. by G. SAMPSON and C. BURKHART (1963), contains comments of various authors on the form. More specialized discussions of the form are contained in F.L. PATTEE, *The Development of the American Short Story* (1923); R.B. WEST, *Short Story in America, 1900–1950* (1952); E.K. BENNETT, *A History of the German Novelle*, 2nd ed. rev. by H.M. WAIDSON (1961); and S. TRENKNER, *Greek Novella in the Classical Period* (1958).

Dramatic literature. ALLARDYCE NICOLL, *World Drama* (1949), offers the best survey of the whole field, but should be supplemented by JOHN GASSNER and EDWARD QUINN, *The Reader's Encyclopaedia of World Drama* (1969); and PHYLLIS HARTNOLL, *The Oxford Companion to the Theatre*, 3rd ed. (1967). The classical texts of dramatic theory and criticism may be found in a collection by B.H. CLARK, *European Theories of the Drama*, rev. ed. (1965), which also contains an extensive bibliography. The *Natya Shastra* of BHARATA, the classic source for Indian dramatic theory, was translated by M.M. GHOSE in 1951.

Books of importance in the development of modern theory on drama are BERNARD BECKERMAN, *Dynamics of Drama* (1970); E.R. BENTLEY, *The Life of the Drama* (1964); KENNETH BURKE, *A Grammar of Motives* (1945); FRANCIS FERGUSSON, *The Idea of a Theatre* (1949); S.K. LANGER, *Feeling and Form* (1953); ELDER OLSON, *Tragedy and the Theory of Drama* (1961); RONALD PEACOCK, *The Art of Drama* (1957); J.L. STYAN, *The Elements of Drama* (1960); and KEIR ELAM, *The Semiotics of Theatre and Drama* (1980), a technical semiotic approach.

The finest study of the classical drama of Greece is probably H.D.F. KITTO, *Greek Tragedy*, 3rd ed. (1961); and for the medieval drama are recommended KARL YOUNG, *The Drama of the Medieval Church*, 2 vol. (1933); HARDIN CRAIG, *English Religious Drama of the Middle Ages* (1955); and O.B. HARDISON, *Christian Rite and Christian Drama in the Middle Ages* (1965). Oriental theatre is surveyed in FAUBION BOWERS, *Japanese Theatre* (1952); F.A. LOMBARD, *An Outline History of the Japanese Drama* (1928), which should be read in conjunction with ARTHUR WALEY'S classic *The Noh Plays of Japan* (1922); A.C. SCOTT, *The Classical Theatre of China* (1957); A.B. KEITH, *The Sanskrit Drama* (1924); with H.W. WELLS's comparative studies, *The Classical Drama of India* (1963), and *The Classical Drama of the Orient* (1965).

M.C. BRADBROOK, *Themes and Conventions of Elizabethan Tragedy* (1935); and U.M. ELLIS-FERMOR, *Jacobean Drama* (1936), are standard surveys of the English Renaissance drama; and for standard Shakespearean criticism the reader should consult A.M. EASTMAN, *A Short History of Shakespearean Criticism* (1968). The classic source books for the commedia dell'arte are P.L. DUCHARTRE, *La Comédie italienne* (Eng. trans., *The Italian Comedy*, 1929, reprinted 1966); and ALLARDYCE NICOLL, *Masks, Mimes and Miracles* (1931). On the French classical drama H.C. LANCASTER, *A History of French Dramatic Literature in the Seventeenth Century*, 9 vol. (1929–42), is standard; but MARTIN TURNELL, *The Classical Moment* (1947), deals more briefly with Corneille, Racine, and Molière. On Restoration comedy J.L. PALMER, *The Comedy of Manners* (1913); and BONAMY DOBREE, *Restoration Comedy* (1924), remain the best.

American drama is surveyed briefly in W.J. MESERVE, *An Outline History of American Drama* (1965); and A.S. DOWNER, *Fifty Years of American Drama, 1900–1950* (1951). U.M. ELLIS-FERMOR, *The Irish Dramatic Movement*, 2nd ed. (1954), is a comprehensive study of the early years at Dublin's Abbey Theatre; and on Western drama after Ibsen the reader should begin by consulting ERIC BENTLEY, *The Playwright as Thinker* (1946, reprinted 1955); ROBERT BRUSTEIN, *The Theatre of Revolt* (1964); and J.L. STYAN, *The Dark Comedy*, 2nd ed. (1968), an account of the blending of tragic and comic elements in the post-Ibsen theatre.

Comedy. C.L. BARBER, *Shakespeare's Festive Comedy: A Study of Dramatic Form and Its Relation to Social Custom* (1959), Shakespearean comedy considered in relation to archetypal patterns of folk ritual and games; LANE COOPER, *An Aristotelian Theory of Comedy, with an Adaptation of the Poetics and a Translation of the Tractatus Coislinianus* (1922), the only modern text of the *Tractatus*, with an introductory essay relating it to Aristotle's theory of tragedy, and a conjectural reconstruction of the lost treatise on comedy based on the example of the *Poetics*; F.M. CORNFORD, *The Origin of Attic Comedy* (1914; ed. by T.H. GASTER, 1961), an account of the development of Greek comedy from primitive fertility rites, and of the survival of traces of these ceremonials in the extant plays of Aristophanes; CYRUS HOY, *The Hyacinth Room: An Investigation into the Nature of Comedy, Tragedy, and Tragicomedy* (1964), an examination of the plays of Euripides, Shakespeare, Jonson, Molière, Ibsen, Strindberg, Pirandello, Beckett, and Ionesco; J.W. KRUTCH, *Comedy and Conscience After the Restoration* (1924, reprinted with a new preface and additional bibliographic material, 1949), a study of the decline of Restoration comedy and the rise of sentimental comedy at the end of the 17th and the beginning of the 18th century; K.M. LYNCH, *The Social Mode of Restoration Comedy* (1926), the best available account of the relation of the plays of Dryden, Etherege, Wycherley, Congreve, and their contemporaries to their social milieu; A.W. PICKARD-CAMBRIDGE, *Dithyramb, Tragedy, and Comedy* (1927; 2nd ed. rev. by T.B.L. WEBSTER, 1962), and *The Dramatic Festivals of Athens* (1953; 2nd ed. rev. by J. GOULD and D.M. LEWIS, 1968), the definitive accounts of the origins of Greek comedy and tragedy; and F.H. RISTINE, *English Tragicomedy: Its Origin and History* (1910), the only full-scale account of the subject through the 17th century.

Tragedy. A lengthier development of many of the points made in this section may be found in R.B. SEWALL, *The Vision of Tragedy* (1959). J. JONES, *On Aristotle and Greek Tragedy* (1962), examines the origins of Greek tragedy. Works concentrating on modern tragedy include GEORGE STEINER, *The Death of Tragedy* (1961); WALTER KERR, *Tragedy and Comedy* (1968); and RAYMOND WILLIAMS, *Modern Tragedy* (1966). Special aspects of tragedy are treated in J.M.R. MARGESON, *The Origins of English Tragedy* (1967); EUGENE VINAVER, *Racine and Poetic Tragedy* (1955); and A.C. BRADLEY, *Shakespearean Tragedy* (1904). A useful anthology of writings on tragedy is LIONEL ABEL (ed.), *Moderns on Tragedy* (1967). Other recent works on the subject include RICHMOND HATHORN, *Tragedy, Myth, and Mystery* (1962); MURRAY KRIEGER, *The Tragic Vision: Variations on a Theme in Literary Interpretation* (1960); DOROTHY KROOK, *Elements of Tragedy* (1969); and TIMOTHY J. REISS, *Tragedy and Truth* (1980).

Satire. DAVID WORCESTER, *The Art of Satire* (1940), a study of rhetorical techniques available to the satirist; JAMES R. SUTHERLAND, *English Satire* (1958), a sound scholarly history; ALVIN B. KERNAN, *The Cankered Muse: Satire of the English Renaissance* (1959), valuable theory and criticism; ROBERT C. ELLIOTT, *The Power of Satire: Magic, Ritual, Art* (1960), on the origins of satire in magic and its development into an art; RONALD PAULSON, *The Fictions of Satire* (1967), a study of satire in fiction from Lucian to Swift, and (ed.), *Satire: Modern Essays in Criticism* (1971), an authoritative and indispensable collection; MATTHEW J.C. HODGART, *Satire* (1969), a well-illustrated, readable survey of satire in many forms and in many countries.

Other genres. On the essay, see R.D. O'LEARY, *The Essay* (1928), which analyzes the essay theoretically and examines several categories of essayists. DAVID DAICHES gives a brief and lively introduction to his anthologies of essays: *A Century of the Essay: British and American* (1951), and *More Literary Essays* (1968). On letter writing in general, the best piece is by GUSTAVE LANSON, in French: Introduction to *Choix de lettres du XVII^e siècle*, 5th rev. ed. (1898), reprinted in Lanson's *Essais de méthode, de critique et d'histoire littéraire*, pp. 243–258 (1965). On personal literature, the diary, autobiography, and the questions raised by those forms of prose, see HENRI PEYRE, *Literature and Sincerity* (1963).

Biography. *Critical and scholarly books:* JAMES L. CLIFFORD, *From Puzzles to Portraits: Problems of a Literary Biographer* (1970), examples of the author's own research followed by an analysis of biographical problems; LEON EDEL, *Literary Biography* (1959), essentially an account of the methods, psychological and narrative, used by the author in his multivolume life of Henry James; JOHN A. GARRATY, *The Nature of Biography* (1957), a historical survey coupled with a study of biographical methods, with emphasis on aids offered by psychology; PAUL M. KENDALL, *The Art of Biography* (1965), a historical survey, with emphasis on contemporary biography, and a study of biographical problems from the viewpoint of a practicing biographer; ANDRE MAUROIS, *Aspects de la biographie* (1928; Eng. trans. 1930) and HAROLD NICOLSON, *The Development of English Biography* (1928), particularly interesting for complementary views of the "new" biography of the 1920s by two eminent biographers; ROY PASCAL, *Design and Truth in Autobiography* (1960), a historical survey and a study of the chief problems, aspects, and varieties of autobiography; WILLIAM M. RUNYAN, *Life Histories and Psychobiography* (1982), a discussion of methodologies used in conducting psychobiographical research.

Anthologies: JAMES L. CLIFFORD (ed.), *Biography as an Art: Selected Criticism 1560–1960* (1962); WILLIAM H. DAVENPORT and BEN SIEGEL (eds.), *Biography Past and Present* (1965), contains a number of critical essays as well as biographical

selections; EDGAR JOHNSON (ed.), *A Treasury of Biography* (1941); JOHN C. METCALFE (ed.), *The Stream of English Biography* (1930).

Literary criticism. A useful compilation of essential texts is MARK SCHORER, JOSEPHINE MILES, and GORDON MCKENZIE (eds.), *Criticism,* rev. ed. (1958). The best survey of critical history is WILLIAM K. WIMSATT, JR., and CLEANTH BROOKS, *Literary Criticism: A Short History* (1957); G.M.A. GRUBE, *The Greek and Roman Critics* (1965); JOEL E. SPINGARN, *A History of Literary Criticism in the Renaissance,* 5th ed. (1925, paperback edition 1963); WALTER J. BATE, *From Classic to Romantic* (1946, reprinted 1961); and RENE WELLEK, *A History of Modern Criticism, 1750–1950,* 4 vol. (1955–65), are more specialized historical studies. Important theoretical statements are M.H. ABRAMS, *The Mirror and the Lamp* (1953); RENE WELLEK and AUSTIN WARREN, *Theory of Literature,* 3rd rev. ed. (1966); NORTHROP FRYE, *Anatomy of Criticism* (1957); and WAYNE C. BOOTH, *The Rhetoric of Fiction* (1961). WILLIAM EMPSON, *Seven Types of Ambiguity,* 3rd ed. (1956, reprinted 1963); ERICH AUERBACH, *Mimesis* (1946; Eng. trans. 1953); and LIONEL TRILLING, *The Liberal Imagination* (1950), are representative examples of modern criticism, combining theory with analysis of a wide variety of texts. See also DOUWE W. FOKKEMA and ELRUD KUNNE-IBSCH, *Theories of Literature in the Twentieth Century: Structuralism, Marxism, Aesthetics of Reception, Semiotics* (1978).

Children's literature. *Historical, critical:* (*Europe*): BETTINA HURLIMANN, *Europäische Kinderbücher in drei Jahrhunderten,* 2nd ed. (1963; Eng. trans., *Three Centuries of Children's Books in Europe,* 1968). (*England*): GILLIAN AVERY, *Nineteenth Century Children: Heroes and Heroines in English Children's Stories 1780–1900* (1965); FLORENCE V. BARRY, *A Century of Children's Books* (1922, reprinted 1968); MARCUS CROUCH, *Treasure Seekers and Borrowers: Children's Books in Britain 1900–1960* (1962); F.J. HARVEY DARTON, *Children's Books in England: Five Centuries of Social Life* (1932); ROGER LANCELYN GREEN, *Tellers of Tales: British Authors of Children's Books from 1800 to 1964,* rev. ed. (1965); PERCY MUIR, *English Children's Books, 1600 to 1900* (1954); M.F. THWAITE, *From Primer to Pleasure: An Introduction to the History of Children's Books in England, from the Invention of Printing to 1900* (1963); JOHN ROWE TOWNSEND, *Written for Children: An Outline of English Children's Literature* (1965). (*Canada*): SHEILA EGOFF, *The Republic of Childhood: A Critical Guide to Canadian Children's Literature in English* (1967). (*Anglo-American mainly*): CORNELIA MEIGS *et al., A Critical History of Children's Literature: A Survey of Children's Books in English from Earliest Times to the Present,* rev. ed. (1969). (*Germany*): IRENE DYHRENFURTH-GRAEBSCH, *Geschichte des deutschen Jugendbuches,* 3rd rev. ed. (1967); H.L. KOSTER, *Geschichte der deutschen Jugendliteratur* (1968). (*Sweden*): EVA VON ZWEIGBERGK, *Barnboken I Sverige 1750–1950* (1965). (*France*): MARIE-THERESE LATZARUS, *La Littérature enfantine en France dans la seconde moitié du XIX^e^ siècle* (1923); JEAN DE TRIGON, *Histoire de la littérature enfantine de ma Mère l'Oye au Roi Babar* (1950). (*Italy*): PIERO BARGELLINI, *Canto alle rondini: panorama storico della letteratura infantile,* 6th ed. (1967); GIUSEPPE FANCIULLI, *Scrittori per l'infanzia,* 3rd ed. (1968); LOUISE RESTIEAUX HAWKES, *Before and After Pinocchio: A Study of Italian Children's Books* (1933). (*Spain*): CARMEN BRAVO VILLASANTE (ed.), *Historia de la literatura infantil española* (1963). (*Latin America*): CARMEN BRAVO VILLASANTE, *Historia y antología de la literatura infantil iberoamericana,* 2 vol. (1966); DORA PASTORIZA DE ETCHEBARNE, *El cuento en la literatura infantil, ensayo crítico* (1962).

General: RICHARD BAMBERGER, *Jugendlektüre,* 2nd ed. (1965); ELEANOR CAMERON, *The Green and Burning Tree: On the Writing and Enjoyment of Children's Books* (1969); KORNEI CHUKOVSKY, *From Two to Five,* rev. ed. (1968; Eng. trans. of the 20th Russian ed. of 1968); HANS CORNIOLEY, *Beiträge zur Jugendbuchkunde* (1966); MARGERY FISHER, *Intent upon Reading: A Critical Appraisal of Modern Fiction for Children* (1961); PAUL HAZARD, *Les Livres, les enfants et les hommes* (1932; Eng. trans., *Books, Children and Men,* 4th ed., 1960); ENZO PETRINI, *Avviamento critico alla letteratura giovanile* (1958); LILLIAN H. SMITH, *The Unreluctant Years: A Critical Approach to Children's Literature* (1953); DOROTHY M. WHITE, *Books Before Five* (1954); KAY E. VANDERGRIFT, *Child and Story* (1981).

Bibliographic: VIRGINIA HAVILAND, *Children's Literature: A Guide to Reference Sources* (1966); ANNE PELLOWSKI, *The World of Children's Literature* (1968).

Biographical: BRIAN DOYLE (ed.), *The Who's Who of Children's Literature* (1968); MURIEL FULLER (ed.), *More Junior Authors* (1963); STANLEY J. KUNITZ and HOWARD HAYCRAFT (eds.), *The Junior Book of Authors,* 2nd ed. rev. (1951).

Illustration: BETTINA HURLIMANN, *Die Welt im Bilderbuch* (1965; Eng. trans., *Picture-Book World,* 1968); LEE KINGMAN, JOANNA FOSTER, and RUTH GILES LONTOFT (comps.), *Illustrators of Children's Books: 1957–1966* (1968); DIANA KLEMIN, *The Art of Art for Children's Books: A Contemporary Survey* (1966); BERTHA E. MAHONY *et al.* (comps.), *Illustrators of Children's Books 1744–1945* (1947); BERTHA MAHONY MILLER *et al.* (comps.), *Illustrators of Children's Books, 1946–1956* (1958).

The History of Western Literature

Diverse as they are, European literatures, like European languages, are parts of a common heritage. Greek, Latin, Germanic, Baltic and Slavic, Celtic, and Romance languages are all members of the Indo-European family. (Finnish and Hungarian and Semitic languages of the eastern Mediterranean, such as Hebrew, are not Indo-European. Literatures in these languages are, however, closely associated with major Western literatures and are often included among them.) The common literary heritage is essentially that originating in ancient Greece and Rome. It was preserved, transformed, and spread by Christianity and thus transmitted to the vernacular languages of the European Continent, the Western Hemisphere, and other regions that were settled by Europeans. To the present day, this body of writing displays a unity in its main features that sets it apart from the literatures of the rest of the world. Such common characteristics are considered here.

For specific information about the major national literatures or literary traditions of the West, see such *Macropædia* articles as AMERICAN LITERATURE; ENGLISH LITERATURE; GERMAN LITERATURE; GREEK LITERATURE; LATIN-AMERICAN LITERATURE; and SCANDINAVIAN LITERATURE. Various other Western literatures—including those in the Armenian, Bulgarian, Estonian, Lithuanian, and Romanian languages—are treated in separate entries of the *Micropædia*.

For coverage of related topics in the *Macropædia* and *Micropædia*, see the *Propædia*, Part Six, Division II, Section 621.

The article is divided into the following sections:

ANCIENT LITERATURE

The stark fact about ancient Western literature is that the greater part of it has perished. Some of it had been forgotten before it was possible to commit it to writing; fire, war, and the ravages of time have robbed posterity of most of the rest; and the restitutions that archaeologists and paleographers achieve from time to time are small. Yet surviving writings in Greek and far more in Latin have included those that on ancient testimony marked the heights reached by the creative imagination and intellect of the ancient world.

Five ancient civilizations, Babylon and Assyria, Egypt, Greece, Rome, and the culture of the Israelites in Palestine, each came into contact with one or more of the others. The two most ancient, Assyro-Babylonia, with its broken clay tablets, and Egypt, with its rotted papyrus rolls, make no direct literary signal to the modern age; yet Babylon produced the first full code of laws and two epics of archetypal myth, which came to be echoed and re-echoed in distant lands, and Egypt's mystical intuition of a supernatural world caught the imagination of the Greeks and Romans. Hebrew culture exerted its greatest literary influence on the West because of the place held by its early writings as the Old Testament of the Christian Bible; and this literature profoundly influenced Western consciousness through translation from about the time of St. Augustine onward into every vernacular language as well as into Latin. Until then, Judaism's concentrated spirituality set it apart from the Greek and Roman world.

Though influenced by the religious myths of Mesopotamia, Asia Minor, and Egypt, Greek literature has no direct literary ancestry and appears as self-originated. Roman writers looked to Greek precept for themes, treatment, and choice of verse and metre. Rome eventually passed the torch on to the early Middle Ages, by which time Greek had been subsumed under a wholly Latin tradition and was only rediscovered in its own right at the Renaissance—the "classical" tradition afterward becoming a threat to natural literary development, particularly when certain critics of the 17th century began to insist that the subjects and style of contemporary writing should conform with those employed by Greece and Rome.

All of the chief kinds of literature—epic, tragedy, comedy, lyric, satire, history, biography, and prose narrative—were established by the Greeks and Romans, and later developments have for the most part been secondary extensions. The Greek epic of Homer was the model for the Latin of Virgil; the lyric fragments of Alcaeus and Sappho were echoed in the work of Catullus and Ovid; the history of Thucydides was succeeded by that of Livy and Tacitus; but the tragedy of the great Athenians of the 5th century BC had no worthy counterpart in Roman Seneca nor had the philosophical writings of Plato and Aristotle in those of any ancient Roman, for the practical Romans were not philosophers. Whereas Greek writers excelled in abstraction, the Romans had an unusually concrete vision and, as their art of portraiture shows, were intensely interested in human individuality.

In sum, the work of these writers and others and perhaps especially that of Greek authors expresses the imaginative and moral temper of Western man. It has helped to create his values and to hand on a tradition to distant generations. Homer's epics extend their concern from the right treatment of strangers to behaviour in situations of deep involvement among hero rivals, their foes, and the overseeing gods; the tragedies of Aeschylus and Sophocles are a sublime expression of man's breakthrough into moral awareness of his situation. Among Roman authors an elevated Stoicism stressing the sense of duty is common to many, from Naevius, Ennius, and Cato to Virgil, Horace, and Seneca. A human ideal is to be seen in the savage satire of Juvenal and in Anacreon's songs of love and wine, as it is in the philosophical thought of Plato and Aristotle. It is given voice by a chorus of Sophocles, "Wonders are many, but none is more wonderful than man, the power that crosses the white sea. . . ." The human ideal held up in Greek and Latin literature, formed after civilization had emerged from earlier centuries of barbarism, was to be transformed, before the ancient world came to its close, into the spiritual ideal of Judeo-Christianity, whose writers foreshadowed medieval literature.

MEDIEVAL LITERATURE

Medieval, "belonging to the Middle Ages," is used here to refer to the literature of Europe and the eastern Mediterranean from as early as the establishment of the Eastern Roman, or Byzantine, Empire about AD 300 for medieval Greek, from the period following upon the fall of Rome in 476 for medieval Latin, and from about the time of Charlemagne and the Carolingian Renaissance he fostered in France (*c.* 800) to the end of the 15th century for most written vernacular literatures.

The establishment of Christianity throughout the territories that had formed the Roman Empire meant that Europe was exposed to and tutored in the systematic approach to life, literature, and religion developed by the early Church Fathers. In the West, the fusion of Christian

and classical philosophy formed the basis of the medieval habit of interpreting life symbolically. Through St. Augustine, Platonic and Christian thought were reconciled: the permanent and uniform order of the Greek universe was given Christian form; nature became sacramental, a symbolic revelation of spiritual truth. Classical literature was invested with this same symbolism; exegetical, or interpretative, methods first applied to the Scriptures were extended as a general principle to classical and secular writings. The allegorical or symbolic approach that found in Virgil a pre-Christian prophet and in the *Aeneid* a narrative of the soul's journey through life to paradise (Rome) belonged to the same tradition as Dante's allegorical conception of himself and his journey in *The Divine Comedy.*

The role of the church in preserving ancient literatures

The church not only established the purpose of literature but preserved it. St. Benedict's monastery at Monte Cassino in Italy was established in 529, and other monastic centres of scholarship followed, particularly after the 6th- and 7th-century Irish missions to the Rhine and Great Britain and the Gothic missions up the Danube. These monasteries were able to preserve the only classical literature available in the West through times when Europe was being raided by Goths, Vandals, Franks, and, later, Norsemen in succession. The classical Latin authors so preserved and the Latin works that continued to be written predominated over vernacular works throughout most of the period. St. Augustine's *City of God,* the Venerable Bede's *Ecclesiastical History,* the Danish chronicle of Saxo Grammaticus, for example, were all written in Latin, as were most major works in the fields of philosophy, theology, history, and science.

The main literary values of the period are found in vernacular works. The pre-Christian literature of Europe belonged to an oral tradition that was reflected in the *Poetic Edda* and the sagas, or heroic epics, of Iceland, the Anglo-Saxon *Beowulf,* and the German *Song of Hildebrand.* These belonged to a common Germanic alliterative tradition, but all were first recorded by Christian scribes at dates later than the historical events they relate, and the pagan elements they contain were fused with Christian thought and feeling. The mythology of Icelandic literature was echoed in every Germanic language and clearly stemmed from a common European source. Only the Scandinavian texts, however, give a coherent account of the stories and personalities involved. Numerous ballads in different countries also reflect an earlier native tradition of oral recitation. Among the best known of the many genres that arose in medieval vernacular literatures were the romance and the courtly love lyric, both of which combined elements from popular oral traditions with those of more scholarly or refined literature and both derived largely from France. The romance used classical or Arthurian sources in a poetic narrative that replaced the heroic epics of feudal society, such as *The Song of Roland,* with a chivalrous tale of knightly valour. In the romance, complex themes of love, loyalty, and personal integrity were united with a quest for spiritual truth, an amalgam that was represented in every major western European literature of the time. The love lyric has had a similarly heterogeneous background. The precise origins of courtly love are disputed, as is the influence of a popular love poetry tradition; it is clear, however, that the idealized lady and languishing suitor of the poets of southern and northern France were imitated or reinterpreted throughout Europe—in the Sicilian school of Italy, the minnesingers (love poets) of Germany, and in a Latin verse collection, *Carmina Burana.*

Medieval drama began in the religious ceremonies that took place in church on important dates in the Christian calendar. The dramatic quality of the religious service lent itself to elaboration that perhaps first took the form of gestures and mime and later developed into dramatic interpolations on events or figures in the religious service. This elaboration increased until drama became a secular affair performed on stages or carts in town streets or open spaces. The players were guild craftsmen or professional actors and were hired by towns to perform at local or religious festivals. Three types of play developed: the mystery, the miracle, and the morality. The titles and themes of medieval drama remained religious but their pieces' titles can belie their humorous or farcical and sometimes bawdy nature. One of the best known morality plays was translated from Dutch to be known in English as *Everyman.* A large majority of medieval literature was anonymous and not easily dated. Some of the greatest figures—Dante, Chaucer, Petrarch, and Boccaccio—came late in the period, and their work convincingly demonstrates the transitional nature of the best of medieval literature, for, in being master commentators of the medieval scene, they simultaneously announced the great themes and forms of Renaissance literature.

THE RENAISSANCE

The name Renaissance ("Rebirth") is given to the historical period in Europe that succeeded the Middle Ages. The awakening of a new spirit of intellectual and artistic inquiry, which was the dominant feature of this political, religious, and philosophical phenomenon, was essentially a revival of the spirit of ancient Greece and Rome; in literature this meant a new interest in and analysis of the great classical writers. Scholars searched for and translated "lost" ancient texts, whose dissemination was much helped by developments in printing in Europe from about 1450.

Art and literature in the Renaissance reached a level unattained in any previous period. The age was marked by three principal characteristics: first, the new interest in learning, mirrored by the classical scholars known as humanists and instrumental in providing suitable classical models for the new writers; second, the new form of Christianity, initiated by the Protestant Reformation led by Martin Luther, which drew men's attention to the individual and his inner experiences and stimulated a response in Catholic countries summarized by the term Counter-Reformation; third, the voyages of the great explorers that culminated in Christopher Columbus' discovery of America in 1492 and that had far-reaching consequences on the countries that developed overseas empires, as well as on the imaginations and consciences of the most gifted writers of the day.

To these may be added many other factors, such as the developments in science and astronomy and the political condition of Italy in the late 15th century. The new freedom and spirit of inquiry in the Italian city-states had been a factor in encouraging the great precursors of the Renaissance in Italy, Dante, Petrarch, and Boccaccio. The flowering of the Renaissance in France appeared both in the poetry of the poets making up the group known as the Pléiade and in the reflective essays of Michel de Montaigne, while Spain at this time produced its greatest novelist, Miguel de Cervantes. Another figure who stood out above his contemporaries was the Portuguese epic poet Luís Camões, while drama flourished in both Spain and Portugal, being represented at its best by Lope de Vega and Gil Vicente. In England, too, drama dominated the age, a blend of Renaissance learning and native tradition lending extraordinary vitality to works of Christopher Marlowe, Ben Jonson, John Webster, and others, while Shakespeare, England's greatest dramatic and poetic talent, massively spanned the end of the 16th century and the beginning of the 17th.

In the 16th century the Dutch scholar Desiderius Erasmus typified the development of humanism, which embodied the spirit of critical inquiry, regard for classical learning, intolerance of superstition, and high respect for men as God's most intricate creation. An aspect of the influence of the Protestant Reformation on literature was the number of great translations of the Bible, including an early one by Erasmus, into vernacular languages during this period, setting new standards for prose writing. The impetus of the Renaissance carried well into the 17th century, when John Milton reflected the spirit of Christian humanism.

THE 17TH CENTURY

The 17th century was a period of unceasing disturbance and violent storms, no less in literature than in politics and society. The Renaissance had prepared a receptive environment essential to the dissemination of the ideas of the new science and philosophy. The great question of the

century, which confronted serious writers from Donne to Dryden, was Michel de Montaigne's "What do I know?" or, in expanded terms, the ascertainment of the grounds and relations of knowledge, faith, reason, and authority in religion, metaphysics, ethics, politics, economics, and natural science.

The questioning attitude that characterized the period is seen in the works of its great scientists and philosophers: Descartes's *Discourse on Method* (1637) and Pascal's *Pensées* (written 1657–58) in France; Bacon's *Advancement of Learning* (1605) and Hobbes's *Leviathan* (1651) in England. The importance of these works has lain in their application of a skeptical, rationalist mode of thought not only to scientific problems but to political and theological controversy and general problems of understanding and perception. This fundamental challenge to both thought and language had profound repercussions in man's picture of himself and was reflected in what T.S. Eliot described as "the dissociation of sensibility," which Eliot claimed took root in England after the Civil War, whereby, in contrast to the Elizabethan and Jacobean writers who could "devour any kind of experience," later poets in English could not think and feel in a unified way.

The effects of war on 17th-century literature

A true picture of the period must also take into account the enormous effect of social and political upheavals during the early and middle parts of the century. In England, where the literary history of the period is usually divided into two parts, the break seems to fall naturally with the outbreak of the Civil War (1642–51), marked by a closure of the theatres in 1642, and a new age beginning with the restoration of the monarchy in 1660. In France the bitter internecine struggle of the Fronde (1648–53) similarly divided the century and preceded possibly the greatest period of all French literature—the age of Molière, Racine, Boileau, and La Fontaine. In Germany the early part of the century was dominated by the religious and political conflicts of the Thirty Years' War (1618–48) and thereafter by the attempts of German princes to emulate the central power and splendour of Louis XIV's French court at Versailles. The Netherlands was also involved in the first part of the century in a struggle for independence from Spain (the Eighty Years' War, 1568–1648) that resulted not only in the achievement of this but also in the "Golden Age" of Dutch poetry—that of Henric Spieghel, Daniël Heinsius, and Gerbrand Bredero.

The civil, political, and religious conflicts that dominated the first half of the century were in many ways also the characteristic response of the Counter-Reformation. The pattern of religious conflict was reflected in literary forms and preoccupations. One reaction to this—seen particularly in Italy, Germany, and Spain but also in France and England—was the development of a style in art and literature known as Baroque. This development manifested itself most characteristically in the works of

Baroque literature

Giambattista Marino in Italy, Luis de Góngora in Spain, and Martin Opitz in Germany. Long regarded by many critics as decadent, Baroque literature is now viewed in a more favourable light and is understood to denote a style the chief characteristics of which are elaboration and ornament, the use of allegory, rhetoric, and daring artifice.

If Baroque literature was the characteristic product of Italy and Germany in this period, Metaphysical poetry was the most outstanding feature in English verse of the first half of the century. This term, first applied by Dryden to John Donne and expanded by Dr. Johnson, is now used to denote a range of poets who varied greatly in their individual styles but who possessed certain affinities with Baroque literature, especially in the case of Richard Crashaw.

Perhaps the most characteristic of all the disputes of the 17th century was that in which the tendency to continue to develop the Renaissance imitation of the classics came

The conflict between the classics and the new science

into conflict with the aspirations and discoveries of new thinkers in science and philosophy and new experimenters with literary forms. In France this appeared in a struggle between the Ancients and Moderns, between those who thought that literary style and subject should be modeled on classical Greek and Latin literature and supporters of native tradition. In Spain a similar conflict was expressed in a tendency toward ornament, Latinization, and the classics (*culteranismo*) and that toward a more concise, profound, and epigrammatic style (*conceptismo*). This conflict heralded through the Moderns in France and the idea of *conceptismo* in Spain a style of prose writing suitable to the new age of science and exploration. The Moderns in France were largely, therefore, followers of Descartes. In England a similar tendency was to be found in the work of the Royal Society in encouraging a simple language, a closer, naked, natural way of speaking, suitable for rational discourse, paralleled by the great achievements in prose of John Milton and John Dryden.

THE 18TH CENTURY

To call the 18th century the Age of Reason is to seize on a useful half-truth but to cause confusion in the general picture, because the primacy of reason had also been a mark of certain periods of the previous age. It is more accurate to say that the 18th century was marked by two main impulses: reason and passion. The respect paid to reason was shown in pursuit of order, symmetry, decorum, and scientific knowledge; the cultivation of the feelings stimulated philanthropy, exaltation of personal relationships, religious fervour, and the cult of sentiment, or sensibility. In literature the rational impulse fostered satire, argument, wit, plain prose; the other inspired the psychological novel and the poetry of the sublime.

The cult of wit, satire, and argument is evident in England in the writings of Alexander Pope, Jonathan Swift, and Samuel Johnson, continuing the tradition of Dryden from the 17th century. The novel was established as a major art form in English literature partly by a rational realism shown in the works of Henry Fielding, Daniel Defoe, and Tobias Smollett and partly by the psychological probing of the novels of Samuel Richardson and of Laurence Sterne's *Tristram Shandy*. In France the major characteristic of the period lies in the philosophical and political writings of the Enlightenment, which had a profound influence throughout the rest of Europe and foreshadowed the French Revolution. Voltaire, Jean-Jacques Rousseau, Charles de Montesquieu, and the Encyclopédistes Denis Diderot and Jean d'Alembert all devoted much of their writing to controversies about social and religious matters, often involving direct conflict with the authorities. In the first part of the century, German literature looked to English and French models, although innovative advances were made by the dramatist and critic Gotthold Ephraim Lessing. The great epoch of German literature came at the end of the century, when cultivation of the feelings and of emotional grandeur found its most powerful expression in what came to be called the *Sturm und Drang* ("Storm and Stress") movement. Associated with this were two of the greatest names of German literature, Johann Wolfgang von Goethe and Friedrich Schiller, both of whom in drama and poetry advanced far beyond the turbulence of *Sturm und Drang*.

THE 19TH CENTURY

The 19th century in Western literature—one of the most vital and interesting periods of all—has special interest as the formative era from which many modern literary conditions and tendencies derived. Influences that had their origins or were in development in this period—Romanticism, Symbolism, Realism—are reflected in the current of modern literature, and many social and economic characteristics of the 20th century were determined in the 19th.

Romanticism. The predominant literary movement of the early part of the 19th century was Romanticism, which in literature had its origins in the *Sturm und Drang* period in Germany. An awareness of this first phase of Romanticism is an important correction to the usual idea of Romantic literature as something that began in English poetry with William Wordsworth and Samuel Taylor Coleridge and the publication of *Lyrical Ballads* in 1798. Moreover, although it is true that the French Revolution of 1789 and the Industrial Revolution were two main political and social factors affecting the Romantic poets of early 19th-century England, many characteristics of Romanticism in literature sprang from literary or philosophical sources. A

philosophical background was provided in the 18th century chiefly by Jean-Jacques Rousseau, whose emphasis on the individual and the power of inspiration influenced Wordsworth and also such first-phase Romantic writers as Friedrich Hölderlin and Ludwig Tieck in Germany and the French writer Bernardin de Saint-Pierre, whose *Paul et Virginie* (1787) anticipated some of the sentimental excesses of 19th-century Romantic literature. Positive as it was, the influence of Rousseau must also be seen as a partly negative reaction against 18th-century rationalism with its emphasis on intellect.

Belief in self-knowledge was, indeed, a principal article of Romantic faith. Late 18th-century French writers such as Fabre d'Olivet sought to explain the physical world by an idea of a "breath of life" similar to the "inspiration" of Wordsworth and Coleridge. The Romantics believed that the real truth of things could be explained only through examination of their own emotions in the context of nature and the primitive. Because of this emphasis on inspiration, the poet came to assume a central role—that of seer and visionary. Simultaneously, such formal conventions as imitation of the classics were rejected as binding rules. A new directness of the poet's role emphasized the language of the heart and of ordinary men, and Wordsworth even tried to invent a new simplified diction. Poetry became divorced from its 18th-century social context, and a poet was answerable only to ultimate truth and himself. Two classic poses of the Romantic poet were the mystic visionary of John Keats and the superman of Lord Byron—indeed, satirization of the Byronic hero was to become a theme of later novelists such as Fyodor Dostoyevsky, even though he himself had Romantic antecedents.

The fact that Dostoyevsky was a Russian showed how the Romantic stream flowed across Europe. In Spain and Italy, Hungary, Poland, and the Balkans, it took the form of drama, which in England failed to produce great works. The early and middle 19th century was a time of poetry and prose rather than of drama. The Romantic style in poetry was seen everywhere in Europe—in José de Espronceda in Spain; Ugo Foscolo and Giacomo Leopardi in Italy, where it became identified with nationalist sentiments; Aleksandr Pushkin and Mikhail Lermontov in Russia; Adam Mickiewicz in Poland. In America, a Romantic thread also allied with the emergence of national feeling could be seen in the adventurous stories of James Fenimore Cooper; in the supernatural and mystic element in Edgar Allan Poe; in the poetry of Walt Whitman and Henry Wadsworth Longfellow; and in the Transcendentalist theories of Ralph Waldo Emerson and Henry David Thoreau, which, as Wordsworth's pronouncements had done, affirmed the power of "insight" to transcend ordinary logic and experience.

The impetus of Romantic poetry began to slacken after about 1830 and gave way to more objective styles, although many of its themes and devices, such as the misunderstood artist or the unhappy lover, continued to be employed.

Post-Romanticism. Arguably the first post-Romantic poet was a German, Heinrich Heine, but German poetry in the mid-19th century mostly followed Wordsworth, though new tendencies were to be found in August von Platen Hallermünde and an Austrian, Nikolaus Lenau. The principal development was to be seen in France in the growth of a movement known as Parnassianism. Originating with Théophile Gautier, Parnassianism in some ways was an offshoot of Romanticism rather than a reaction against it. In concentrating on the purely formal elements of poetry, on aesthetics, and on "art for art's sake," it changed the direction of French poetry and had much influence abroad. Its most illustrious representative was Charles Baudelaire, who believed that "everything that is not art is ugly and useless." Another branch of new development was the growth of Impressionism and the Symbolist movement, a result of "borrowing" from movements in painting, sculpture, and music. Paul Verlaine, foremost of the Impressionists, used suggestion, atmosphere, and fleeting rhythms to achieve his effects. Symbolism, a selective use of words and images to evoke tenuous moods and meanings, is conveyed in the work of Stéphane Mallarmé and Arthur Rimbaud. The advance of French poetry in the middle and later part of the century was an achievement of individuals, based on invention of a personal idiom.

Impressionism and Symbolism

The spread of education and, in England, of circulating libraries increased a demand for novels. At the beginning of the 19th century Jane Austen had already satirized the excesses of the Gothic novel, a harbinger of medievalizing Romanticism in the latter part of the 18th century, in *Northanger Abbey* and the conflict of sense and Romantic sensibility in *Sense and Sensibility*. In France the conflict of intelligence and emotion appeared in the work of Benjamin Constant (*Adolphe,* 1816) and most notably in *Le Rouge et le noir* (1830) of Stendhal and later in Gustave Flaubert's *Madame Bovary* (1857). The detailed verbal scrupulousness and Realism exhibited in the work of Flaubert and of Honoré de Balzac were carried forward by Guy de Maupassant in France and Giovanni Verga in Italy; they culminated in the extreme Naturalism of Émile Zola, who described his prose in novels such as *Thérèse Raquin* (1867) as "literary surgical autopsy."

But Realism and nationalism seem irrelevant as descriptions of the great writers of the period—for example, George Eliot, Charles Dickens, and Thomas Hardy in England and Nikolay Gogol, Ivan Turgenev, Leo Tolstoy, Fyodor Dostoyevsky, and Anton Chekhov in Russia. In such writers there was a distinct bias toward literature with a social purpose, stimulated by awakening forces of liberalism, humanism, and socialism in many Western countries.

A decline of the Romantic theatre into melodrama was fairly general in Europe, and it was slower than the novel to take up problems of contemporary life. When revival came, through the work of a Norwegian, Henrik Ibsen, Romantic conflicts of visionary and realist, individual and society were restated, and this was true also of the plays of August Strindberg in Sweden. In Russia a modern theatre became a vital influence that could trace its beginnings back to Gogol's *Government Inspector* (1836) but was to be felt later in the century in Turgenev's *Month in the Country* (1850) and, above all, in the work of Anton Chekhov, a great dramatist of the period.

THE 20TH CENTURY

When the 20th century began, social and cultural conditions that prevailed in Europe and America were not too different from those of the middle and late 19th century. Continuity could be seen, for example, in the work of four novelists writing in English at the turn of the century and after. Joseph Conrad, Thomas Hardy, Henry James, and D.H. Lawrence all demonstrated in the progress of their work the transition from a relatively stable world at the end of the 19th century to a new age that began with World War I. The awakening of a new consciousness in literature was also to be traced in such works of fiction as the first volume of Marcel Proust's *Remembrance of Things Past* (*Swann's Way*, 1913), André Gide's *Vatican Cellars* (1914), James Joyce's *Ulysses* (1922), Franz Kafka's *Trial* (published posthumously in 1925), and Thomas Mann's *Magic Mountain* (1924).

Various influences that characterized much of the writing from the 1920s were at work in these writers. An interest in the unconscious and the irrational was reflected in their work and that of others of about this time. Two important sources of this influence were Friedrich Nietzsche, a German philosopher to whom both Gide and Mann, for example, were much indebted, and Sigmund Freud, whose psychoanalytical works, by the 1920s, had had a telling influence on Western intellectuals. A shift away from 19th-century assumptions and styles was not limited to writers of fiction. André Breton's first *Manifeste du surréalisme* (1924; "Manifesto of Surrealism") was the first formal statement of a movement that called for spontaneity and a complete rupture with tradition. Surrealism showed the influence of Freud in its emphasis on dreams, automatic writing, and other antilogical methods and, although short-lived as a formal movement, had a lasting effect on much 20th-century art and poetry. The uncertainty of the new age and the variety of attempts to deal with it and give it

The influence of Nietzsche and Freud

some artistic coherence can be seen also in Rainer Maria Rilke's *Duino Elegies* and *Sonnets to Orpheus* (1923); in T.S. Eliot's *Waste Land* (1922); and in Luigi Pirandello's play about the instability of identity, *Henry IV* (1922).

The international and experimental period of Western literature in the 1910s and 1920s was important not only for the great works it produced but also because it set a pattern for the future. What was clearly revealed in the major works of the period was an increasing sense of crisis and urgency, doubts as to the 19th century's faith in the psychological stability of the individual personality, and a deep questioning of all philosophical or religious solutions to human problems. In the 1930s these qualities of 20th-century thought were not abandoned but, rather, were expanded into a political context, as writers divided into those supporting political commitment in their writing and those reacting conservatively against such a domination of art by politics. Nor did World War II resolve the debate concerning political commitment—issues similar to those that exercised major creative imaginations of the 1930s were still very much alive during the last quarter of the century.

The scarcity of great writers after World War II

It would be tempting to explain what seemed to be a relative scarcity of great writers in the period after World War II as an inevitable result of the cumulative pressure of disturbing social and technological developments accelerated by that war. Under such fluctuating and doubtful circumstances, it would not seem altogether strange if writing and reading, as traditionally understood, should cease. Indeed, in certain technologically highly developed countries, such as the United States, the printed word itself seemed to some critics to have lost its central position, having been displaced in the popular mind by a visual and aural electronic culture that did not need the active intellectual participation of its audience. Thus the communications media that helped to create something resembling an international popular culture in many Western countries did nothing to make the question of literary value easier to answer. Given the extraordinary conditions in which a modern writer works, it was not surprising that reputations were difficult to judge, that radical experimentation characterized many fields of literature, and that traditional forms of writing were losing their definition and were tending to dissolve into one another. Novels might acquire many features of poetry or be transformed into a kind of heightened nonfictional reportage, while experimentation with typography gave poems an appearance of verbal paintings, and dramatic works, shorn of anything resembling a traditional plot, became a series of carefully orchestrated gestures or events. But formal experimentation was only part of the picture, and to say that modern writing since World War II has been primarily experimental would be to ignore other characteristics that writing acquired earlier in the century and that still continued to be issues. Most good critics felt that there was no lack of good literature being written, despite the lack of major reputations and despite the possibly transitional nature of much of the period's work in its variety of styles and subjects.

BIBLIOGRAPHY

General introductory works: FERNAND BALDENSPERGER and WERNER P. FRIEDERICH, *Bibliography of Comparative Literature* (1950, reprinted 1960), comprehensive coverage of literatures, classified by author, country, and according to genre, theme, etc.; ANTONY BRETT-JAMES, *The Triple Stream: Four Centuries of English, French, and German Literature, 1531–1930* (1953, reprinted 1977), contains useful comparative tables arranged chronologically; JOHN M. COHEN, *A History of Western Literature*, rev. ed. (1963), a useful factual and critical account; JEAN-ALBERT BEDE and WILLIAM B. EDGERTON (gen. eds.), *Columbia Dictionary of Modern European Literature*, 2nd ed. (1980), contains over 1,800 articles, including surveys, critical essays, and biographies, with bibliographies; WILLIAM F. THRALL and ADDISON HIBBARD, *A Handbook to Literature*, 4th ed. by C. HUGH HOLMAN (1980), good coverage of literary terms and movements; RENE WELLEK, *A History of Modern Criticism: 1750–1950*, 4 vol. (1955–), surveys theory in the major European nations since the Renaissance.

Ancient period: JULIUS A. BEWER, *The Literature of the Old Testament in Its Historical Development*, 3rd ed. (1962); SIR PAUL HARVEY (ed.), *The Oxford Companion to Classical Literature* (1937, reprinted with corrections 1969), a basic reference work; MAURICE PLATNAUER (ed.), *Fifty Years of Classical Scholarship* (1954), contains valuable bibliographies; C.M. BOWRA, *Landmarks in Greek Literature* (1966); ROBERT FLACELIERE, *Histoire littéraire de la Grèce* (1962; Eng. trans., *A Literary History of Greece*, 1964), a systematic, readable survey of ancient literature; KENNETH J. DOVER *et al.*, *Ancient Greek Literature* (1980); HERBERT J. ROSE, *A Handbook of Greek Literature from Homer to the Age of Lucian*, 4th ed. rev. (1961); and *A Handbook of Latin Literature from the Earliest Times to the Death of St. Augustine*, 3rd ed. (1954, reprinted with suppl. bibliog. 1966), two standard works; MICHAEL GRANT, *Roman Literature* (1954), a good short account; WILLIAM A. LAIDLAW, *Latin Literature* (1951), a useful introduction; JOHN WIGHT DUFF, *A Literary History of Rome*, 2nd–3rd ed., 2 vol., ed. by A.M. DUFF (1960–64, 3rd ed. reprinted 1979), standard introduction containing comprehensive and scholarly surveys, with supplementary bibliographies.

The Middle Ages: H.M. CHADWICK, *The Heroic Age* (1912, reprinted 1974), a comparative study covering Greek, Teutonic, Slavonic, and Celtic literatures and cultures; E.K. CHAMBERS, *The Mediaeval Stage*, 2 vol. (1903), a standard reference work; W.T.H. JACKSON, *The Literature of the Middle Ages* (1960), and (ed.), *The Interpretation of Medieval Lyric Poetry* (1980); CHARLES W. JONES (ed.), *Medieval Literature in Translation* (1950), a good, readable anthology; C.S. LEWIS, *The Allegory of Love* (1936, reprinted 1958), a critical study of courtly love in medieval literature; ROGER S. LOOMIS (ed.), *Arthurian Literature in the Middle Ages* (1959), an excellent survey.

The Renaissance: ERNST CASSIRER, PAUL O. KRISTELLER, and JOHN H. RANDALL (eds.), *The Renaissance Philosophy of Man* (1948), a collection of excerpts from the writings of Renaissance philosophers; JOSEPH A. MAZZEO, *Renaissance and Revolution: The Remaking of European Thought* (1966), useful background reading; HENRY O. TAYLOR, *Thought and Expression in the Sixteenth Century*, 2nd rev. ed., 2 vol. (1959), a good standard work.

The 17th century: MARIO PRAZ, *Studi sul concettismo*, 2 vol. (1934–46; Eng. trans., *Studies in Seventeenth-Century Imagery*, 2 vol., 1939–48), a standard and readable work; JOEL E. SPINGARN (ed.), *Critical Essays of the Seventeenth Century*, 3 vol. (1909, reprinted 1957), a valuable collection.

HALSTED (ed.), *Romanticism* (1969), a collection of extracts and key essays by the leading figures of western European Romanticism, with a long introduction and chronological table; PAUL HAZARD, *La Pensée européenne au XVIII^e siècle* (1963; Eng. trans., *European Thought in the Eighteenth Century*, 1963); DANIEL MORNET, *The Development of Literature and Culture in the XVIIIth Century* (1954), an extensive survey; MARIO PRAZ, *La carne, la morte e il diavolo nella letteratura romantica* (1930; 5th ed., 1976; Eng. trans., *The Romantic Agony*, 2nd ed., 1951; reissued with corrections, 1970), a remarkable work, now a classic in this field; JOHN G. ROBERTSON, *Studies in the Genesis of Romantic Theory in the Eighteenth Century* (1923, reprinted 1962).

The 19th century: GEORG BRANDES, *Creative Spirits of the Nineteenth Century* (1923, reprinted 1967); BENEDETTO CROCE, *Poesia e non poesia*, 7th ed. (1964; Eng. trans., *European Literature in the Nineteenth Century*, 1924, reprinted 1967); JANKO LAVRIN, *Aspects of Modernism: From Wilde to Pirandello* (1935, reprinted 1968); JOHN LUCAS (ed.), *Literature and Politics in the Nineteenth Century* (1971).

The 20th century: ERICH AUERBACH, *Mimesis* (1946; Eng. trans. 1953), traces the development of Realism from ancient to modern times; CLEANTH BROOKS and ROBERT PENN WARREN (eds.), *Understanding Poetry*, 4th ed. (1976), and *Understanding Fiction*, 3rd ed. (1979); and CLEANTH BROOKS and ROBERT B. HEILMAN, *Understanding Drama*, rev. ed. (1948), detailed anthologies, with explications of texts—invaluable introductions, especially to the study of modern writing, though not limited to 20th-century literature; GYORGY LUKACS, *Studies in European Realism* (1950, reprinted 1972), an important work by a major Marxist critic; RENE WELLEK and AUSTIN WARREN, *Theory of Literature*, 3rd ed. rev. (1970), a general and theoretical work, especially useful as a guide to modern literature; CLAUDE MAURIAC, *L'Alittérature contemporaine* (1958; Eng. trans., *The New Literature*, 1959); STEPHEN SPENDER, *The Struggle of the Modern* (1963) and *The Thirties and After* (1978); EDMUND WILSON, *Axel's Castle* (1931), *The Triple Thinkers*, rev. ed. (1948, reprinted 1977), and *The Twenties: From Notebooks and Diaries of the Period*, ed. by LEON EDEL (1975).

(Ed.)

Locke

The English philosopher John Locke was an initiator of the Enlightenment in England and France, an inspirer of the U.S. Constitution, and the author of, among other works, *An Essay Concerning Human Understanding,* his account of human knowledge, including the "new science" of his day—*i.e.,* modern science.

Locke, oil painting by Sir Godfrey Kneller. In Christ Church, Oxford.

THE LIFE OF JOHN LOCKE

Early years. Locke was born in Wrington, Somerset, on Aug. 29, 1632, and reared in Pensford, six miles south of Bristol. His family was Anglican with Puritan leanings. His father, a country attorney of modest means, fought on the Parliamentarian side in the Civil War—a fact that later helped him to find a place for his son in Westminster School, then controlled by a Parliamentarian committee (though its headmaster, Richard Busby, was a Royalist). The training there was thorough, but Locke later complained of the severity of its discipline. In 1652 he entered Christ Church, Oxford. Puritan reforms at Oxford had not yet altered the traditional Scholastic curriculum of rhetoric, grammar, moral philosophy, geometry, and Greek; Locke found the course insipid and interested himself in studies outside the traditional program, particularly experimental science and medicine. He was graduated with a B.A. degree in 1656 and an M.A. two years later, around which time he was elected a student (the equivalent of fellow) of Christ Church. In 1660, as a newly appointed tutor in his college, Locke enthusiastically welcomed the end of the Puritan Commonwealth and the restoration of Charles II to the throne.

Student years

In 1661 Locke inherited a portion of his father's estate, which ensured a modest annual income. His studentship would eventually be subject to termination unless he took holy orders, which he declined to do. Not wishing to make teaching his permanent vocation, he taught undergraduates for four years only. He served as secretary to a diplomatic mission to Brandenburg in 1665, and on his return he was immediately offered, but refused, another diplomatic post. His papers of this period, his correspondence, and his commonplace books all testify to his chief interests at the time, viz., natural science, on the one hand, and the study of the underlying principles of moral, social, and political life, on the other. To remedy the narrowness of his education he read contemporary philosophy, particularly that of René Descartes, the father of modern philosophy. But more than all, experimental science engaged his interest. He collaborated with Robert Boyle, one of the founders of modern chemistry, who was a close friend, and, toward the end of the period, with another friend, Thomas Sydenham, an eminent medical scientist.

Association with Shaftesbury. It was as a physician that Locke first came to the notice of the statesman Lord Ashley (later to become the 1st earl of Shaftesbury). On a visit to Oxford in the summer of 1666, Lord Ashley required some medical attention and was introduced to Locke by a mutual acquaintance; the two immediately became friends. A royal mandate of that November secured Locke's studentship indefinitely. The following year, despite his having no medical degree and no desire to practice medicine, he joined Ashley's household at Exeter House in the Strand in London as family physician. He became Ashley's personal adviser not merely on medical matters but on his general affairs as well.

Ashley was a forceful, aggressive politician who had many enemies (some of them men of letters—for instance, Locke's schoolfellow, the poet laureate John Dryden). It is doubtful, however—if only in view of Locke's respect for him—whether Ashley was as evil as his enemies sometimes made him out to be. It is known that he stood firmly for a constitutional monarchy, for a Protestant succession, for civil liberty, for toleration in religion, for the rule of Parliament, and for the economic expansion of Britain; and that he continued to make this stand when many influential men were working against these aims. Since these were already aims to which Locke had dedicated himself, there existed from the first a perfect understanding between the statesman and his adviser, one that meant much to both. Ashley entrusted Locke with the task of negotiating his son's marriage with the daughter of the Earl of Rutland; he also made him secretary of the group that he had formed to increase trade with America, particularly with the southern colonies. Locke helped to draft a constitution for the new colony of Carolina, a document that extended freedom of worship to all colonists, denying admission only to atheists.

Private studies and discussions

During the following decades, Locke persevered in his private studies, and many of his social meetings were in effect meetings with friends to discuss philosophical and scientific problems. As early as 1668 he had become a fellow of the newly formed (1663) Royal Society, which kept him in touch with scientific advances. It is known, too, that groups of friends (Lord Ashley; the physician John Mapletoft; Thomas Sydenham; Sydenham's physician colleague, James Tyrrell, who was also a divine; and others) met in his rooms, for one such meeting is mentioned in the preface of his *Essay Concerning Human Understanding,* in which he reports that, because of the difficulties that beset the participants, they resolved to devote their next meeting to discussing the powers of the mind in order, as they said, "to examine our own abilities and see what objects our understandings were, or were not, fitted to deal with." Locke himself opened the discussion and, following the meeting, set out his view of human knowledge in two drafts (1671), still extant, which show the beginnings of the thinking that 19 years later would blossom into his famous *Essay.* In these London years, too, Locke encountered representatives of Cambridge Platonism, a school of Christian humanists, who, though sympathetic to empirical science, nonetheless opposed materialism because it failed to account for the rational element in human life. They tended to be liberal in both politics and religion. Insofar as they taught a Platonism that rested on belief in innately known Ideas, Locke could not follow them; but their tolerance, their emphasis on practical conduct as a part of the religious life, and their rejection of materialism were features that he found most attractive. This school was closely related in spirit to another school that

influenced Locke at this time, viz., that of latitudinarianism. For the latter school, if a man confessed Christ, that alone should be enough to entitle him to membership in the Christian Church; conformity in nonessentials should not be demanded. These movements prepared Locke for the antidogmatic, liberal school of theology that he would later encounter in Holland, a school in revolt against the narrowness of traditional Calvinism.

In 1672 Ashley was raised to the peerage as the 1st earl of Shaftesbury and at the end of that year was appointed lord high chancellor of England. Though he soon lost favour and was dismissed, he did, while in office, establish the Council of Trade and Plantations, of which Locke was secretary for two years. Locke, however, who suffered greatly from asthma, found the London air and his heavy duties unhealthy, and in 1675 he had to return to Oxford.

Intellectual contacts in France

Six months later he departed for France, where he stayed for four years (1675–79), spending most of his time in Paris and Montpellier. In France during the 1670s, Locke made contacts that deeply influenced his view of metaphysics and epistemology, viz., with the Gassendist school and, particularly, with its leader, François Bernier. Pierre Gassendi, a philosopher and scientist, had rejected overspeculative elements in Descartes's philosophy and had advocated a return to Epicurean doctrines—*i.e.*, to empiricism (stressing sense experience), to hedonism (holding pleasure to be the good), and to corpuscular physics (according to which reality consists of atomic particles). Knowledge of the external world, Gassendi held, depends upon the senses, though it is through reasoning that man may derive much further information from empirically gained evidence.

Upon Locke's return to England, he found the country torn by dissension. The heir to the throne, James (the brother of Charles II), was a Roman Catholic, whom the Protestant majority led by Shaftesbury wished to exclude from the succession. For a year Shaftesbury had been imprisoned in the Tower, but by the time Locke returned he was back in favour once more as lord president of the Privy Council. When he failed, however, to reconcile the interests of the King and Parliament, he was dismissed; in 1681 he was arrested, tried, and finally acquitted by a London jury. A year later he fled to Holland, where, in 1683, he died.

Later life. No one of Shaftesbury's known friends was now safe in Great Britain. Locke himself, who was being closely watched, crossed to Holland in September 1683.

Exile in Holland. Locke's sojourn in Holland was happier than he had expected it to be: his health improved, he made many new friends, and he found the leisure that enabled him to bring his thoughts on many subjects to fruition. Locke spent his first winter in Amsterdam and soon became friendly with a distinguished Arminian theologian, Philip van Limborch, pastor of the Remonstrants' church there—a friendship that lasted until Locke's death. The companionship of Philip and other friends made it easier to bear bad news from home: at Charles II's express command, Locke (in 1684) was deprived of his studentship at Christ Church. The next year his name appeared on a list sent to The Hague that named 84 traitors wanted by the English government. Locke went into hiding for a while but soon was able to move freely over Holland and became familiar with its different provinces.

Return to England and retirement to Oates. Locke remained abroad for more than five years, until James II, who had become king in 1685, was overthrown. In the autumn of 1688, after it was announced that James had been presented with a male heir (and thus a Roman Catholic successor), the King's opponents invited his Protestant nephew and son-in-law, William of Orange in the Netherlands, to seize the throne. The King offered little resistance. Locke himself in February 1689 crossed in the party that accompanied the Princess of Orange, now to be crowned Queen Mary II of England. The triumph was complete; Locke was home again, although not without a nostalgia for the Holland that he had come to love. He now took little part in public life. He refused ambassadorial posts but accepted a membership in the Commission of Appeals. (Much later, in 1696, he was appointed a commissioner in the resuscitated Board of Trade and Plantations, however, and for four years played a leading part in its deliberations.) But the London air again bothered him, and he was forced to leave the city for long visits to his friends in the country. In 1691 he retired to Oates, the house of his friends Sir Francis and Lady Masham in Essex, and subsequently made only occasional visits to London. Nonetheless, he was not without influence in these last years of his life, for he was the intellectual leader of the Whigs. Their principal parliamentarians were frequently old friends of Locke, and the younger generation—particularly the ablest of them all, John Somers, who soon became lord chancellor—turned to him constantly for guidance. In "the glorious, bloodless revolution," the main aims for which Shaftesbury and Locke had fought were achieved—even though in William's reign strong Tory pressures limited the extent of the reform. First and foremost, England became a constitutional monarchy, controlled by Parliament. Second, real advances were made in securing the liberty of subjects in the law courts, in achieving a greater (though far from complete) measure of religious toleration, and in assuring freedom of thought and expression. Locke himself drafted the arguments that his friend Edward Clarke used in the House of Commons in arguing for the repeal of the restrictive Act for the Regulation of Printing. The act was abolished in 1695 and the freedom of the press was secured.

Influence during retirement

Publication of his works. The main task of this last period of his life, however, was the publication of his works, which had been the product of long years of gestation. The *Epistola de Tolerantia* (*A Letter Concerning Toleration*, 1689) was published anonymously at Gouda in 1689. Locke had been reflecting on this topic from his early days at Oxford. Though his correspondence and a paper that he wrote in 1667 show his support for toleration in religion, in 1660–61 he wrote two tracts on this theme (not published until 1967) that are surprisingly conservative. *Two Treatises of Government* (1690) was also the fruit of years of reflection upon the true principles in politics, a reflection resting on Locke's own observations. In all of these social and political issues, Locke saw that the ultimate factor is man's nature. To understand man, however, it is not enough to observe his actions; one must also inquire about his capacities for knowledge. Locke had been conscious of this point in writing his paper on the "Law of Nature" as early as 1663. In 1671, as has been seen, he set out to write a book about human knowledge, *An Essay Concerning Human Understanding*, which was not published, however, until December 1689 (all copies dated 1690)—nor was it wholly completed even then, for Locke made changes, sometimes substantial ones, in three of the four following editions. (See below, *Locke's philosophy*.)

Last years. Locke's last years were spent in the peaceful retreat of Oates. His hostess was a woman with whom he had been acquainted for many years—Lady Masham, or Damaris, the daughter of Ralph Cudworth, one of the Cambridge Platonists, by whom Locke had been significantly influenced. He found friendship and comfort in this household. Many of his friends visited him there: Sir Isaac Newton, who came to discuss the Epistles of St. Paul, a subject of great interest to both; his nephew and heir Peter King, destined to become lord high chancellor of England; and Edward Clarke with his wife and children, for whom Locke had great affection. Locke had written a series of letters to Edward Clarke from Holland, advising him on the best upbringing for his son. These letters formed the basis of his influential *Some Thoughts Concerning Education* (1693), setting forth new ideals in that field. He wrote and published pamphlets on matters of economic interest, on rates of interest, on the coinage of the realm, and, more widely, on trade (defending mercantilist views). In 1695 he published a dignified plea for a less dogmatic Christianity in *The Reasonableness of Christianity*.

Later writings

John Locke died on Oct. 28, 1704, and was buried in the parish church of High Laver. "His death," wrote Lady Masham, "was like his life, truly pious, yet natural, easy and unaffected." This account of his character by one

who knew him well seems singularly appropriate. He was orderly, careful about money, occasionally parsimonious, abstemious, and, though naturally emotional and hot-tempered, controlled and disciplined. He had a great love of children, and friendship was for him a necessity. Both in his books and in his life are found the marks of the prudence and wisdom for which he was famed.

LOCKE'S PHILOSOPHY

Theory of knowledge. Locke was thoroughly suspicious of the view that a thinker could work out by reason alone the truth about the universe. Much as he admired Descartes, he feared this speculative spirit in him, and he despised it in the Scholastic philosophers. In this sense he rejected metaphysics. Knowledge of the world could only be gained by experience and reflection on experience, and this knowledge was being gained by Boyle, Sydenham, Christiaan Huygens, and Newton. They were the true philosophers who were advancing knowledge. Locke set himself the humbler task, as he conceived it, of understanding how this knowledge was gained. What was "the original, certainty, and extent of human knowledge, together with the grounds and degrees of belief, opinion, and assent"?

Empiricism. As for "the original," the answer was plain. Knowledge of the world began in sense perception, and self-knowledge in introspection, or "reflection" in Locke's language. It did not begin in innate knowledge of maxims or general principles, and it did not proceed by syllogistic reasoning from such principles. In the 17th century there had been much vague talk about innate knowledge, and in Book I of his *Essay Concerning Human Understanding* Locke examines this talk and shows its worthlessness. In Book II of his *Essay* he begins by claiming that the sources of all knowledge are sense experience and reflection; these are not themselves, however, instances of knowledge in the strict sense, but they provide the mind with the material of knowledge. Locke calls the material so provided "ideas." Ideas are objects "before the mind," in the sense not that they are physical objects but that they represent them. Locke distinguishes ideas that represent actual qualities of objects (such as size, shape, or weight) from ideas that represent perceived qualities, which do not exist in objects except as they affect observers (such as colour, taste, or smell). Locke designates the former primary qualities and the latter secondary qualities.

Locke proceeds to group and classify the ideas, with a view to showing that the origin of all of them lies in sensation and reflection. Although ideas are immediately "before the mind," not all of them are simple. Many of them are compounded, and their simple parts can be revealed on analysis. It is these simple ideas alone that are given in sensation and reflection. Out of them the mind forms complex ideas, though Locke is ambiguous on this point. For while he uses the language of "forming" or "compounding" and speaks of the "workmanship" of the mind, the compounding is frequently in accordance with what is perceived "to go together" and is not arbitrary.

Simple and complex ideas

Locke's reflections upon cause and effect, had they been elaborated, would undoubtedly have led him into acute difficulties. He does admit one failure. As an empiricist he can give no account of the idea of substance; it is, he thinks, essential and not to be denied, and yet it is not a simple idea given in sensation or reflection nor is it derived from simple ideas so given. In fact he can say little of it; it is "a-something-I-know-not-what." Thus, the case for empiricism cannot be said to be entirely established by Book II, but Locke thinks it strong enough for him to persist in the view that knowledge of the physical world is wholly derived from sense perception.

Self-knowledge. Some ideas are not of things outside the mind but are reflexive and internal. Locke finds it necessary to classify these in Book II and in doing so sets down the foundations of empirical psychology. His source of information is introspection and rarely the observation of behaviour. His account of sense perception is celebrated for its appreciation of the part that the interpretative mind plays in perceiving, and some of his farsighted observations on the relations between the senses, particularly vision and touch, have profoundly affected subsequent thought. He makes valuable remarks on memory, on discerning, on comparing, on madness, on pleasure and pain, on the emotions, and on the association of ideas.

Locke holds that man has an intuitive knowledge of his own existence and supposes that man exists as material and immaterial substance, but he is none too clear about this and at one point plays with the idea that man is simply material substance to which God has "superadded" a power of thinking. Locke's most valuable contribution, however, is his account of personal identity. Having distinguished between different types of identity, he argues that personal identity depends on self-consciousness (that is, I am the person who did so-and-so 20 years ago because I can remember myself doing it).

Language. According to Locke, Book III on language "cost [him] more pains" than any other book of his *Essay*; yet it is the book that has been most neglected. To understand thinking and knowing one must understand language as the means of thought and communication. Words are conventional signs; however, according to Locke, signs do not directly represent things but rather ideas of things. Thus, Locke carries a theory of ideas into his account of language. Frequently, the idea signified by the word is not clear, and sometimes words are used even when there are no ideas corresponding to them. This is particularly so in the case of general words, without which language would be so impoverished as to lose most of its worth. The use of general words, in Locke's mind, is bound up with the theory of universals. Does the general word stand for a particular idea that is used in a representative capacity? Or is the universal nothing more than a creation of the mind, through abstraction, to which is attached a name? In considering natural substances, Locke is inclined strongly toward a conceptualism according to which the use of general words is possible only because they signify "nominal essences." In this view what is meant is not the real essence but an abstract concept, something brought about through the "workmanship of the understanding." Locke also discusses the names of simple ideas and of relations, and it is interesting to find the crude beginnings of a discussion of what were later to be called logical or operative words. Book III contains also a valuable account of definition, which denies the theory that all definition must be *per genus et differentiam* (by comparison and contrast). The final chapters deal with the inevitable imperfections of language and with avoidable abuses.

General words

Conclusions. In Book IV, Locke discusses the nature and extent of human knowledge. The tone is more rationalistic than that of the previous books because the skepticism that emanated from his empiricism drove him to find the ideal of knowledge in the indubitable certainties of mathematics. There he was on common ground with the rationalists of his day, and indeed the direct influence of Descartes seems to be observable in the opening chapters of Book IV. Knowledge is perception, not sense perception but intellectual perception or intuition, frequently gained by a deliberate process of demonstration. But, even when this is so, each step in the demonstration is observed intuitionally, so that knowledge in the strict sense is essentially intuitive.

Knowledge and intuition

Unfortunately, what can be intuited and demonstrated is limited. Strict knowledge is not confined entirely to mathematics, but the intuition of relations within the physical world is impossible. Books II and III have shown that ideas and nominal essences can be grasped directly and that the inner nature of real things cannot be known, so that "science," in the exact sense of perfectly certain knowledge, is not possible in this sphere. The only possibility of intuiting is that within the world of ideas, an ideal world that is for Locke empirically derived and not intellectual in character. Knowledge in general terms he accordingly defines as the intuition or "perception of the connection of and agreement, or disagreement and repugnancy, of any of our ideas." Within the realm of ideas indubitable knowledge can be gained, but when dealing with ideas "whose archetypes are without them" the position is uncertain.

In spite of this, and somewhat inconsistently, Locke

thinks that knowledge approaches certainty in the "sensitive knowledge" of the existence of physical things. Further, knowledge of one's own existence is intuited. In these cases knowledge that is not an apprehension of a relation between ideas is nonetheless certain. But Locke makes it clear that, for the most part, knowledge of the physical world or of oneself is probable and rests not on intuition but on judgment; it is assenting to a proposition on the strength of the evidence, and there may be degrees of assent and wrong assent or error. Locke recognizes the need for a logic of probability, though he does little himself to meet that need. Yet it should be added that the important regular-sequence theory of induction, afterward developed by George Berkeley and David Hume, is put forward in the pages of Locke's *Essay*.

Political theory. Locke's most important work on political philosophy is that entitled *Two Treatises of Government*. The first treatise is a refutation of Sir Robert Filmer's *Patriarcha*, a defense of the divine right of kings that was written in the mid-17th century; the second and more important treatise refutes the absolutist theory of government as such.

Locke defines political power as "a right of making laws, with penalties of death, and consequently all less penalties for the regulating and preserving of property and of employing the force of the community in the execution of such laws, and in the defence of the commonwealth from foreign injury, and all this only for the public good." Government is thus a trust, forfeited by a ruler who fails to secure the public good. The ruler's authority, that is to say, is conditional rather than absolute. Nor does the individual surrender all his rights when he enters a civil society. He has established his right to property by "mixing his labour" with things originally given to mankind in common but now made his own by his labour. (Here in germ is the labour theory of value.) He has the right to expect political power to be used to preserve his property, in his own person and in his possessions, and the right to freedom of thought, speech, and worship. In fact the one right that he gives up in entering a civil society is the right to judge and punish his fellow man, which is his right in the state of nature. He quits his "executive power of the law of Nature" and "resigns it to the public"; he himself makes himself subject to the civil law and finds his freedom in voluntary obedience. To secure this freedom, Locke favoured a mixed constitution—the legislative should be an elected body, whereas the executive is usually a single person, the monarch—and he argues for a separation of legislative and executive powers. The people are ultimately sovereign, although it is not always clear in Locke's theory where the immediate sovereignty lies. But the people always have the right to withdraw their support and overthrow the government if it fails to fulfill their trust.

Freedom through law

Moral philosophy. One searches in vain for a consistent moral theory in Locke. His view that morality can be a science, as certain as mathematics, is well known. This might imply a rationalism, and there are indeed rationalist trends in his moral philosophy—although sometimes when advocating a science of morals he seems to have in mind simply the possibility of an exact analysis of the terms used in moral discourse and the clarification of moral statements. At other times, he puts forward a hedonist theory. "That we call *good* which is apt to cause or increase pleasure or diminish pain in us." But not every good is moral good: "*Moral* good and evil is only the conformity or disagreement of our voluntary actions to some law, whereby good or evil is drawn on us, from the will and power of the law-maker." In this view law rests on God's will, "the true ground of morality," though in saying this Locke does not appear to be consistent with what he says elsewhere of the law of nature.

Theory of education. A good education, as set forth by Locke in *Some Thoughts Concerning Education*, attends to both the physical and the mental. The body is not to be coddled; on the contrary, it is necessary that it should be hardened in various ways. The good educator insists on exercise, play, and plentiful sleep, "the great cordial of nature." Young children should be allowed to give vent to their feelings and should be restrained rarely. As for mental training, character comes first before learning; the educator's aim is to instill virtue, wisdom, and good breeding into the mind of the young. Parents, too, must interest themselves in their children's upbringing and, as far as possible, have them near; for no educative force is more powerful than the good example of parents. A stock of useful knowledge must be imparted: modern languages and Latin; geography and history; mathematics, as "the powers of abstraction develop"; and later civil law, philosophy, and natural science. For recreation, training in the arts, crafts, and useful hobbies should be available.

Religion. Locke's reaction against the "enthusiasm" of the sects in his youth had been sharp, and he disliked religious fanaticism throughout his life. He was a broad, tolerant Anglican anxious to heal the breach in English Protestant ranks. His own views on church government and on the priesthood were close to those of the dissenters, and he favoured the liberal views of the latitudinarians, of the Cambridge Platonists, and of the Remonstrants of Holland. This becomes manifest in *The Reasonableness of Christianity*. Two essentials, and two alone, he thinks, are involved in being a Christian: first, that a man should accept Christ as God's Messiah and, second, that he should live in accordance with Christ's teaching. His point of view is not far removed from that of the Deists on the one hand and the Unitarians on the other, yet he cannot be grouped with them. Christianity, though reasonable, needs revelation as well as reason, for human reason alone is inadequate: there is an experience of God "through His Spirit" without which all religion is empty. However, any act of persecution in the name of religious truth is wholly unjustified, since our knowledge and understanding are so confined. Each individual is a moral being, responsible before God, and this presupposes freedom. By the same token, no compulsion that is contrary to the will of the individual can secure more than an outward conformity.

Reason and revelation

Influence. Locke's faith in the salutary, ennobling powers of knowledge justifies his reputation as the first philosopher of the Enlightenment. In a broader context, he founded a tradition of thought that would span three centuries, in the schools of British empiricism and American pragmatism. In developing the Whig ideology underlying the Exclusion Controversy and the Revolution of 1688, Locke formulated the classic expression of liberalism, which was to inspire both the shapers of the American Revolution and the authors of the U.S. Constitution. Locke's influence remained strongly felt in the West in the 20th century, as notions of mind, freedom, and authority continued to be challenged and explored.

MAJOR WORKS

PHILOSOPHY, RELIGION, AND EDUCATION: *An Essay Concerning Humane* [sic] *Understanding* (1690); *Epistola de Tolerantia* (1689; *A Letter Concerning Toleration*, trans. by William Popple, 1689); *A Second Letter Concerning Toleration* (1690); *A Third Letter for Toleration* (1692); *Some Thoughts Concerning Education* (1693); *The Reasonableness of Christianity, as Delivered in the Scriptures* (1695); *A Vindication of the Reasonableness of Christianity* (1695); *A Second Vindication of the Reasonableness of Christianity* (1697); *Of the Conduct of the Understanding*, in *Posthumous Works of Mr. John Locke* (1706).

POLITICAL PHILOSOPHY AND ECONOMICS: *Two Treatises of Government* (1690); *Some Considerations of the Consequences of the Lowering of Interest, and Raising the Value of Money* (1692); *Short Observations on a Printed Paper, Intituled, for Encouraging the Coining Silver Money in England, and After for Keeping It Here* (1695); *Further Considerations Concerning Raising the Value of Money* (1695).

RECOMMENDED EDITIONS: A complete edition is *The Works of John Locke*, new ed. corrected, 10 vol. (1823, reprinted 1963). There is no complete modern edition of Locke's works, although several volumes have appeared in the Oxford Press series, "The Clarendon Edition of the Works of John Locke"; the first of these was a critical edition of *An Essay Concerning Human Understanding*, edited by Peter H. Nidditch (1975, reprinted 1979). Useful editions of other single works include *A Letter Concerning Toleration*, edited by James Tully (1983); *Two Treatises of Government*, edited by Peter Laslett, 2nd ed. (1967, reprinted 1970), a critical edition; and *The Educational Writings of John Locke: A Critical Edition with Introduction and Notes*, edited by James L. Axtell (1968).

BIBLIOGRAPHY

Biographies: Early works include LORD KING, *The Life and Letters of John Locke,* new ed. (1858, reissued 1984), an amateurish work but based on the Lovelace Collection of Locke papers in the possession of Peter King's family; and H.R. FOX BOURNE, *The Life of John Locke,* 2 vol. (1876, reprinted 1969), a detailed study, based on secondary sources. MAURICE W. CRANSTON, *John Locke: A Biography* (1957, reissued 1985), is now the standard biography. An outstanding resource is E.S. DE BEER (ed.), *The Correspondence of John Locke* (1976–), part of "The Clarendon Edition of the Works of John Locke"; 7 of 8 vol. have appeared to 1986.

Commentaries: JOHN W. YOLTON, *Locke: An Introduction* (1985); and JOHN DUNN, *Locke* (1984), provide general accounts of Locke's life and work. For Locke's theory of knowledge, see R.S. WOOLHOUSE, *Locke* (1983); and JAMES GIBSON, *Locke's Theory of Knowledge and Its Historical Relations* (1917, reprinted 1968), another useful introductory essay, if somewhat old-fashioned in its approach. For a survey of Locke's thought, see RICHARD I. AARON, *John Locke,* 3rd ed. (1971, reprinted 1973); D.J. O'CONNOR, *John Locke* (1952, reissued 1967); and JOHN W. YOLTON, *John Locke and the Way of Ideas* (1956, reprinted 1968), a study based on Locke's unpublished as well as his published writings.

Specialized commentaries on Locke's epistemology are found in JOHN W. YOLTON, *Locke and the Compass of Human Understanding: A Selective Commentary on the "Essay"* (1970); J.L. MACKIE, *Problems from Locke* (1976); and I.C. TIPTON (ed.), *Locke on Human Understanding: Selected Essays* (1977). Political theory is covered in STERLING POWER LAMPRECHT, *The Moral and Political Philosophy of John Locke* (1918, reprinted 1962); GERAINT PARRY, *John Locke* (1978); J.W. GOUGH, *John Locke's Political Philosophy: Eight Studies,* 2nd ed. (1973); and M. SELIGER, *The Liberal Politics of John Locke* (1968), an exposition and a defense of Locke's arguments for political freedom. W. VON LEYDEN, *Hobbes and Locke: The Politics of Freedom and Obligation* (1981); RICHARD H. COX, *Locke on War and Peace* (1960, reprinted 1982); and C.B. MACPHERSON, *The Political Theory of Possessive Individualism: Hobbes to Locke* (1962, reprinted 1983), explore the relationship between Locke's political thought and that of Thomas Hobbes. See also JOHN DUNN, *The Political Thought of John Locke: An Historical Account of the Argument of the "Two Treatises of Government"* (1969, reprinted 1982), a survey of Locke's thought in the context of his intellectual environment; and RAYMOND POLIN, *La Politique morale de John Locke* (1960, reprinted 1984), on Locke's liberalism from the perspective of a French historian of ideas. JAMES TULLY, *A Discourse on Property: John Locke and His Adversaries* (1980, reissued 1982); GORDON J. SCHOCHET, *Life, Liberty and Property: Essays on Locke's Political Ideas* (1971); and J.G.A. POCOCK and RICHARD ASHCRAFT, *John Locke* (1980), discuss Locke's defense of the natural right to property. See also KAREN IVERSEN VAUGHN, *John Locke: Economist and Social Scientist* (1980), for Locke's ideas on economics; and KENNETH DEWHURST, *John Locke, 1631–1704, Physician and Philosopher* (1963, reprinted 1984), on his career as a practitioner and theorist of medical science. Research in progress, queries, and corrections to published work on Locke are reported in *The Locke Newsletter* (annual).

Bibliographies: H.O. CHRISTOPHERSEN, *A Bibliographical Introduction to the Study of John Locke* (1930, reprinted 1968), is still useful, although its references have been assimilated into a larger, more recent work, JEAN S. YOLTON and JOHN W. YOLTON, *John Locke: A Reference Guide* (1985)—both cover mainly secondary sources. JOHN C. ATTIG (comp.), *The Works of John Locke: A Comprehensive Bibliography from the Seventeenth Century to the Present* (1985), tracks the various editions and translations of Locke's writings and places them in historical context. See also ROLAND HALL and R.S. WOOLHOUSE, *80 Years of Locke Scholarship: A Bibliographical Guide* (1983); and P. LONG, *A Summary Catalogue of the Lovelace Collection of the Papers of John Locke in the Bodleian Library* (1959), a guide to the most important source of manuscript material.

(R.Aa./Ed.)

The History and Kinds of Logic

The major task of logic has been to establish a systematic way of deducing the logical consequences of a set of sentences. In order to accomplish this, it is necessary first to identify or characterize the logical consequences of a set of sentences. Then the procedures for deriving conclusions from a set of sentences need to be examined to verify that all logical consequences, and only those, are deducible from that set. Finally, in recent times, the question has been raised whether all the truths regarding some domain of interest can be contained in some specifiable deductive system.

In this article the several formal systems of modern logic are examined, as is the general study of these systems themselves. Consideration is given to the application of logical investigations to its original area of concern, argumentative discourse, as well as to new areas such as epistemology and deontology (the logic of duties). The historical development of logic from ancient Greece through the medieval period to modern times is delineated.

This article is divided into the following sections:

Arguments

General considerations. From its very beginning, the field of logic has been occupied with arguments, in which certain statements, the premises, are asserted in order to support some other statement, the conclusion. If the premises are intended to provide conclusive support for the conclusion, the argument is a deductive one. If the premises are intended to support the conclusion only to a lesser degree, the argument is called inductive. A logically correct deductive argument is termed valid, while an acceptable inductive argument is called cogent. The notion of support is further elucidated by the observation that the truth of the premises of a valid deductive argument necessitates the truth of the conclusion: it is impossible for the premises to be true and the conclusion false. The truth of the premises of a cogent inductive argument, on the other hand, confers only a probability of truth on its conclusion: it is possible for the premises to be true while the conclusion is false.

Logic is not concerned to discover premises that persuade an audience to accept, or to believe, the conclusion. This is the subject of rhetoric. The notion of rational persuasion is sometimes used by logicians in the sense that, if one were to accept the premises of a valid deductive argument, it would not be rational to reject the conclusion; one would in effect be contradicting oneself in practice. The case of inductive logic will be considered below.

From the above characterization of arguments, it is evident that they are always advanced in some language, either a natural language such as English or Chinese or, possibly, a specialized technical language such as mathematics. To develop rules for determining the validity of deductive arguments, the statements comprising the argument must be analyzed in order to see how they relate to one another. The analysis of the logical forms of arguments can be accomplished most perspicuously if the statements of the argument are framed in some canonical form. Additionally, when stated in a regimented format, various ambiguities or other defects of the original statements can be avoided.

When they are stated in a natural language, some arguments appear to give support to their conclusions or to confute a thesis. Such a defective, although apparently

Fallacies

correct, argument is called a fallacy. Some of these errors in argument occur often enough that types of such fallacies are given special names. For example, if one were to attack the premises of an argument by casting aspersions on the character of the proponent of the argument, this would be characterized as committing an ad hominem fallacy. The character of the proponent of an argument has no relevance to the validity of the argument. There are several other fallacies of relevance, such as threatening the audience (*argumentum ad baculum*) or appealing to their feelings of pity (*argumentum ad misericordiam*).

The other major grouping of fallacies concerns those apparently correct arguments whose plausibility depends on some ambiguity. For an argument to be valid it is required that the terms occurring in the argument retain one meaning throughout. Subtle shifts of meaning that destroy the correctness of any argument can occur in natural language expressions:

> Today chain-smokers are rapidly disappearing.
> Karen is a chain-smoker.
> Therefore, today Karen is rapidly disappearing.

Clearly what is intended in the first premise is that the class of chain-smokers is becoming a smaller class, not that the individuals in the class are undergoing any change. A well-known, classic example of incorrect reasoning based on an ambiguity arising from the grammatical construction employed, the so-called amphiboly, is the case of Croesus, king of Lydia in the 6th century BC, who was considering invading Persia. When he consulted the oracle at Delphi, he is reported to have received the following reply: "If Croesus goes to war with Cyrus (the king of Persia), he will destroy a mighty kingdom." Croesus inferred that his campaign would be successful, but in fact he lost, and consequently his own mighty kingdom was destroyed.

One of the first and best-known—and most successful—attempts to provide a regimented framework within which some important deductive arguments could be recognized as valid or invalid was that of Aristotle. Many arguments are composed of premises and conclusions that are stated or could be restated as categorical propositions. Categorical propositions may be distinguished first by their quality, either affirmative or negative. An affirmative categorical proposition asserts that all or some of a class of objects are included in another class of objects (*e.g.*, "All whales are mammals"), while a negative categorical proposition asserts that all or some of a class of objects are not included in another class of objects (*e.g.*, "Some pets are not dogs").

Categorical propositions

Secondly, categorical propositions may be distinguished by their quantity, either universal or particular. When the assertion is that all of a class of objects are or are not included in another class of objects, the proposition is universal. When only some (precisely, at least one) of a class are or are not included in another, the proposition is particular.

The two distinguishing features above lead to four types of categorical proposition:

A:	universal affirmative	All *A*'s are *B*'s.
E:	universal negative	No *A*'s are *B*'s.
I:	particular affirmative	Some *A*'s are *B*'s.
O:	particular negative	Some *A*'s are not *B*'s.

The letters to the left, A, E, I, and O, are the standard labels for these types of propositions. The expressions in the right column are schematic sentences, requiring, in this case, English phrases referring to classes of objects where *A* and *B* are located. Some examples of categorical propositions in this standard form are:

> A: All games are enjoyable activities.
> E: No wars are enjoyable activities.
> I: Some women are soldiers.
> O: Some women are not soldiers.

Not all arguments in ordinary contexts are expressed in categorical propositions. Indeed, most are not. The sample A proposition above would more likely be expressed as: "All games are enjoyable." But *enjoyable* is an adjective and does not refer to a class of objects. The adjective must be replaced by a noun phrase to obtain a proper categorical proposition. In all cases, propositions must be expressed using two noun phrases joined by the appropriate copula, a form of the verb *to be*.

> Original: Some sailors are dancing.
> Rewritten: Some sailors are persons who are dancing.

(Note that "Some sailors are dancers" is not quite right, since a dancer may not actually be dancing at the moment.)

Most languages contain many more verbs than the standard copula; hence, there are many grammatical statements that do not use variations of this verb. These sentences must be rewritten as well:

> Original: All dogs bark.
> Rewritten: All dogs are animals that bark.

Even variations of the verb *to be* must be rewritten:

> Original: Some lucky person will win the lottery.
> Rewritten: Some lucky persons are persons who will win the lottery.

Another difficulty with the requirement that all arguments be expressed using categorical propositions is that some arguments involve reference to one individual. The sentence "Socrates is a Greek" is considered to be a singular proposition. Some logicians allow such sentences in arguments and treat them as universal categorical propositions. It is usually better, however, to rewrite such sentences as explicit categorical propositions:

> All persons identical to Socrates are Greeks.

The class referred to by the subject term "persons identical to Socrates" has one and only one object in it—namely, Socrates himself.

A natural language usually has various rhetorical devices for expressing quantifiers, and some languages—English, for example—occasionally do not even express the quantifier, letting the grammatical construction convey that

information instead. We find "A cow is a mammal" referring to cows in general, so it would be regimented as "All cows are mammals." Examples of noncategorical quantifiers along with appropriate translations into categorical propositions are:

Original: A few scientists are dullards.
Rewritten: Some scientists are dullards.

Original: Not everyone who runs for office is elected.
Rewritten: Some persons who run for office are not elected persons.

Original: All entrants can't be winners.
Rewritten: Some entrants are not winners.

Original: Automobiles are not toys.
Rewritten: No automobiles are toys.

Conditional sentences

Conditional sentences have the form "If . . . , then ___." If the antecedent ("if" clause) and the consequent ("then" clause) refer to the same class of objects, the conditional can be rewritten in categorical form. Otherwise, it cannot be rewritten and must be dealt with differently (see below *Other argument forms*). Some conditionals whose antecedent and consequent refer to the same class of objects are:

1. If an animal is a tiger, (then) it's a carnivore.
2. If it's a snake, then it's not a mammal.
3. A student will succeed if he or she studies assiduously. (Note the reversal of the clauses.)

These are rewritten in categorical form as:

1. All tigers are carnivores.
2. No snakes are mammals.
3. All students who study assiduously are students who will succeed.

When the antecedent and consequent refer to different classes, such rewriting is not possible (*e.g.*, "If the president is reelected, then I shall never vote again").

Finally there are such locutions as "Only" (or "None but"), "The only," and "All except" (or "All but"). When it is asserted that only *A*'s are *B*'s, it is not claimed that *A*'s are *B*'s. Rather, it is claimed that, if anything is a *B*, then it is also an *A*. So, for example, if it is asserted that only entrants are prizewinners, no one is asserting that all entrants will win a prize. What is asserted is that all prizewinners are entrants. The case "The only" is quite different. Here, "The only winners are Texans" is expressed by the proposition "All winners are Texans." The phrase "All except" introduces an exceptive proposition. It requires two categorical propositions to state everything asserted by an exceptive proposition. The statement "All except crew members abandoned ship" asserts that everyone who was not a crew member abandoned ship and that no crew member abandoned ship. Thus, two categorical propositions are needed to express this exceptive proposition:

All non-crew members are persons who abandoned ship.
No crew members are persons who abandoned ship.

Immediate inference. The simplest possible arguments that can be constructed from categorical propositions are those with one premise and, of course, one conclusion. These are called immediate inferences. In order to characterize the valid arguments with one premise, it is necessary to consider various transformations of a categorical proposition. One transformation switches the subject and predicate terms of a proposition, resulting in a proposition called the converse of the original.

Transformations

	Original	Converse
A:	All *A*'s are *B*'s.	All *B*'s are *A*'s.
E:	No *A*'s are *B*'s.	No *B*'s are *A*'s.
I:	Some *A*'s are *B*'s.	Some *B*'s are *A*'s.
O:	Some *A*'s are not *B*'s.	Some *B*'s are not *A*'s.

Only in the cases of E and I propositions can one immediately infer the converse. That is, only these inferences by conversion are correct:

No snakes are birds.
∴ No birds are snakes.

Some cats are pets.
∴ Some pets are cats.

The obverse of a proposition is a more complicated transformation. The quality of the proposition is changed from affirmative to negative (or from negative to affirmative), and the predicate term is replaced by its negation (frequently formed by prefixing "non-"). Thus, "All *A*'s are *B*'s" becomes "No *A*'s are non-*B*'s," and similarly for the other three categorical propositions. The obverse of any categorical proposition is logically equivalent to the original and hence may be immediately inferred from it:

No snakes are birds.
∴ All snakes are non-birds.

Some cats are pets.
∴ Some cats are not non-pets.

All whales are mammals.
∴ No whales are non-mammals.

Some dogs are not friendly animals.
∴ Some dogs are non-friendly animals.

The contrapositive of a categorical proposition is formed by converting the proposition (switching subject and predicate terms) and then negating both the subject and predicate. Only in the cases of A and O propositions can the contrapositive be inferred as a valid conclusion:

All whales are mammals.
∴ All non-mammals are non-whales.

Some pets are not cats.
∴ Some non-cats are not non-pets.

In the cases of E and I propositions, the contrapositive does not follow as a valid conclusion.

These immediate inferences are frequently employed to transform propositions in an argument into a form that enables the more complex argument to be analyzed.

Categorical syllogisms. The next more complex form of argument is one with two categorical propositions as premises and one categorical proposition as conclusion. When arguments of this type have exactly three terms occurring throughout the argument and when the predicate term of the conclusion occurs in the first premise and the subject term of the conclusion occurs in the second premise, the argument is called a categorical syllogism.

Mood and figure

The pattern of the types of categorical propositions as they occur in a syllogism, frequently indicated by the appropriate letters (A, E, I, O), is called the mood of the syllogism. Thus, possible moods are AAA, AIO, EIO, and so on. Within a given mood, the terms can occur in various patterns. The pattern in which the terms S, M, and P (subject, middle, and predicate) are arranged is called the figure of the syllogism. For instance, in the first premise the predicate term of the conclusion may appear first as the subject of the premise or it may occur last as the predicate of the premise. This is also true for the subject term of the conclusion when it occurs in the second premise. There are four possibilities:

Figure 1	Figure 2	Figure 3	Figure 4
M—P	P—M	M—P	P—M
S—M	S—M	M—S	M—S
∴ S—P	∴ S—P	∴ S—P	∴ S—P

Thus a syllogism in the fourth figure, with mood AAA, is called AAA-4:

All *P*'s are *M*'s.
All *M*'s are *S*'s.
∴ All *S*'s are *P*'s.

All cantaloupes are fruits.
All fruits are seed-bearers.
∴ All seed-bearers are cantaloupes.

Intuitively, it is obvious that this is not a valid argument. The task of logic is to show why a syllogism is valid or not. An example of a valid syllogism is EIO in the second figure:

No *P*'s are *M*'s.
Some *S*'s are *M*'s.
∴ Some *S*'s are not *P*'s.

No scientists are children.
Some infants are children.
∴ Some infants are not scientists.

The validity of a syllogism depends on the relations among the classes referred to by the terms of the argument. If all of one class is contained in a second class and none of the second class is in a third, then none of the first class is in the third either. Using this principle and others like it, logicians have been able to establish which syllogisms are valid and which are not.

Arguments presented in ordinary contexts, even when statable in categorical propositions, may not be simple syllogisms. Often essential premises are not stated, because they are so obvious and trivial as not to require mentioning. When an essential premise is not stated, the argument is called an enthymeme. Enthymematic arguments need to have their hidden premises made explicit before a test for validity can be made. In addition, arguments often contain more than two premises. Indeed, some arguments can be structured as a sequence of syllogisms, where preliminary conclusions are expressly drawn and then are used as premises in later syllogisms. Such a chain of subarguments is called a sorites. The English logician and novelist Lewis Carroll devised clever, whimsical sorites that have entertained students for more than 100 years. For instance, in *Symbolic Logic* (1896) he presented the following argument, whose conclusion was left unexpressed:

All my sons are slim.
No child of mine is healthy who takes no exercise.
All gluttons who are children of mine are fat.
No daughter of mine takes any exercise.

In addition, certain crucial premises of this argument—such as "No slim persons are fat persons"—have not been expressed.

Other argument forms. The argument form most discussed and studied from the time of Aristotle to the early 19th century was the syllogism. But Aristotle himself noted that some arguments were expressed in propositions other than categorical ones. The following argument, for instance, has for its first premise a hypothetical proposition:

Hypothetical arguments

If all men are born equals, then all slaves are unjustly treated persons.
All men are born equals.
∴ All slaves are unjustly treated persons.

This is a hypothetical argument, often called a hypothetical syllogism. Hypothetical propositions have the form "If . . . , then ___," where the word "then" is often omitted. When, as above, the conclusion is obtained by the second premise's affirming the antecedent, the argument is said to be by modus ponens. The conclusion in this case is the consequent of the hypothetical first premise.

A hypothetical argument can also be conducted by denying the consequent of the hypothetical premise and thereby concluding with a denial of the antecedent of the hypothetical. This form of hypothetical argument is called modus tollens, and the denials in either case are frequently expressed by the contradictory of the proposition at issue, either the antecedent or consequent of the hypothetical. An example of a modus tollens hypothetical argument is

If some persons are persons with rights to freedom, then all persons are persons with rights to freedom.
Not all persons are persons with rights to freedom.
∴ No persons are persons with rights to freedom.

Disjunctions are propositions in which the predicate is asserted to belong to one or another subject, or one or another predicate is asserted to belong to a subject: "Either *A*'s or *B*'s are *C*'s, or *A*'s are either *B*'s or *C*'s." Another more complex disjunction takes two categorical propositions as alternatives: "Either *A*'s are *B*'s, or *C*'s are *D*'s." A disjunctive argument (sometimes called a disjunctive syllogism) contains one of the three above disjunctive forms as one premise and the denial of one of the alternatives (disjuncts) as the second premise. The valid conclusion in these cases is the other alternative. A simple and traditional example is

Either God is unjust, or no men are eternally punished creatures.
God is not unjust.
∴ No men are eternally punished creatures.

The singular proposition here ("God is unjust") is treated as a universal categorical proposition.

Sometimes the alternatives are meant to be exclusive—that is, if one is true, the other is false. When such is the case, a valid disjunctive argument can then be constructed by affirming one of the alternatives in a premise and subsequently concluding a denial of the other alternative. Thus,

Either Bacon or Shakespeare is the author of Hamlet.
Shakespeare is the author of *Hamlet*.
∴ Bacon is not the author of *Hamlet*.

Unfortunately, it is not always evident whether the disjunction is to be taken in the inclusive or the exclusive sense, and the careful logician will usually explicitly assert "*A* or *B*, but not both." Examples of ambiguity of disjunction abound: "Newton or Leibniz is the discoverer of the calculus (possible codiscoverers)"; "All diplomats are liars or failures."

A combination of a disjunction and hypothetical propositions as premises gives rise to a type of argument known as a dilemma. The hypothetical propositions offer alternatives, either one of which leads to a (frequently unpalatable) conclusion. When the conclusions of both alternatives are the same, it is a simple dilemma; when they differ, it is a complex dilemma. If the antecedent of the hypothetical proposition is affirmed, and thus the consequent is also affirmed as conclusion, the argument is constructive. When the consequent is denied, and thus the antecedent is denied as conclusion, the argument is called destructive. Some illustrations of these types of dilemmas are displayed below. (For ease of reading, these propositions are not written in categorical form but are expressed as they would be colloquially.)

Dilemmas

Simple constructive:

If a science furnishes useful facts, it is worthy of being cultivated; and if the study of it exercises the reasoning powers, it is worthy of being cultivated. But either a science furnishes useful facts, or its study exercises the reasoning powers. Therefore it is worthy of being cultivated.

(William Stanley Jevons, *Elementary Lessons in Logic* [1870].)

Complex constructive:

If there is censorship of the press, abuses of power will be concealed; and if there is no censorship, truth will be sacrificed to sensation. But there must either be censorship or not. Therefore either abuses of power will be concealed, or truth will be sacrificed to sensation.

(Horace William Brindley Joseph, *An Introduction to Logic* [1916].)

Destructive:

If this person were wise, he would not speak irreverently of Scripture in jest; and if he were good, he would not do so in earnest. But he does it either in jest or earnest. Therefore he is either not wise or not good.

(Richard Whately, *Elements of Logic* [1826].)

Symbolic logic. A number of developments during the Renaissance and immediately thereafter—the period of the emergence of modern science—led to increasing dissatisfaction with the traditional logic of the syllogism. In particular, the development of functional relations in natural science, the shift of interest from geometry to algebra in mathematics, the concern for the logical foundations of mathematics, and the call for a language that would reveal logical relations by its very notation (compare Gottfried Wilhelm Leibniz' *characteristica universalis*) led to the developments in the 19th century that can be called the algebra of logic. It is notorious that the British mathematician and logician Augustus De Morgan (1847) found fault with the syllogism by pointing out that it cannot (easily) deal with the simple relational inference:

All horses are animals.
∴ All heads of horses are heads of animals.

Although various abbreviations were accomplished through symbols, even in the works of Aristotle himself, the use of symbols in an explicit formal system, the precursor of modern symbolic logic, began with George Boole (1847) and Ernst Schröder (1890–1905), was developed further by Gottlob Frege (1879), and finally culminated in the *Principia Mathematica* of Bertrand Russell and Alfred North Whitehead (1910–13). The formal systems of modern symbolic logic differ from earlier logical studies

Modern systems of symbolic logic

that used symbols in that, in the former, totally artificial languages are rigorously developed using special symbols for precisely defined logical concepts. The rules of this language, both the syntactic rules for deduction and the semantic rules for interpreting expressions, are explicitly and precisely stated. The development of these symbolic formal systems within which deductive arguments can be represented yields a number of distinct advantages. A high degree of rigour can be attained. The sharp separation of semantics from syntax leads to a clear distinction between the validity of an argument (semantics) and the deducibility of the conclusion from axioms and premises (syntax). Additionally, the formal system, once made totally explicit, can itself be the object of study (see below *Logic systems: Metalogic*).

The logical relations among whole sentences is the basis of the modern symbolic approach. In effect, hypothetical and disjunctive arguments rather than the categorical syllogism become the centre of attention. Beginning with simple sentences that have no simpler sentences as components, one constructs compound sentences using sentential connectives. The truth value (either true or false) of the compound sentence depends then on the truth values of its components in a clear and explicit manner according to which function is represented by the sentential connective. For instance, the propositional truth function called conjunction, which is frequently represented by "$\cdot$" or "&," has the value true when both the conjoined propositions have the value true; otherwise it has the value false. In other words, if p and q are arbitrary propositions, the sentence "$p \cdot q$" represents a true proposition just in case both p and q are true propositions themselves. The formalization of these truth functions and the statement of the rules for inferring new sentences from earlier ones (the rules of inference) results in a formal system called the propositional calculus (PC).

Yet PC cannot deal with arguments formerly handled by the categorical syllogism. Some way of dealing with the internal structure of simple sentences needs to be developed. The great power of modern logic is based on the important notion of a propositional function. A propositional function acts on a domain of individuals and has the value true or false, depending on which individual (or individuals) is the argument of the function. Thus, "___ is an even number" represents a propositional function whose value is true whenever the blank is filled by a numeral referring to an even number and false when the number is odd.

Individual variables

Instead of using expressions with blank spaces, which can be confusing if there is more than one blank, logicians utilize what are termed individual variables, expressions that hold open a place in a sentence fragment for the name of some individual. Individual variables are frequently lowercase letters from the end of the alphabet. So the example in the previous paragraph would be written: "x is an even number." This expression can become a sentence when the variable "x" is replaced by the name of some thing—a true sentence when that thing is an even number. There are other ways to convert such expressions into sentences. One can prefix the expression with a universal quantifier, "For all x." Now the resulting sentence, "For all x, x is an even number," expresses the false proposition that everything is an even number. Furthermore, prefixing the expression with an existential quantifier, "There is at least one x," yields the true sentence, "There is at least one thing such that it is an even number."

Being an even number is a property that some individuals can have. Expressions that attribute a property to an individual are (monadic) predicates. It is customary to express simple predicates by uppercase letters placed before the individual term. Thus if E is used for the predicate "is an even number," the expression Ex is intended to represent "x is an even number." Using monadic predicates, quantifiers, individual variables, and the sentential connectives developed in PC, it is possible to express all the categorical syllogisms and subsequently determine their validity. When rules of inference and possibly axioms are introduced, this system is called the monadic predicate calculus. When relations are asserted to hold between two or more individuals, additional, n-adic, predicates enter the language. For example, using the uppercase letter L to express the dyadic relation of being less than, and taking a and b to be any (not necessarily different) numbers, one can assert that a is less than b by writing: Lab. The notation of dyadic relation symbols allows a simple expression, and solution, of De Morgan's problem, mentioned above, about heads of horses. One may even introduce the notion of predicate variables; but, as long as there is no quantification over predicate variables, the resulting formal system is called the lower predicate calculus (LPC).

One further extension of LPC is usually made in modern logic. One special dyadic relation, represented by the equality sign, "=," placed between two terms, is taken to be the identity relation. Depending on the type of formal system that is being considered, either axioms of identity (*e.g.*, "Everything is self-identical") are adopted or else rules of inference governing transformations (*e.g.*, "From any conclusion φ containing the name a and an earlier line of derivation, $a = b$, infer a new conclusion φ' containing b for some occurrences of a") are added to the earlier rules of the system. The resulting system, which in effect restricts the possible interpretations of LPC to the identity relation for the dyadic predicate "=," is called LPC with identity (or sometimes first-order logic with identity). Several considerations suggest that this is the most comprehensive logical system possible and that any other additions will no longer result in all logical truths, and only logical truths, as theorems.

In formal systems the emphasis shifts from arguments to deducing conclusions. The rules of inference of the system allow various transformations on, or inferences from, initial sequences of symbols. When no additional material assumptions are used, the final line of any such derivation is called a theorem of logic. When, however, assumptions about some field of inquiry are incorporated into the formal system, the theorems derived by using the rules of the system are theorems of the material theory. Thus, if certain postulates about the behaviour of moving bodies are laid down, one would derive theorems of kinematics—and similarly for arithmetic, geometry, and so on.

Four major areas of investigation

Modern logic in the last part of the 20th century can be divided into four major areas of investigation. The first area is proof theory, the study of the properties of formal systems and the derivations that can be accomplished within them. The second area is model theory, which investigates the various structures about which formal theories can be constructed. Here the emphasis is on what cannot be validly deduced from a set of material hypotheses. One attempts to find structures about which the hypotheses are true and yet for which a particular statement is false. Third is recursion theory, which deals with questions involving the decidability of the question of whether or not a sentence is deducible from a set of premises. This study has led to theories of computability, or the existence of mechanical procedures for solving problems associated with deducibility. Finally, there is the broad area of the foundations of mathematics, especially the logical grounding of the basic notions of set theory.

Applications of the formal methods of logic have burgeoned with the development of novel semantic devices such as "possible worlds." It is now possible to provide a semantics for various modal logics dealing with such topics as necessarily true propositions, known propositions (as distinct from those merely believed), obligatory actions, and the structure of temporal relations. Previously, formulas of modal logic were merely uninterpreted sequences of symbols with no clear meanings. In addition, grammatical studies within the general field of linguistics has benefited from the seminal work of the American logician Richard Montague (1970) and subsequent developments.

Inductive logic. Inductive arguments intend to support their conclusions only to some degree; the premises do not necessitate the conclusion. Traditionally, the study of inductive logic was confined to either arguments by analogy or else methods of arriving at generalizations on the basis of a finite number of observations. A typical argument by analogy proceeds from the premise that two objects are observed to be similar with respect to a number of

attributes to the conclusion that the two objects are also similar with respect to another attribute. The strength of such arguments depends on the degree to which the attributes in question are related to each other.

The methods appropriate to inductive generalizations have been studied by modern philosophers from Francis Bacon in the early 17th century to William Whewell and John Stuart Mill in the 19th century. Proper inductive generalizations require that the observed instances referred to in the premises be obtained according to a careful method of varying the circumstances of observations, a rigorous search for exceptional cases, and attempts to detect correlations or dependencies among the various phenomena.

In the 20th century, most notably in the work of Hans Reichenbach (1938), a distinction has been made between the context of discovery and the context of justification, between the nonlogical process for arriving at a general hypothesis and the logical relations that obtain between the hypothesis and the evidence for it—the so-called hypothetico-deductive method. In modern inductive logic, the probability calculus, or some variant of it, is called upon to explicate the notion of how observed evidence logically supports a theoretical hypothesis. (M.L.Sc.)

LOGIC SYSTEMS

Formal logic

The discipline known as formal logic takes as its main subject matter propositions (or statements, or assertively used sentences) and deductive arguments, and it abstracts from their content the structures or logical forms that they embody. The logician customarily uses a symbolic notation to express these structures clearly and unambiguously and to enable manipulations and tests of validity to be more easily applied. Although this discussion freely employs the technical notation of modern symbolic logic, its symbols are introduced gradually and with accompanying explanations so that the serious and attentive general reader should be able to follow the development of ideas.

A priori nature of formal logic

Formal logic is an a priori, and not an empirical, study. In this respect it contrasts with the natural sciences and with all other disciplines that depend on observation for their data. Its nearest analogy is with pure mathematics; indeed, many logicians and pure mathematicians would regard their respective subjects as indistinguishable, or as merely two stages of the same unified discipline. Formal logic, therefore, is not to be confused with the empirical study of the processes of reasoning, which belongs to psychology. It must also be distinguished from the art of correct reasoning, which is the practical skill of applying logical principles to particular cases; and, even more sharply, it must be distinguished from the art of persuasion, in which invalid arguments are sometimes more effective than valid ones.

GENERAL OBSERVATIONS

Probably the most natural approach to formal logic is through the idea of the validity of an argument of the kind known as deductive. A deductive argument can be roughly characterized as one in which the claim is made that some proposition (the conclusion) follows with strict necessity from some other proposition or propositions (the premises)—*i.e.*, that it would be inconsistent or self-contradictory to assert the premises but deny the conclusion.

If a deductive argument is to succeed in establishing the truth of its conclusion, two quite distinct conditions must be met: first, the conclusion must really follow from the premises—*i.e.*, the deduction of the conclusion from the premises must be logically correct—and, second, the premises themselves must be true. An argument meeting both these conditions is called sound. Of these two conditions, the logician as such is concerned only with the first; the second, the determination of the truth or falsity of the premises, is the task of some special discipline or of common observation appropriate to the subject matter of the argument. When the conclusion of an argument is correctly deducible from its premises, the inference from the premises to the conclusion is said to be (deductively) valid, irrespective of whether the premises are true or false. Other ways of expressing the fact that an inference is deductively valid are to say that the truth of the premises gives (or would give) an absolute guarantee of the truth of the conclusion or that it would involve a logical inconsistency (as distinct from a mere mistake of fact) to suppose that the premises were true but the conclusion false.

Inference forms

The deductive inferences with which formal logic is concerned are, as the name suggests, those for which validity depends not on any features of their subject matter but on their form or structure. Thus the two inferences

Every dog is a mammal. (1)
Some quadrupeds are dogs.
∴ Some quadrupeds are mammals.

and

Every anarchist is a believer in free love. (2)
Some members of the government party are anarchists.
∴ Some members of the government party are believers in free love.

differ in subject matter and hence require different procedures to check the truth or falsity of their premises. But their validity is ensured by what they have in common—namely, that the argument in each is of the form:

Every X is a Y. (3)
Some Z's are X's.
∴ Some Z's are Y's.

Line (3) above may be called an inference form, and (1) and (2) are then instances of that inference form. The letters—X, Y, and Z—in (3) mark the places into which expressions of a certain type may be inserted. Symbols used for this purpose are known as variables; their use is analogous to that of the x in algebra, which marks the place into which a numeral can be inserted. An instance of an inference form is produced by replacing all the variables in it by appropriate expressions—*i.e.*, ones that make sense in the context—and by doing so uniformly—*i.e.*, by substituting the same expression wherever the same variable recurs. The feature of (3) that guarantees that every instance of it will be valid is its construction in such a manner that every uniform way of replacing its variables to make the premises true automatically makes the conclusion true also, or, in other words, that no instance of it can have true premises but a false conclusion. In virtue of this feature, the form (3) is termed a valid inference form. In contrast,

Every X is a Y. (4)
Some Z's are Y's.
∴ Some Z's are X's.

is not a valid inference form, for, although instances of it can be produced in which premises and conclusion are all true, instances of it can also be produced in which the premises are true but the conclusion is false—*e.g.*,

Every dog is a mammal. (5)
Some winged creatures are mammals.
∴ Some winged creatures are dogs.

Formal logic as a study is concerned with inference forms rather than with particular instances of them; one of its tasks is to discriminate between valid and invalid inference forms and to explore and systematize the relations that hold among valid ones.

Valid proposition forms

Closely related to the idea of a valid inference form is that of a valid proposition form. A proposition form is an expression of which the instances (produced as before by appropriate and uniform replacements for variables) are not inferences from several propositions to a conclusion but rather propositions taken individually, and a valid

proposition form is one for which all of the instances are true propositions. A simple example is

Nothing is both an X and a non-X. (6)

Formal logic is concerned with proposition forms as well as with inference forms. The study of proposition forms can, in fact, be made to include that of inference forms in the following way: let the premises of any given inference form (taken together) be abbreviated by alpha (α) and its conclusion by beta (β). Then the condition stated above for the validity of the inference form "α, therefore β" amounts to saying that no instance of the proposition form "α and not-β" is true—*i.e.,* that every instance of the proposition form

Not both: α and not-β (7)

is true—or that line (7), fully spelled out, of course—is a valid proposition form. The study of proposition forms, however, cannot be similarly accommodated under the study of inference forms, and so for reasons of comprehensiveness it is usual to regard formal logic as the study of proposition forms. Because a logician's handling of proposition forms is in many ways analogous to a mathematician's handling of numerical formulas, the systems he constructs are often called calculi.

Much of the work of a logician proceeds at a more abstract level than that of the foregoing discussion. Even a formula such as (3) above, though not referring to any specific subject matter, contains expressions like "every" and "is a," which are thought of as having a definite meaning, and the variables are intended to mark the places for expressions of one particular kind (roughly, common nouns or class names). It is possible, however—and for some purposes it is essential—to study formulas without attaching even this degree of meaningfulness to them. The construction of a system of logic, in fact, involves two distinguishable processes: one consists in setting up a symbolic apparatus—a set of symbols, rules for stringing these together into formulas, and rules for manipulating these formulas; the second consists in attaching certain meanings to these symbols and formulas. If only the former is done, the system is said to be uninterpreted, or purely formal; if the latter is done as well, the system is said to be interpreted. This distinction is important, because systems of logic turn out to have certain properties quite independently of any interpretations that may be placed upon them. An axiomatic system of logic can be taken as an example—*i.e.,* a system in which certain unproved formulas, known as axioms, are taken as starting points, and further formulas (theorems) are proved on the strength of these. As will appear later (*Axiomatization of PC*), the question whether a sequence of formulas in an axiomatic system is a proof or not depends solely on which formulas are taken as axioms and on what the rules are for deriving theorems from axioms, and not at all on what the theorems or axioms mean. Moreover, a given uninterpreted system is in general capable of being interpreted equally well in a number of different ways; hence, in studying an uninterpreted system, one is studying the structure that is common to a variety of interpreted systems. Normally a logician who constructs a purely formal system does have a particular interpretation in mind, and his motive for constructing it is the belief that when this interpretation is given to it the formulas of the system will be able to express true principles in some field of thought; but, for the above reasons among others, he will usually take care to describe the formulas and state the rules of the system without reference to interpretation and to indicate as a separate matter the interpretation that he has in mind.

Interpreted and uninterpreted systems

Many of the ideas used in the exposition of formal logic, including some that are mentioned above, raise problems that belong to philosophy rather than to logic itself. Examples are: What is the correct analysis of the notion of truth? What is a proposition, and how is it related to the sentence by which it is expressed? Are there some kinds of sound reasoning that are neither deductive nor inductive? Fortunately, it is possible to learn to do formal logic without having satisfactory answers to such questions, just as it is possible to do mathematics without answering questions belonging to the philosophy of mathematics such as: Are numbers real objects or mental constructs?

THE PROPOSITIONAL CALCULUS

Basic features of PC. The simplest and most basic branch of logic is the propositional calculus, hereafter called PC, named from the fact that it deals only with complete, unanalyzed propositions and certain combinations into which they enter. Various notations for PC are used in the literature. In that used here the symbols employed in PC first comprise variables (for which the letters p, q, r, . . . are used, with or without numerical subscripts); second, operators (for which the symbols "$\sim$," "$\cdot$," "$\vee$," "$\supset$," "$\equiv$" are employed); and third, brackets or parentheses. The rules for constructing formulas are discussed below (see *Formation rules for PC*), but the intended interpretations of these symbols—*i.e.,* the meanings to be given to them—are indicated here immediately: The variables are to be viewed as representing unspecified propositions or as marking the places in formulas into which sentences, and only sentences, may be inserted. (This is sometimes expressed by saying that variables range over propositions, or that they take propositions as their values.) Hence they are often called propositional variables. It is assumed that every proposition is either true or false and that no proposition is both true and false. Truth and falsity are said to be the truth values of propositions. The function of an operator is to form a new proposition from one or more given propositions, called the arguments of the operator. The operators $\sim$, $\cdot$, $\vee$, $\supset$, and $\equiv$ correspond respectively to the English expressions "not," "and," "or," "if . . . , then" (or "implies"), and "is equivalent to," when these are used in the following senses:

Fundamental definitions

1. Given a proposition p, then $\sim p$ ("not p") is to count as false when p is true and true when p is false; "$\sim$" (when thus interpreted) is known as the negation sign, and $\sim p$ as the negation of p.
2. Given any two propositions p and q, then $p \cdot q$ ("p and q") is to count as true when p and q are both true and as false in all other cases (namely, when p is true and q false, when p is false and q true, and when p and q are both false); $p \cdot q$ is said to be the conjunction of p and q; "$\cdot$" is known as the conjunction sign, and its arguments (p, q) as conjuncts.
3. $p \vee q$ ("p or q") is to count as false when p and q are both false and true in all other cases; thus it represents the assertion that at least one of p and q is true. $p \vee q$ is known as the disjunction of p and q; "$\vee$" is the disjunction sign, and its arguments (p, q) are known as disjuncts.
4. $p \supset q$ ("if p [then] q" or "p [materially] implies q") is to count as false when p is true and q is false and as true in all other cases; hence it has the same meaning as "either not-p or q" or as "not both; p and not-q." The symbol "$\supset$" is known as the (material) implication sign, the first argument as the antecedent, and the second as the consequent; $q \supset p$ is known as the converse of $p \supset q$.
5. Finally, $p \equiv q$ ("p is [materially] equivalent to q" or "p if and only if q") is to count as true when p and q have the same truth value (*i.e.,* either when both are true or when both are false), and false when they have different truth values; the arguments of "$\equiv$" (the [material] equivalence sign) are called equivalents.

Brackets are used to indicate grouping; they make it possible to distinguish, for example, between $p \cdot (q \vee r)$ ("both p and either-q-or-r") and $(p \cdot q) \vee r$ ("either both-p-and-q or r"). Precise rules for bracketing are given below.

All PC operators take propositions as their arguments, and the result of applying them is also in each case a proposition. For this reason they are sometimes called proposition-forming operators on propositions or, more briefly, propositional connectives. An operator that, like $\sim$, requires only a single argument is known as a monadic operator; operators that, like all the others listed, require two arguments are known as dyadic.

All PC operators also have the following important characteristic: given the truth values of the arguments, the truth value of the proposition formed by them and the

Truth functionality

operator is determined in every case. An operator that has this characteristic is known as a truth-functional operator, and a proposition formed by such an operator is called a truth function of the operator's argument(s). The truth functionality of the PC operators is clearly brought out by summarizing the above account of them in Table 1. In it, "true" is abbreviated by "1" and "false" by "0," and to the left of the vertical line are tabulated all possible combinations of truth values of the operators' arguments. The columns of 1s and 0s under the various truth functions indicate their truth values for each of the cases; these columns are known as the truth tables of the relevant operators. It should be noted that any column of four 1s or 0s or both will specify a dyadic truth-functional operator. Because there are precisely 2^4 (*i.e.*, 16) ways of forming a string of four symbols each of which is to be either 1 or 0 (1111, 1110, 1101, ... 0000), there are 16 such operators in all; the four that are listed here are only the four most generally useful ones.

Table 1: Truth Table for Most Common Operators

monadic operator		dyadic operators				
p	$\sim p$	$p \quad q$	$p \cdot q$	$p \vee q$	$p \supset q$	$p \equiv q$
1	0	1 1	1	1	1	1
0	1	1 0	0	1	0	0
		0 1	0	1	1	0
		0 0	0	0	1	1

Well-formed formulas (wffs)

Formation rules for PC. In any system of logic it is necessary to specify which sequences of symbols are to count as acceptable formulas—or, as they are usually called, well-formed formulas (wffs). Rules that specify this are called formation rules. From an intuitive point of view, it is desirable that the wffs of PC be just those sequences of PC symbols that, in terms of the interpretation given above, make sense and are unambiguous; and this can be ensured by stipulating that the wffs of PC are to be all those expressions constructed in accordance with the following PC formation rules, and only these:

FR1. A variable standing alone is a wff.
FR2. If α is a wff, so is $\sim\alpha$.
FR3. If α and β are wffs, $(\alpha \cdot \beta)$, $(\alpha \vee \beta)$, $(\alpha \supset \beta)$, and $(\alpha \equiv \beta)$ are wffs.

(In these rules α and β are variables representing arbitrary formulas of PC. They are not themselves symbols of PC but are used in discoursing about PC. Such variables are known as metalogical variables. For further explanation, see below *Metalogic*.) It should be noted that the rules, though designed to ensure unambiguous sense for the wffs of PC under the intended interpretation, are themselves stated without any reference to interpretation and in such a way that there is an effective procedure for determining, again without any reference to interpretation, whether any arbitrary string of symbols is a wff or not. (An effective procedure is one that is "mechanical" in nature and can always be relied on to give a definite result in a finite number of steps. The notion of effectiveness plays an important role in formal logic.)

Examples of wffs are: p; $\sim q$; $\sim(p \cdot q)$, "not both p and q"; $[\sim p \vee (q \equiv p)]$, "either not p or else q is equivalent to p."

For greater ease in writing or reading formulas, the formation rules are often relaxed. The following relaxations are common: (1) Brackets enclosing a complete formula may be omitted. (2) The typographical style of brackets may be varied within a formula to make the pairing of brackets more evident to the eye. (3) Conjunctions and disjunctions may be allowed to have more than two arguments—for example, $p \cdot (q \supset r) \cdot \sim r$ may be written instead of $[p \cdot (q \supset r)] \cdot \sim r$. (The conjunction $p \cdot q \cdot r$ is then interpreted to mean that p, q, and r are all true, $p \vee q \vee r$ to mean that at least one of p, q, and r is true, and so forth.)

Validity in PC. Given the standard interpretation, a wff of PC becomes a sentence, true or false, when all its variables are replaced by actual sentences. Such a wff is therefore a proposition form in the sense explained above and hence is valid if and only if all its instances express true propositions. A wff of which all instances are false is said to be unsatisfiable, and one with some true and some false instances is said to be contingent.

An important problem for any logical system is the decision problem for the class of valid wffs of that system (sometimes simply called the decision problem for the system). This is the problem of finding an effective procedure, in the sense explained above in *Formation rules for PC*, for testing the validity of any wff of the system. Such a procedure is called a decision procedure. For some systems a decision procedure can be found; the decision problem for a system of this sort is then said to be solvable, and the system is said to be a decidable one. For other systems it can be proved that no decision procedure is possible; the decision problem for such a system is then said to be unsolvable, and the system is said to be an undecidable one.

Decision procedure with truth tables

PC is a decidable system. In fact, several decision procedures for it are known. Of these the simplest and most important theoretically (though not always the easiest to apply in practice) is the method of truth tables, which will now be explained briefly. Since all the operators in a wff of PC are truth-functional, in order to discover the truth value of any instance of such a wff, it is unnecessary to consider anything but the truth values of the sentences replacing the variables. In other words, the assignment of a truth value to each of the variables in a wff uniquely determines a truth value for the whole wff. Since there are only two truth values and each wff contains only a finite number of variables, there are only a finite number of truth-value assignments to the variables to be considered (if there are n distinct variables in the wff, there are 2^n such assignments); these can easily be systematically tabulated. For each of these assignments the truth tables for the operators then enable one to calculate the resulting truth value of the whole wff; and if and only if this truth value is truth in each case is the wff valid. As an example, $[(p \supset q) \cdot r] \supset [(\sim r \vee p) \supset q]$ may be tested for validity. This formula states that "if one proposition implies a second one, and a certain third proposition is true, then if either that third proposition is false or the first is true, the second is true."

The calculation is shown in Table 2. As before, 1 represents truth and 0 falsity. Since the wff contains three variables, there are 2^3 (*i.e.*, 8) different assignments to the variables to be considered, which therefore generate the eight lines of the table. These assignments are tabulated to the left of the vertical line. The numbers in parentheses at the foot indicate the order in which the steps (from 1 through 6) are to be taken in determining the truth values (1 or 0) to be entered in the table. Thus column 1, falling under the symbol $\supset$, sets down the values of $p \supset q$ for each assignment, obtained from the columns under p and q by the truth table for $\supset$; column 2, for $(p \supset q) \cdot r$, is then obtained by employing the values in column 1 together with those in the column under r by use of the truth table for $\cdot$; . . . until finally column 6, which gives the values for the whole wff, is obtained from columns 2 and 5. This column is called the truth table of the whole wff. Since it consists entirely of 1s, it shows that the wff is true for every assignment given to the variables and is therefore valid. A wff for which the truth table consists entirely of 0s is never satisfied, and a wff for which the truth table contains at least one 1 and at least one 0 is contingent. It follows from the formation rules and from the fact that an initial truth table has been specified for each operator that

Table 2: Test for Validity by Truth Table

p	q	r	$[(p \supset q)$	$\cdot$	$r]$	$\supset$	$[(\sim$	$r \vee$	$p) \supset q]$
1	1	1	1	1	1	1	0	1	1
1	1	0	1	0	1	1	1	1	1
1	0	1	0	0	1	1	0	1	0
1	0	0	0	0	1	1	1	1	0
0	1	1	1	1	1	0	0	1	
0	1	0	1	0	1	1	1	1	
0	0	1	1	1	1	0	0	1	
0	0	0	1	0	1	1	1	0	
			(1)	(2)		(6)	(3)	(4)	(5)

a truth table can be constructed for any given wff of PC.

Construction of valid wffs

Among the more important valid wffs of PC are those of Table 3, all of which can be shown to be valid by a mechanical application of the truth-table method. They can also be seen to express intuitively sound general principles about propositions. For instance, because "not (. . . or ___)" can be rephrased as "neither . . . nor ___," the first De Morgan law can be read as "both p and q if and only if neither not-p nor not-q"; thus it expresses the principle that two propositions are jointly true if and only if neither of them is false.

Table 3: Some Valid Formulas of Propositional Calculus

law	formula
Law of identity	$p \equiv p$
Law of double negation	$p \equiv \sim\sim p$
Law of excluded middle	$p \vee \sim p$
Law of noncontradiction	$\sim(p \cdot \sim p)$
De Morgan laws	$(p \cdot q) \equiv \sim(\sim p \vee \sim q)$
	$(p \vee q) \equiv \sim(\sim p \cdot \sim q)$
Commutative laws	$(p \vee q) \equiv (q \vee p)$
	$(p \cdot q) \equiv (q \cdot p)$
Associative laws	$[(p \vee q) \vee r] \equiv [p \vee (q \vee r)]$
	$[(p \cdot q) \cdot r] \equiv [p \cdot (q \cdot r)]$
Law of transposition	$(p \supset q) \equiv (\sim q \supset \sim p)$
Distributive laws	$[p \cdot (q \vee r)] \equiv [(p \cdot q) \vee (p \cdot r)]$
	$[p \vee (q \cdot r)] \equiv [(p \vee q) \cdot (p \vee r)]$
Law of permutation	$[p \supset (q \supset r)] \equiv [q \supset (p \supset r)]$
Law of syllogism	$(p \supset q) \supset [(q \supset r) \supset (p \supset r)]$
Law of importation	$[p \supset (q \supset r)] \supset [(p \cdot q) \supset r]$
Law of exportation	$[(p \cdot q) \supset r] \supset [p \supset (q \supset r)]$

Whenever, as is the case in most of the examples given, a wff of the form $\alpha \equiv \beta$ is valid, the corresponding wffs $\alpha \supset \beta$ and $\beta \supset \alpha$ are also valid. For instance, because $(p \cdot q) \equiv \sim(\sim p \vee \sim q)$ is valid, so are $(p \cdot q) \supset \sim(\sim p \vee \sim q)$ and $\sim(\sim p \vee \sim q) \supset (p \cdot q)$.

Moreover, although $p \supset q$ does not mean that q can be deduced from p, yet whenever a wff of the form $\alpha \supset \beta$ is valid, the inference form "α, therefore β" is likewise valid. This fact is easily seen from the fact that $\alpha \supset \beta$ means the same as "not both: α and not-β"; for, as was noted above, whenever the latter is a valid proposition form, "α, therefore β" is a valid inference form.

Let α be any wff. If any variable in it is now uniformly replaced by some wff, the resulting wff is called a substitution-instance of α. Thus $[p \supset (q \vee \sim r)] \equiv [\sim(q \vee \sim r) \supset \sim p]$ is a substitution-instance of $(p \supset q) \equiv (\sim q \supset \sim p)$, obtained from it by replacing q uniformly by $(q \vee \sim r)$. It is an important principle that, whenever a wff is valid, so is every substitution-instance of it (the rule of [uniform] substitution).

A further important principle is the rule of substitution of equivalents. Two wffs, α and β, are said to be equivalents when $\alpha \equiv \beta$ is valid. (The wffs α and β are equivalents if and only if they have identical truth tables.) The rule states that, if any part of a wff is replaced by an equivalent of that part, the resulting wff and the original are also equivalents. Such replacements need not be uniform. The application of this rule is said to make an equivalence transformation.

Interdefinability of operators. The rules that have just been stated would enable the first De Morgan law listed in Table 3 to transform any wff containing any number of occurrences of $\cdot$ into an equivalent wff in which $\cdot$ does not appear at all but in place of it certain complexes of $\sim$ and $\vee$ arise. Similarly, since $\sim p \vee q$ has the same truth table as $p \supset q$, $(p \supset q) \equiv (\sim p \vee q)$ is valid, and any wff containing $\supset$ can therefore be transformed into an equivalent wff containing $\sim$ and $\vee$ but not $\supset$. And, since $(p \equiv q) \equiv [(p \supset q) \cdot (q \supset p)]$ is valid, any wff containing $\equiv$ can be transformed into an equivalent containing $\supset$ and $\cdot$ but not $\equiv$, and thus in turn by the previous steps it can be further transformed into one containing $\sim$ and $\vee$ but neither $\equiv$ nor $\supset$ nor $\cdot$. Thus, for every wff of PC there is an equivalent wff, expressing precisely the same truth function, in which the only operators are $\sim$ and $\vee$, though the meaning of this wff will usually be much less clear than that of the original.

An alternative way of presenting PC, therefore, is to begin with the operators $\sim$ and $\vee$ only and to define the others in terms of these. The operators $\sim$ and $\vee$ are then said to be primitive. If "$=_{Df}$" is used to mean "is defined as," then the relevant definitions can be set down as follows:

Alternative primitives

$$(\alpha \cdot \beta) =_{Df} \sim(\sim\alpha \vee \sim\beta)$$
$$(\alpha \supset \beta) =_{Df} (\sim\alpha \vee \beta)$$
$$(\alpha \equiv \beta) =_{Df} [(\alpha \supset \beta) \cdot (\beta \supset \alpha)]$$

in which α and β are any wffs of PC. These definitions are not themselves wffs of PC, nor is $=_{Df}$ a symbol of PC; they are metalogical statements about PC, used to introduce the new symbols $\cdot$, $\supset$, and $\equiv$ into the system. If PC is regarded as a purely uninterpreted system, the expression on the left in a definition is simply a convenient abbreviation of the expression on the right. If, however, PC is thought of as having its standard interpretation, the meanings of $\sim$ and $\vee$ will first of all have been stipulated by truth tables, and then the definitions will lay it down that the expression on the left is to be understood as having the same meaning (*i.e.*, the same truth table) as the expression on the right. It is easy to check that the truth tables obtained in this way for $\cdot$, $\supset$, and $\equiv$ are precisely the ones that were originally stipulated for them.

An alternative to taking $\sim$ and $\vee$ as primitive is to take $\sim$ and $\cdot$ as primitive and to define $(\alpha \vee \beta)$ as $\sim(\sim\alpha \cdot \sim\beta)$, to define $(\alpha \supset \beta)$ as $\sim(\alpha \cdot \sim\beta)$, and to define $(\alpha \equiv \beta)$ as before. Yet another possibility is to take $\sim$ and $\supset$ as primitive and to define $(\alpha \vee \beta)$ as $(\sim\alpha \supset \beta)$, $(\alpha \cdot \beta)$ as $\sim(\alpha \supset \sim\beta)$, and $(\alpha \equiv \beta)$ as before. In each case, precisely the same wffs that were valid in the original presentation of the system are still valid.

Axiomatization of PC. The basic idea of constructing an axiomatic system is that of choosing certain wffs (known as axioms) as starting points and giving rules for deriving further wffs (known as theorems) from them. Such rules are called transformation rules. Sometimes the word "theorem" is used to cover axioms as well as theorems; the word "thesis" is also used for this purpose.

An axiomatic basis consists of:

Axiomatic basis and interpretation

(1) a list of primitive symbols, together with any definitions that may be thought convenient,
(2) a set of formation rules, specifying which sequences of symbols are to count as wffs,
(3) a list of wffs selected as axioms, and
(4) a set of (one or more) transformation rules, which enable new wffs (theorems) to be obtained by performing certain specified operations on axioms or previously obtained theorems.

Definitions, where they occur, can function as additional transformation rules, to the effect that, if in any theorem any expression of the form occurring on one side of a definition is replaced by the corresponding expression of the form occurring on the other side, the result is also to count as a theorem. A proof or derivation of a wff α in an axiomatic system S is a sequence of wffs of which the last is α itself and each wff in the sequence is either an axiom of S or is derived from some axiom(s) or some already-derived theorem(s) or both by one of the transformation rules of S. A wff is a theorem of S if and only if there is a proof of it in S.

Care is usually taken, in setting out an axiomatic basis, to avoid all reference to interpretation. It must be possible to tell purely from the construction of a wff whether it is an axiom or not. Moreover, the transformation rules must be so formulated that there is an effective way of telling whether any purported application of them is a correct application or not, and hence whether a purported proof of a theorem really is a proof or not. An axiomatic system will then be a purely formal structure, on which any one of a number of interpretations, or none at all, may be imposed without affecting the question of which wffs are theorems. Normally, however, an axiomatic system is constructed with a certain interpretation in mind; the transformation rules are so formulated that under that interpretation they are validity-preserving (*i.e.*, the results of applying them to valid wffs are always themselves valid wffs); and the chosen axioms either are valid wffs or are expressions of principles of which it is desired to explore the consequences.

Properties of an axiomatic system: PM

Probably the best-known axiomatic system for PC is the following one, which, since it is derived from *Principia Mathematica*, by Whitehead and Russell, is often called PM:

Primitive symbols: $\sim$, $\vee$, (,), and an infinite set of variables, p, q, r, . . . (with or without numerical subscripts).

Definitions of $\cdot$, $\supset$, $\equiv$ as above (*Interdefinability of operators*).

Formation rules as above (*Formation rules for PC*), except that formation rule 3 can be abbreviated to "If α and β are wffs, $(\alpha \vee \beta)$ is a wff," since $\cdot$, $\supset$, and $\equiv$ are not primitive.

Axioms:

1. $(p \vee p) \supset p$
2. $q \supset (p \vee q)$
3. $(p \vee q) \supset (q \vee p)$
4. $(q \supset r) \supset [(p \vee q) \supset (p \vee r)]$

Axiom 4 can be read, "If q implies r, then, if either p or q, either p or r."

Transformation rules:

1. The result of uniformly replacing any variable in a theorem by any wff is a theorem (rule of substitution).
2. If α and $(\alpha \supset \beta)$ are theorems, then β is a theorem (rule of detachment, or modus ponens).

Relative to a given criterion of validity, an axiomatic system is sound if every theorem is valid, and it is complete (or, more specifically, weakly complete) if every valid wff is a theorem. The axiomatic system PM can be shown to be both sound and complete relative to the criterion of validity given in *Validity in PC* above.

An axiomatic system is consistent if, whenever a wff α is a theorem, $\sim\alpha$ is not a theorem. (In terms of the standard interpretation, this means that no pair of theorems can ever be derived one of which is the negation of the other.) It is strongly complete if the addition to it (as an extra axiom) of any wff whatever that is not already a theorem would make the system inconsistent. Finally, an axiom or transformation rule is independent (in a given axiomatic system) if it cannot be derived from the remainder of the basis (or—which comes to the same thing—if its omission from the basis would make the derivation of certain theorems impossible). It can, moreover, be shown that PM is consistent and strongly complete and that each of its axioms and transformation rules is independent.

A considerable number of other axiomatic bases for PC, each having all the above properties, are known. The task of proving that they have these properties belongs to metalogic.

Axiom schemata

In some standard expositions of formal logic, the place of axioms is taken by axiom schemata, which, instead of presenting some particular wff as an axiom, lay it down that any wff of a certain form is an axiom. For example, in place of axiom 1 in PM one might have the axiom schema "Every wff of the form $(\alpha \vee \alpha) \supset \alpha$ is an axiom"; and analogous schemata can be substituted for the other axioms. The number of axioms would then become infinite, but, on the other hand, the rule of substitution would no longer be needed, and modus ponens could be the only transformation rule. This method makes no difference to the theorems that can be derived; but in some branches of logic (though not in PC) it is simpler to work with axiom schemata rather than with particular axioms and substitution rules. Having an infinite number of axioms causes no trouble provided that there is an effective way of telling whether a wff is an axiom or not.

Special systems of PC. *Partial systems of PC.* Various propositional calculi have been devised to express a narrower range of truth functions than those of PC as expounded above. Of these, the one that has been most fully studied is the pure implicational calculus (PIC), in which the only operator is $\supset$, and the wffs are precisely those wffs of PC that can be built up from variables, $\supset$, and brackets alone. Formation rules 2 and 3 of *Formation rules for PC* (above) are therefore replaced by the rule that if α and β are wffs, $(\alpha \supset \beta)$ is a wff. As in ordinary PC, $p \supset q$ is interpreted as "p materially implies q"—*i.e.*, as true except when p is true but q false. The truth-table test of validity can then be straightforwardly applied to wffs of PIC.

The task of axiomatizing PIC is that of finding a set of valid wffs, preferably few in number and relatively simple in structure, from which all other valid wffs of the system can be derived by straightforward transformation rules. The best-known basis, which was formulated in 1930, has the transformation rules of substitution and modus ponens (as in PM) and the following axioms:

1. $p \supset (q \supset p)$
2. $[(p \supset q) \supset p] \supset p$
3. $(p \supset q) \supset [(q \supset r) \supset (p \supset r)]$

Axioms 1 and 3 are closely related to axioms 2 and 4 of PM respectively (see above *Axiomatization of PC*). It can be shown that the basis is complete and that each axiom is independent.

Under the standard interpretation, the above axioms can be thought of as expressing the following principles: (1) "If a proposition p is true, then if some arbitrary proposition q is true, p is (still) true." (2) "If the fact that a certain proposition p implies some arbitrary proposition q implies that p itself is true, then p is (indeed) true." (3) "If one proposition (p) implies a second (q), then if that second proposition implies a third (r), the first implies the third." The completeness of the basis is, however, a formal matter, not dependent on these or any other readings of the formulas.

An even more economical complete basis for PIC contains the same transformation rules but the sole axiom

$$[(p \supset q) \supset r] \supset [(r \supset p) \supset (s \supset p)].$$

It has been proved that this is the shortest possible single axiom that will give a complete basis for PIC with these transformation rules.

Since PIC contains no negation sign, the previous account of consistency is not significantly applicable to it. Alternative accounts of consistency have, however, been proposed, according to which a system is consistent (1) if no wff consisting of a single variable is a theorem or (2) if not every wff is a theorem. The bases stated are consistent in these senses.

Nonstandard versions of PC. Qualms have sometimes been expressed about the intuitive soundness of some formulas that are valid in "orthodox" PC, and these qualms have led some logicians to construct a number of propositional calculi that deviate in various ways from PC as expounded above.

The true-false dichotomy: its problems

Underlying ordinary PC is the intuitive idea that every proposition is either true or false, an idea that finds its formal expression in the stipulation that variables shall have two possible values only—namely, 1 and 0. (For this reason the system is often called the two-valued propositional calculus.) This idea has been challenged on various grounds. Following a suggestion made by Aristotle, some logicians have maintained that propositions about those events in the future that may or may not come to pass are neither true nor false but "neuter" in truth value. Aristotle's example, which has received much discussion, is "There will be a sea battle tomorrow." It has also been maintained, by the English philosopher Sir Peter Strawson and others, that, for propositions with subjects that do not have anything actual corresponding to them—such as "The present king of France is wise" (assuming that France has no king) or "All John's children are asleep" (assuming that John has no children)—the question of truth or falsity "does not arise." Another view is that a third truth value (say "half-truth") ought to be recognized as existing intermediate between truth and falsity; thus it has been advanced that certain familiar states of the weather make the proposition "It is raining" neither definitely true nor definitely false but something in between the two.

The issues raised by the above examples no doubt differ significantly, but they all suggest a threefold rather than a twofold division of propositions and hence the possibility of a logic in which the variables may take any of three values (say 1, $\frac{1}{2}$, and 0), with a consequent revision of the standard PC account of validity. Several such three-valued logics have been constructed and investigated; a brief account will be given here of one of them, in which the

most natural interpretation of the additional value (½) is as "half-true," with 1 and 0 representing truth and falsity as before. The formation rules are as they were for orthodox PC, but the meaning of the operators is extended to cover cases in which at least one argument has the value ½ by the five entries in Table 4. (Adopting one of the three values of the first argument, p, given in the leftmost column [1, ½, or 0] and, for the dyadic operators, one of the three values of the second, q, in the top row—above the line—one then finds the value of the whole formula by reading across for p and down for q.) It will be seen that these tables, due to the Polish logician Jan Łukasiewicz, are the same as the ordinary two-valued ones when the arguments have the values 1 and 0. The other values are intended to be intuitively plausible extensions of the principles underlying the two-valued calculus to cover the cases involving half-true arguments. Clearly, these tables enable a person to calculate a determinate value (1, ½, or 0) for any wff, given the values assigned to the variables in it; a wff is valid in this calculus if it has the value 1 for every assignment to its variables. Since the values of formulas when the variables are assigned only the values 1 and 0 are the same as in ordinary PC, every wff that is valid in the present calculus is also valid in PC. Some wffs that are valid in PC are, however, now no longer valid. An example is $(p \vee \sim p)$, which, when p has the value ½, also has the value ½. This reflects the idea that if one admits the possibility of a proposition's being half-true, he can no longer hold of every proposition without restriction that either it or its negation is true.

Validity of wffs in three-valued logic

Given the truth tables for the operators in Table 4, it is possible to take $\sim$ and $\supset$ as primitive and to define $(\alpha \vee \beta)$ as $[(\alpha \supset \beta) \supset \beta]$—though not as $(\sim\alpha \supset \beta)$ as in ordinary PC; $(\alpha \cdot \beta)$ as $\sim(\sim\alpha \vee \sim\beta)$; and $(\alpha \equiv \beta)$ as $[(\alpha \supset \beta) \cdot (\beta \supset \alpha)]$. With these definitions as given, all valid wffs constructed from variables and $\sim$, $\cdot$, $\vee$, $\supset$, and $\equiv$ can be derived by substitution and modus ponens from the following four axioms:

1. $p \supset (q \supset p)$
2. $(p \supset q) \supset [(q \supset r) \supset (p \supset r)]$
3. $[(p \supset \sim p) \supset p] \supset p$
4. $(\sim p \supset \sim q) \supset (q \supset p)$

Other three-valued logics can easily be constructed. For example, the above tables might be modified so that $\sim$½, ½ $\supset$ 0, ½ $\equiv$ 0, and 0 $\equiv$ ½ all have the value 0 instead of ½ as before, leaving everything else unchanged. The same definitions are then still possible, but the list of valid formulas is different; *e.g.*, $\sim\sim p \supset p$, which was previously valid, now has the value ½ when p has the value ½. This system can also be successfully axiomatized. Other calculi with more than three values can also be constructed along analogous lines.

Other nonstandard calculi have been constructed by beginning with an axiomatization instead of a definition of validity. Of these, the best-known is the intuitionistic calculus, devised by Arend Heyting, one of the chief representatives of the intuitionist school of mathematicians, a group of theorists who deny the validity of certain types of proof used in classical mathematics (see MATHEMATICS, THE FOUNDATIONS OF). At least in certain contexts, members of this school regard the demonstration of the falsity of the negation of a proposition (a proof by reductio ad absurdum) as insufficient to establish the truth of the proposition in question. Thus they regard $\sim\sim p$ as an inadequate premise from which to deduce p and hence do not accept the validity of the law of double negation in the form $\sim\sim p \supset p$. They do, however, regard a demonstration that p is true as showing that the negation of p is false and hence accept $p \supset \sim\sim p$ as valid. For somewhat similar reasons, these mathematicians also refuse to accept the validity of arguments based on the law of excluded middle $(p \vee \sim p)$. The intuitionistic calculus aims at presenting in axiomatic form those and only those principles of propositional logic that are accepted as sound in intuitionist mathematics. In this calculus, $\sim$, $\cdot$, $\vee$, and $\supset$ are all primitive, the transformation rules as before are substitution and modus ponens, and the axioms are the following:

Intuitionistic calculus

1. $p \supset (p \cdot p)$
2. $(p \cdot q) \supset (q \cdot p)$
3. $(p \supset q) \supset [(p \cdot r) \supset (q \cdot r)]$
4. $[(p \supset q) \cdot (q \supset r)] \supset (p \supset r)$
5. $p \supset (q \supset p)$
6. $[p \cdot (p \supset q)] \supset q$
7. $p \supset (p \vee q)$
8. $(p \vee q) \supset (q \vee p)$
9. $[(p \supset r) \cdot (q \supset r)] \supset [(p \vee q) \supset r]$
10. $\sim p \supset (p \supset q)$
11. $[(p \supset q) \cdot (p \supset \sim q)] \supset \sim p$

From this basis neither $p \vee \sim p$ nor $\sim\sim p \supset p$ can be derived, though $p \supset \sim\sim p$ can. In this respect this calculus resembles the second of the three-valued logics described above. It is, however, not possible to give a truth-table account of validity—no matter how many values are used—that will bring out as valid precisely those wffs that are theorems of the intuitionistic calculus and no others.

Natural deduction method in PC. PC is often presented by what is known as the method of natural deduction. Essentially this consists of a set of rules for drawing conclusions from hypotheses (assumptions, premises) represented by wffs of PC and thus for constructing valid inference forms. It also provides a method of deriving from these inference forms valid proposition forms, and in this way it is analogous to the derivation of theorems in an axiomatic system. One such set of rules is presented in Table 5 (and there are various other sets that yield the same results).

Rules of inference and their application

Table 5: Sample Set of Rules for the Natural Deduction Method in Propositional Calculus

rule	given	one may then conclude
1. Modus ponens	α and $\alpha \supset \beta$	β
2. Modus tollens	$\sim\beta$ and $\alpha \supset \beta$	$\sim\alpha$
3. Double negation	α	$\sim\sim\alpha$
	$\sim\sim\alpha$	α
4. Conjunction introduction	α and β	$\alpha \cdot \beta$
5. Conjunction elimination	$\alpha \cdot \beta$	α and also β
6. Disjunction introduction	either α or β separately	$\alpha \vee \beta$
7. Disjunction elimination	$\alpha \vee \beta$, a derivation of γ from α, and a derivation of γ from β	γ
8. Conditional proof	a derivation of β from the hypothesis α (perhaps with the help of other hypotheses)	$\alpha \supset \beta$ as a conclusion from these other hypotheses (if any)
9. Reductio ad absurdum	a derivation $\beta \cdot \sim\beta$ from the hypothesis α (perhaps with the help of other hypotheses)	$\sim\alpha$ as a conclusion from these other hypotheses (if any)

A natural deduction proof is a sequence of wffs beginning with one or more wffs as hypotheses; fresh hypotheses may also be added at any point in the course of a proof. The rules may be applied to any wff or group of wffs, as appropriate, that have already occurred in the sequence. In the case of rules 1–7, the conclusion is said to depend on all of those hypotheses that have been used in the series of applications of the rules that have led to this conclusion; *i.e.*, it is claimed simply that the conclusion follows from these hypotheses, not that it holds in its own right. An application of rule 8 or rule 9, however, reduces by one the number of hypotheses on which the conclusion depends; and a hypothesis so eliminated is said to be a discharged hypothesis. In this way a wff may be reached that depends on no hypotheses at all. Such a wff is a theorem of logic. It can be shown that those theorems derivable by the rules stated above—together with the definition of $\alpha \equiv \beta$

Table 4: Truth Values for Common Operators in a Three-Valued Logic

p	q	negation $(\sim p)$	conjunction $(p \cdot q)$	disjunction $(p \vee q)$	implication $(p \supset q)$	equivalence $(p \equiv q)$
1	1	0	1	1	1	1
1	½	0	½	1	½	½
1	0	0	0	1	0	0
½	1	½	½	1	1	½
½	½	½	½	½	1	1
½	0	½	0	½	½	½
0	1	1	0	1	1	0
0	½	1	0	½	1	½
0	0	1	0	0	1	1

as $(\alpha \supset \beta) \cdot (\beta \supset \alpha)$—are precisely the valid wffs of PC. A set of natural deduction rules yielding as theorems all the valid wffs of a system is complete (with respect to that system) in a sense obviously analogous to that in which an axiomatic basis was said to be complete in *Axiomatization of PC* (above).

Sample proof of a theorem of logic

As an illustration, the formula $[(p \supset q) \cdot (p \supset r)] \supset [p \supset (q \cdot r)]$ will be derived as a theorem of logic by the natural deduction method. (The sense of this formula is that, if a proposition $[p]$ implies each of two other propositions $[q, r]$, then it implies their conjunction.) Explanatory comments follow the proof.

1	(1)	$(p \supset q) \cdot (p \supset r)$	hypothesis
2	(2)	p	hypothesis
1	(3)	$p \supset q$	1, conjunction elimination
1	(4)	$p \supset r$	1, conjunction elimination
1, 2	(5)	q	2, 3, modus ponens
1, 2	(6)	r	2, 4, modus ponens
1, 2	(7)	$q \cdot r$	5, 6, conjunction introduction
1	(8)	$p \supset (q \cdot r)$	2, 7, conditional proof
	(9)	$[(p \supset q) \cdot (p \supset r)] \supset [p \supset (q \cdot r)]$	1, 8, conditional proof

The figures in parentheses immediately preceding the wffs are simply for reference. To the right is indicated either that the wff is a hypothesis or that it is derived from the wffs indicated by the rules stated. On the left are noted the hypotheses on which the wff in question depends (either the first or the second line of the derivation, or both). Note that since 8 is derived by conditional proof from hypothesis 2 and from 7, which is itself derived from hypotheses 1 and 2, 8 depends only on hypothesis 1, and hypothesis 2 is discharged. Similarly, 9 depends on no hypotheses and is therefore a theorem.

By varying the above rules it is possible to obtain natural deduction systems corresponding to other versions of PC. For example, if the second part of the double negation rule is omitted and the rule is added that, given $\alpha \cdot \sim\alpha$, one may then conclude β, it can be shown that the theorems then derivable are precisely the theorems of the intuitionistic calculus.

THE PREDICATE CALCULUS

Propositions may also be built up, not out of other propositions but out of elements that are not themselves propositions. The simplest kind to be considered here are propositions in which a certain object or individual (in a wide sense) is said to possess a certain property or characteristic; *e.g.*, "Socrates is wise" and "The number 7 is prime." Such a proposition contains two distinguishable parts: (1) an expression that names or designates an individual and (2) an expression, called a predicate, that stands for the property that that individual is said to possess. If $x, y, z, \ldots$ are used as individual variables (replaceable by names of individuals) and the symbols φ (phi), ψ (psi), χ (chi), ... as predicate variables (replaceable by predicates), the formula φx is used to express the form of the propositions in question. Here x is said to be the argument of φ; a predicate (or predicate variable) with only a single argument is said to be a monadic, or one-place, predicate (variable). Predicates with two or more arguments stand not for properties of single individuals but for relations between individuals. Thus the proposition "Tom is a son of John" is analyzable into two names of individuals ("Tom" and "John") and a dyadic or two-place predicate ("is a son of"), of which they are the arguments; and the proposition is thus of the form φxy. Analogously, "... is between ... and ..." is a three-place predicate, requiring three arguments, and so on. In general, a predicate variable followed by any number of individual variables is a wff of the predicate calculus. Such a wff is known as an atomic formula, and the predicate variable in it is said to be of degree n, if n is the number of individual variables following it. The degree of a predicate variable is sometimes indicated by a superscript—*e.g.*, φxyz may be written as $\varphi^3 xyz$; $\varphi^3 xy$ would then be regarded as not well formed. This practice is theoretically more accurate, but the superscripts are commonly omitted for ease of reading when no confusion is likely to arise.
